ROMAN LIFE AND MANNERS UNDER THE EARLY EMPIRE

By
LUDWIG FRIEDLÄNDER

Authorized Translation of the Seventh Enlarged
and Revised Edition of the *Sittengeschichte Roms*

by
LEONARD A. MAGNUS, LL.B.

LONDON
GEORGE ROUTLEDGE & SONS LIMITED
NEW YORK: E. P. DUTTON & CO

Author's Preface to the Seventh Edition

THE text of this edition of my ROMAN LIFE AND MANNERS is essentially the same as that of the sixth edition ; but, at the request of my publisher, the footnotes and *excursus* have been omitted, and many passages have been supplemented, shortened, corrected or amplified ; the sections on Christianity and the belief in immortality have been in part revised. • I have to acknowledge the help afforded me by several scholars whose criticisms have suggested to me many of these alterations, viz. Messrs. A. Conrady, O. Crutz, O. Cuntz, O. Hirschfeld, Chr. Hülsen, Br. Keil, J. Kromayer, Ad. Michaelis, K. J. Neumann, W. Oechsli, E. Schürer, W. Spiegelberg.

Strassburg.

CHRONOLOGICAL TABLE OF THE MOST IMPORTANT DATES, HISTORICAL AND LITERARY, DURING THE EMPIRE

A.U.C. 723 —31 B.C.	Battle of Actium, September 2.	The Epodes of Horace (born 65 B.C.)

	cletian's abdication in Nico-		
	media. Maximian's abdic-		
	ation at Milan May 1. Dio-		
	cletian at Salona (Spalato).		
	His palace there.		

Chronological Table

xix

A.D. 306	Constantius Chlorus dies; succeeded by his son Constantine. Maxentius' usurpation.	
307	Licinius raised to purple at Carnuntum.	Lactantius' <i>Institutiones Divinae</i> 307-310.
310	Maximian dies. Galerius' Edict of Tolerance.	
311	Galerius dies.	Collection of the <i>Lives of the Emperors</i> in this epoch.
312	Constantine's victory at the Milvian bridge. Maxentius dies.	
313	Religious Edict of Milan. Diocletian, Maximian dies. Licinius Lord in the East.	
324	Licinius dies.	
324-337	Constantine sole Emperor.	
326	Crispus dies.	
327	Fausta dies.	
330	Consecration of Constantinople May 11.	
337	Constantine dies.	<i>Itinerarium Burdigalense (Hierosolymitanum)</i> 333

A.D. 337-361	Constantine II. Constantius. Constans.	Iamblichus (pupil of Porphyry) dies about 330.	Firmicus Maternus, 336/7, <i>De Mathesi</i> ; after conversion, 346/7, <i>De errore profanarum religionum</i> .
357	Julian conquers Alemanni at Strasburg.	Eusebius (Bishop of Caesarea 315) continues his <i>Chronicle</i> to 325, then the <i>Ecclesiastical History</i> and <i>Life of Constantine</i> ; dies 340	Aelius Donatus, the grammarian and rhetor in Rome about 350.
361-363	Julian (born 331) dies June 27.	Original of <i>Expositio totius mundi et gentium</i> 350-353.	Palladius on Agriculture? District gazetteers of Rome: <i>Notitia</i> , 334-357; <i>Curiosum</i> after 357.
363-4	Jovian.	Gregory of Nazianzus and Basil of Caesarea study at Athens 355. The Sophist Themistius Senator at Constantinople 355; teacher of Arcadius 387.	S. Aurelius Victor's <i>Caesars to Death of Constantine</i> . Eutropius' <i>History</i> down to 364, dedicated to Valens. Julius Obsequens' <i>List of Prodigies</i> ?

A.D.			
	DIVISION OF EMPIRE.	Libanius (born 314) in Antioch after 352, dies 392/3.	
364-375	Valentinian I in the West.		Hilarius, Bishop of Poitiers, dies 368.
364-378	Valens in the East.	Himerius (316-368) Julian's Secretary 362.	Lucifer, Bishop of Cagliari dies 371.
375-383	Gratian.	Julian's <i>Caesares</i> , and anti-Christian writ- ings 362.	Rufus Festus Avienus, geographical poems.
383-392	Valentinian II. Theodosius I (ruler of East after 379).	Basil dies 380 Gregory dies 390.	D. Ausonius Magnus (310 - 390, Consul 379), <i>Mosella</i> 370.
392-395	Sole Ruler.		Damasus (305-384) a Christian poet.
395-408	Arcadius in the East.	Chrysostomus dies, 407.	<i>Notitia Dignitatum</i> (a Byzantine manual of State) end of fourth century. Quintus Aurelius Symma- chus (about 340- 402), <i>Præf. urbi</i> 384/5
395-423	Honorius in the West (at first under regency of Stilicho).	Nonnus, poet at begin- ning of fifth cen- tury.	<i>Speeches and Letters</i> (two-thirds of latter 395-402).
406	Visigoths in Gaul.	Eunapius (born 346) continues Dexippus' history down to 404, and writes <i>Lives of the Philosophers</i> .	Ammianus Marcellinus (330-400), <i>Roman History from 96-378</i> .
410	Rome sacked by Alaric.	Olympiodorus' <i>History of 407-425</i> .	Flavius Vegetius Rena- tus dedicates work on the <i>Art of War</i> to Theodosius I be- tween 384 and 395.
415	Establishment of Empire of the Visi- goths.	The philosopher Hy- patia murdered at Alexandria 415.	Ambrosius (340-397) Bishop of Milan 374.
430	Vandals rule in Africa.	Plutarch, head of the Neo-Platonic School at Athens, dies be- tween 431 and 435.	St. Jerome (340-420) translates the Bible into Latin 390-405 (whence the present Vulgate), and trans- lates and comple- ments the <i>History of the World</i> of Euse- bius down to 378.
		Syrianus succeeds him.	Rufinus (345 - 410) translates Origen and Eusebius.
		Proclus succeeds him (412-485).	Aurelius Prudentius, a Christian poet, 348- 410.
408-450	In the East Theodosius II.		

Chronological Table

xxi

A.D.			
425-455	In the West Valentinian III.	Socrates' <i>Ecclesiastical History</i> of 306-439.	Paulinus (353 - 431) Bishop of Nola 409.
451	Attila defeated by Aetius at Châlons.	Priscus ambassador to Attila 448, writes the Byzantine History up to 474.	Claudianus, a poet at the end of fourth and beginning of fifth century.
452	The Huns in Italy.	Zosimus, <i>History from Augustus to 410.</i>	St. Augustine (354-430) Bishop of Hippo 395. <i>De Civitate Dei</i> (after 410).
453	Attila dies.		Sulpicius Severus (365- 425) finishes his <i>Chronicle of the World</i> 403.
455	Rome taken by the Van- dals.		Macrobius writes the <i>Saturnalia</i> at end of fourth or beginning of fifth century.
456	Avitus.		Marcianus Capella, <i>Artium Liberalium ix Libri</i> , about 400.
457-461	Maorianus.		Rutilius Namatianus' poetical descriptions of travel, 416.
461-465	Libius Severus.		Orosius' <i>History of the World</i> to 417.
465-467	Ricimer.		<i>Law of Citations</i> , 426.
467-472	Anthemius.		Salvianus, about 450, <i>De Gubernatione Dei</i> .
473	Glycerius.		Apollinaris Sidonius, Bishop of Clermont 469/70; poems and letters.
474-475	Iulius Nepos.		Boethius, Consul 510, dies 525; <i>De Conso- latione</i> .
475-476	Romulus Au- gustulus.		Priscianus, grammari- an at Constantinople about 500.
476	End of Western Empire.		Cassiodorus (480-575), Secretary to Theo- doric, writes a chronicle up to 519.
492-525	Theodoric King of Italy.	Johannes Lydus au- thor after 522.	Tribonian (dies 545) edits the <i>Pandects</i> 530-33, and the <i>Co- dex Justinianus</i> .
527-565	Justinian Em- peror of the East.		Isidore Bishop of Seville 570-640, writes <i>Ori- gines</i> , xx books.

Italian landscape and gardens	421-428

CHAPTER I

THE CITY OF ROME

EVEN at the close of the regal period, Rome, as marked by the Servian wall, although considerably enlarged, was little more than a modern country town. Agriculture and cattle-breeding were still carried on inside. The homesteads were mostly of wood and clay, and thatched with straw. The unpaved streets raised clouds of dust in the summer, and, in the winter, were a sea of mire.

The faults in the construction of later Rome were attributed in antiquity to the haste with which the town had been rebuilt after its destruction by the Gauls 390 B.C. The city was irregularly divided, its streets were narrow and tortuous, and the houses crowded. Tiled roofs came in very gradually; shingled roofs were general up to the war with Pyrrhus (284 B.C.)—a proof of the wooded wealth of Italy at that time, which Rome afterwards rapidly consumed in the building of her leasehold houses, lofty, joisted and liable to fires. Rome was slowly ceasing to look like a village even before 310 B.C. The wooden booths of the butchers in the Forum had yielded place to money-changers' offices, but the improvements were so tardy and isolated that, even at the Court of Philip of Macedon, the anti-Roman party was still able to scoff at the ugliness of Italy's capital: neither its private houses nor its public buildings were beautiful. These then for the first time began to be architecturally adorned. Basilicas were erected in place of the booths. A row of stone markets of similar architecture arose round the principal lines of the Forum. In 185 B.C. Marcus Porcius Cato began a reform, followed by Fulvius Nobilior and Sempronius Gracchus in 180 and 170. In the censor's year, 179—a year memorable in architecture—Cato gave Rome a large central market for articles of food, with a domed slaughterhouse in the middle and sale-rooms radiating from it. Quintus Metellus Macedonicus (Consul in 143), built the first 'marble temple,' but probably out of stolen columns and pieces.

R.L.M.

1

B

At a much earlier date—possibly soon after the second Punic War—the dismantling of the fortifications of Rome had disposed of one of the chief obstacles to the extension of the town, and, even under Sulla, it became necessary to push outwards the sacred boundary (the Pomerium). After the time of Sulla, Rome became statelier, inasmuch as the Tabularium (of which fragments exist in the Senators' palace) and other fine edifices were built, but the lie of the streets and frontages remained the same. In 63 B.C. Rome was poorly paved, had zig-zagging hilly streets, tall houses, narrow alleys, and could not compare with Capua, *altera Roma*, the city of the plain, which even in Domitian's time did not stand far behind the capital. Augustus' Rome was a city grown up anyhow. During the five-and-thirty years between Sulla's death and Caesar's murder (78–44 B.C.) Rome had bedecked herself with many magnificent buildings, public and private, in which generals, officers, civil servants and business-men exhibited their riches, and loot from East and West, gained in that epoch of conquest. In the year 44 B.C. there were over one hundred palaces in Rome. Cicero, a quarter of a century afterwards, thought he might call Rome a beautiful and richly adorned city, even though, in Plutarch's opinion, the Roman edifices before the Empire were not comparable with those of Pericles at Athens; and Suetonius is doubtless right in saying that Augustus found the city of Rome unworthy of her imperial dignity.

Under Augustus Roman architecture received a tremendous impetus. The feeling of security, which returned with universal peace, increasing prosperity and population; the great influx of capital, and the lowering of interest from 12 per cent., in 29 B.C., to 4 per cent., not to speak of the Emperor's personal endeavour to endow Rome with the splendour commensurate with the world's sovereign city, were the main causes. He first had the matchless Carrara marble used in huge quantities in building. Most of the improvement of Rome was on a generous scale, in public places and monuments; but many regulations and widenings of the chaotic streets (largely consequent on the ornamentations) were also made. Further, the firm resolve of the monarch reacted also on grandees, capitalists and contractors, so that very soon many gorgeous private houses and palaces sprang into being, and overshadowed the older buildings. At the

solidity of a Piso's palace Augustus was rejoiced ; he was building, he said, for Rome's eternity.

Augustus' wish and example for the architectural reorganization of Rome had no less swift and impressive results than the incentive of some modern rulers in modern towns. At Naples the reign of the Spanish viceroy Pietro de Toledo (1532-1553) heralded a new era of architecture. Sixtus V (1585-1590) impressed his mark on Rome. Gustavus Vasa's rule (1523-1560) secured Stockholm more stone houses than any other northern European city, even London ; his policy was followed out by John III (1568-1592) : in 1582, 429 out of the 658 houses were stone. To the precedent set by Louis XIV after 1661 Paris owed two new cities round St. Sulpice and the Palais Royal, both superior to the old town. In Moscow, where, towards the end of the seventeenth century, roughly carpentered wooden houses were on sale in the markets to replace the hundreds or thousands burnt down, the example of Count Golitsyn's new palace had a great effect ; whilst he was at the head of affairs (1682-1689) no less than 3,000 stone houses were built. Augustus the Strong found Dresden a little city of wood, and converted it into one of stone, the prettiest, according to Lady Montagu (1716) in all Germany. Warsaw redeemed herself from her poverty-stricken condition under Stanislaus Augustus, when he chose the city for his capital, and, together with his magnates, enriched it with numerous palaces and public buildings. Berlin was improved under Frederick William I and Frederick II at great public cost, and private building was also enforced : later, at the close of the Seven Years' War, there was a very brisk epoch of building. Similarly, too, Rome received from her first monarch a new architectural garb, and 'from a city of brick became a city of marble'. Thirty years after the battle of Actium Ovid speaks of 'the Golden Rome, that holds the treasures of the conquered world'. Yet the streets of Rome were altered or improved only to a very slight extent under Augustus. For under Tiberius the complaint was raised that the great height of the houses and narrowness of the streets allowed of no protection against fire, or possibility of escaping to the other side of the road in case of collapse. Nero's fire (in 64 A.D.) owed its enormous extent mainly to 'the narrow tortuous streets and over-heavy houses of old Rome.'

A new Rome arose from the ashes of Nero's Rome, which was burnt down on the anniversary of the Gallic fire, when three out of the fourteen quarters were laid low in six days, and only smouldering remains were left of seven. The houses were now fire-proof up to a certain height, and made of Gabinian and Albanian stone, intervals were left, and less height allowed, the districts were made regular, the streets straighter and arcaded. At Nero's death (68 A.D.) these operations were naturally not completed. Vespasian found the city marred by the ruins of fires and fallen houses and an inscription of 71 A.D. boasts of his having repaired the neglected streets of former ages, at his own cost.

Yet even the new town (which was more than two-thirds of the whole) did not wholly remedy the old evils. Authorities agree that even after the great fire houses were very lofty. Juvenal says there were windows, whence objects in the streets were but dimly seen. If one were to add to the extent and compass of Rome the height of the houses, says Pliny, no city in the world were as great. In compass Alexandria was larger (in the year 74 Rome was calculated to be 13,200 paces, and Alexandria 16,360); but in this town the houses were not as tall. Aristides says in his Laudation of Rome (145 A.D.) that even as a strong man lifts others up over him and carries them, so Rome bears cities on cities, raised above herself. Were they outspread on the plain, the whole breadth of Italy from sea to sea were one continuous city. As a fact, the motives for piling up storeys were as strong as ever: the site for Caesar's Forum had cost over £875,000 compensation to tenants and ground landlords. Rome had loftier houses than modern capitals. Whilst at Berlin the Building Ordinances of 1860 allow only 36 feet, in a street of the same width, as the maximum height, and only corresponding increases, and at Vienna only 45 feet (at the most four storeys) and at Paris at the most 63·6 feet to a street of similar width, Augustus at Rome fixed the maximum height of the frontages at 70 Roman feet, which gave room for six to seven storeys; Trajan reduced this to 60 Roman feet, that is about five or six storeys. Neither regulation was much regarded; neither extended to courtyards and the backs of the houses; which, no doubt, were built much taller: Martial tells of a 'poor devil whose attic is two hundred

steps up'. These heights were independent of the breadth of the street, an aspect in which Rome lagged behind modern capitals. Whilst in Berlin the average breadth of streets is 70 feet, in Rome the larger streets were only 16 to 19 feet, that is, less than the least on the Paris scale of 24 feet, where the houses may be only 36 feet high. The fashionable street, the Vicus Tuscus, at Rome, had a pavement of only 13 feet 6 in., the Vicus Jugarius only 16 feet 6 in. If Tyre (according to Strabo) had really taller houses than Rome, it was the consequence of its insular position.

Long and straight streets were to be found in the Campus Martius, such as the Via Lata corresponding to the southern part of the Corso, and that answering to the Via de' Coronari, which leads from the Ponte de Sant' Angelo to the Piazza Colonna ; some also in the other parts, like the Vicus Patricius (Via Urbana) and the Alta Semita (Via del Venti Settembre) ; but the constant rise and fall of hill and valley made them few, especially as the valleys were mostly occupied by the Fora and other public places. Such magnificent vistas, as Antioch and Alexandria could show with their great parades, miles long and in rectangular blocks, Rome never had. In consequence of the lie of the town, the ancient lines have been preserved in mediaeval Rome, down to the days of Sixtus V, and even to the present date. The torn fragments of the plan of the Capitoline city, referable to the beginning of the third century, show an almost equal number of remains of straight, right-angled, and irregular districts, and indicate (no mere chance) the greatest diversity in the breadth in the streets.

Further, the architectural effect of the streets of Rome would be spoiled in modern eyes by some peculiarities of ancient style : frontages, that often swerved from the straight line, windows of irregular shape or isolated in the upper storeys, unequal heights of different parts of the same houses, and the frequency of buildings adjunct or jutting, a cause of the narrowing of the liveliest streets. The ground floors had no spaces opening on to the street, and the street walls never had windows. Where there were arcaded fronts, traffic might pass along them ; but this could only be in the broader streets. In the narrower roads, taverns, booths, shops, workshops and drinking establishments were built into the

street, as even in the business-streets of Pompeii every house has booths with shop tables fixed against the street wall. In the turmoil of the Roman streets the inconvenience of their obstructions by these projections made itself so sensible occasionally, that some relief had to be found. All Rome, says Martial in 92 A.D., had become one big tavern, all the streets were taken possession of by dealers and tradesmen, butchers, publicans and barbers ; the thresholds of the houses vanished. There hung chained upon the publican's stakes, flasks of wine, or in the midst of the thickest traffic the barber might be working ; sooty, smoking cooked-meat shops took up the whole breadth of a street ; and Praetors had to make their way in the muddy carriage-road. Domitian restricted the tavern-room, and streets now widened from mere paths into roads fit for traffic. Yet the wooden projections from the houses remained numerous, as is expressly indicated by Herodian in a description of a street-fight between the mob and the Praetorians in the year 237 or 238 ; any fire originating in them, was by them quickly spread over the whole town. In the year 368 the City Praefect Praetextatus forbade balconies and bow-windows altogether, because of their danger of fires, especially as they had curtains.

But, despite her deficiencies in streets and site, Rome was peerless. Claudian could still aver that Heaven could show nothing fairer ; that no eye could see her immensity, no heart feel all her beauty, no tongue sing all her praise : and, one hundred years later, Fulgentius, the African, cried out, as he saw her : ' How beauteous must the New Jerusalem be, if this earthly Rome be so gorgeous ! ' A panegyrist of Rome (Callinicus of Petra in Arabia) in the third century compares the deprivation of those who have not seen her to that of the blind, who do not know the sun ; he only who knows Rome dare aver he has lived ; his lot is more apart from all others, than that of the consecrate and the polluted. The marvellous thing was the enormous, unresting turmoil of a cosmopolitan population, the confusion and enchantment of a really universal intercourse, the magnificence and number of the public places, and the tremendous size of the city. From what aspect, asks Aristides, could a complete view be had of so many heights covered with buildings, or so many valleys converted into towns, or so much land made into one

city? Wherever one is, is the centre. And, actually, any one looking down from the height of the Capitol, lost count in this whirr of palaces, public buildings and monuments, stretching forth beneath him over hill and dale, endlessly. The ruined desert of to-day towards the Albanian Hills, the home of malaria, was then a healthy plain, all built over with streets that teemed with life. On no side was the town bounded in any sense; no landmark was there to signify where Rome ended and a new realm began. The outskirts continued into the Campagna, and gradually ate up the numerous villages and places of the neighbourhood, and the suburbs were lost in new sites of beautiful country-houses, temples and monuments. The marble peaks, gables and cupolas shone up from the dark green of the parks and gardens.

The public places on the Campus Martius were the most spacious, and as magnificent as any. Strabo has given us a picture of the impressiveness of Augustus' marble city. The broad plain enclosed by the sinuous stream, on its immense surface room for vehicles and riders and gymnasts, its sward ever green, public buildings and monuments all about, rounded off with parks and avenues: all this was a view, an essential of life, the centre, to which the remainder of the town was a mere addition. But, enter the city itself, and see the *Fora* outspread in succession, cased in with temples and colonnades, the Capitol and its erections, the Palatine and the Colonnade of Livia—and what had been seen without might well be forgotten. Such a town, Strabo concludes his description, is Rome. Any losses in the fires under Nero and Titus were replaced or restored, and the original foundations enlarged. The whole of the Campus Martius could be traversed under the cover of colonnades; the entire length of the ten principal porticos of the ninth *Regio* (Circus Flaminius) has been estimated at 4,500 metres, and the area protected from sun and rain at 27,500; the whole comprised about 100,000 square metres, and about 2,000 columns. Pliny says that in every single one of her wonders Rome was sovereign, but her entirety and the collection of them in a single spot created a second world in size. In the latter days of the Republic, the colossal wall of King Servius, fifty feet broad, the huge buildings beneath the Capitol and the system of cloacae had been an object of admiration;

the cloacae had (as Pliny says) seven main subterranean arms meeting at one point, and the strong fall swept all objects down ; its vaults resisted the most enormous pressure from above, collapses and earthquakes. In Pliny's time, the most magnificent buildings were Julius Caesar's Great Circus, the Forum of Augustus, the Basilica of Paulus, restored by him with columns of Phrygian marble, and the Diribitorium of Agrippa in the Campus Martius with a roof of a size up till then unseen, and finally Vespasian's Temple of Peace.

During the fifty years from Vespasian to Hadrian Rome attained her greatest splendour, although the Antonines, and later Severus and Caracalla, did much to beautify her. Caracalla near his Thermae laid the Via Nova, which was pronounced Rome's handsomest street. Yet in the last third of the first, and the first of the second century, edifices followed each hard on the other, works admired by the latest generations, no less than by contemporaries. Ammianus describes the impression Rome made on the Emperor Constantius, who visited it in the year 357 for the first time, and names, in this passage, only buildings of his own day. As the Emperor came to the Forum, the famous centre of the ancient sovereignty, he was dumb with amazement. The Temple of Jupiter on the Tarpeian Rock gleamed as with a present deity. The baths seem as huge as whole provinces. The Flavian Amphitheatre, a mighty building of Tiburtine stone, bulks to heights almost invisible to the eye. That splendid round temple of the Pantheon, with its lofty vaulting, the huge commemorative columns, to the tops of which there are steps that lead from the inside, and surmounted with the statues of former monarchs, the Temple of the Goddess Rome, the Forum of Peace, Pompey's Theatre, the Odeum, the Stadium, all these monuments emulate one another in beauty, glory and magnificence. But when he was led to the Forum of Trajan, and saw this building, probably unparalleled on earth, and admired even by the Gods, he stood still, and let his mind wander through the gigantic space, undescrivable in words, unrealizable again by man.

The considerable remains give us, on the whole, an insight into the plan of imperial Rome. A basilica of huge dimensions, and behind it the hundred foot column commemorative of the Emperor's deeds, formed the background and ideal centre for an open square ; this area was, to one entering from the

Forum of Augustus, bounded on the right and the left by pillared halls, and behind them symmetrical semi-circular buildings mounted up on the one side to the declivity of the Capitol, and on the other to that of the Quirinal, the latter only decorated with an equestrian statue of the Emperor. The Basilica was a market-building on columns; its central room was probably two-storied, surrounded by a double hall, and, in the direction of the Capitol and the Quirinal, bounded off by semi-circular alcoves,¹ had the same breadth (25 metres) as the later basilicas of St. Peter and San Paolo fuori; its wooden ceiling was tiled in bronze, and granite, home and foreign marbles were squandered on it. On both sides (East and West) of the column the buildings of a Greek and Latin library probably stood; behind the column (to the North) a temple to Trajan, built by Hadrian, completed the view. In the course of time Trajan's forum became filled with statues of veteran civil servants, especially in gilded bronze, the pedestals of which (from the time of the Antonines down to the sixth century) have survived. 'Besides this, all the eaves of the surrounding halls and basilicas were covered with golden horses and trophies, statues of barbarians, prisoners or mourners (some of which have survived on the Triumphal Arch), and other works in gold and porphyry; the extant frescoes were in a luxuriant and bold style; thus, a clear picture of the truly royal splendour may be formed, presented by this vigorously symmetrical public square.'

Our first comprehensive descriptions of the city of Rome and her fourteen Regions date back to the middle of the fourth century; two almost identical redactions of an official survey made between 312 and 315 and apparently based on a plan of the city. These documents have two supplements, the first of which catalogues the public monuments under several heads (6 obelisks, 8 bridges, 11 thermae, 19 water channels, etc.), and the second totals up the monuments to be found in the fourteen regions: these are, 2 circuses, 2 amphitheatres, 3 theatres, 4 gladiatorial schools, 5 *ναυμαχίαι*,² 36 marble arches, 37 gates, 290 storehouses and warehouses, 254 public bakehouses, 1,790 palaces, 46,602 lodging-houses, etc. In the Calendar of Polemius Silvius (448 A.D.) seven

¹ *Exedrae*: on their use see Tyrrell and Purser, *Correspondence of Cicero*, II, p. 272.

² 'Mock sea-fights'; hence, places where such were exhibited.

principal 'marvels' of Rome are set out, evidently to counterpoise the seven wonders of the world. The seven marvels (no doubt very variously given) are : the cloacae, the aqueducts, the Flavian Amphitheatre or Colosseum, Domitian's Odeum, the Thermae and the view from the top of the Janiculum (by the Acqua Paola), whence, then as now, the guides made visitors gape at the Seven Hills and Rome outstretched.

But it was not only this incomparable splendour of her architecture that made Rome a city of marvels. The wanderer through her endless realm saw on every hand objects to enthrall his attention. Everywhere was his gaze held fast by the work of the elder and the newer art, which decorated the whole town with a labyrinthine completeness. The walls of the atria and temples glistened with the varied hues of the mural paintings and pictures, and their rooms, as those of the baths, like the streets and the squares, were filled, even as late as the fourth century, with bronzes and marbles. Then there were still 3,785 bronze statues of emperors and generals, which would have brought up the whole number of the public statues to more than 10,000. Add to these the private collections, and some conception may be formed how, two hundred years later, after no few ravages, Cassiodorus could say, that Rome's walls were denizenized with a second population of stone and bronze. And everywhere the buildings were intercepted and defined by green gardens and parks, and at all seasons were these flourishing and fresh. The Esquiline was covered by the gardens of Maecenas, Pallas, Epaphroditus, Torquatus, as though by a huge park : the gardens of the Acillii, of Lucullus and Sallust, occupied the whole surface of Monte Pincio and the neighbouring valleys. And the spacious environs of the palaces enclosed gardens, with splendid ancient trees, wherein birds twittered : especially lotus-trees were favourites in town gardens, on account of the shade they afforded. The six lotus-trees in the garden of Crassus the orator, which in 92 B.C. were valued at as high a price (3,000,000 sesterces) as the palace itself, were destroyed only 150 years later in Nero's conflagration. Even from the roofs and balconies flowers and bushes made the air odorous. Especially on the right shore of the Tiber, and the surrounding hills, gardens partly imperial, were spread out. Many were open to the

public ; further, in the Campus Martius, avenues of laurels and planes, densely shaded, invited pleasant walks ; in the gorgeous Colonnade of Livia (situated on the level between the north-west side of Trajan's Thermae and the church of Santa Lucia in Selci), the foliage of one huge vine, trellised up in the open, provided shadow for passers by. Gordian III had designed below the Monte Pincio on the Campus Martius a large garden with plantations of laurels, myrtles and box-trees, one thousand feet long and five hundred feet wide, intersected lengthwise by a walk, to be paved with mosaics and fenced with rows of cylindrical pedestals surmounted by statuettes. On the two sides lengthwise, columned halls were to finish the design, and along its breadth, on the one side there was to be a Basilica and summer baths, on the other side winter baths. This plan was not, however, executed, and under Constantine the space was filled up with private gardens and buildings.

But perhaps ancient Rome's proudest decoration was the multitude and beauty of her water-works, which were also invaluable for the health of the inhabitants and compensated many disadvantages of site and building. The mountain-springs were conducted into the city in underground pipes or on mighty arches (under Nerva comprising a length of 300 miles), and poured down in waterfalls out of artistic grottoes, or spread out like ponds in broad and richly decorated reservoirs, babbling up in gorgeous fountains, whose cool fragrance freshened and purified the summer air. A consideration of the mass of the water diverted to public use for baths, ponds, canals, palaces, gardens, suburban country-houses, of the distances traversed, of the mason work of the arches, the hills bored through and the levelled valleys, would, says Pliny, convince any man that nothing more wonderful had been made on earth. Galen also reckoned among Rome's principal advantages her many and beautiful springs, the water 'of which in none is evil-smelling, harmful, filthy or hard'. The entirety of the sources provided, after Frontinus almost doubled their yield, never less than 675,000 cubic metres. This water supply was constantly increasing down to the third century, and made recreation in the great public resorts not only enjoyable and healthy, but also induced a ceaseless addition to the numbers of the public baths and

wells, the baths being universally accessible at the low rate of $\frac{1}{3}$ d. a visitor. The Gazetteer of the fourth century says there were 856 baths, eleven *thermae* besides, and of swimming-baths with well-supplies (in Nerva's day 591) 1,352. Many of these swimming-baths were decked with works of art (such as Agrippa's, with a watersnake), and named after them; e.g., the spring of Orpheus, Ganymede, Prometheus etc.; a conical structure flooded with water from above, popularly called 'The sweating pillar'. The ruin of this last bath, and the magnificent ruin of a monumental spring, called the Trofei di Mario, are the sole relics of this 'evidently luxurious splendour'. Further, the second supplement of the Gazetteer speaks of fifteen *Nymphaea*, or well-houses, in which water flowed or rose, no doubt richly ornamented; these the so-called grotto of Egeria may help us to realize, as *Acqua Paola*, *Fontana di Trevi* and *di Termini* may the swimming-baths and their decorations of pictures. The *Septizonium* of Severus (first wholly destroyed by Sixtus V) a three-storied, architectural glory, by the south-west corner of the Palatine, resting on pillars, consisting of three almost semicircular parts, enclosed on both sides by projecting wings, seemed to have been a 'three-fold *Fontana Trevi*'. 'He who, in the hot season, has seen the people rest from their labours at these artificial cascades, and, in the evening, breathe the freshening mountain air among these stone erections which have sucked in and give out anew the midday-glow, may well understand the pride with which people in Nerva's day might boast they had effaced the causes of Rome's former leaden and pernicious atmosphere.' 'The crowning feature, however, of the whole system was the provision of private houses with running water.' After the Water-board in 11 B.C. became imperial, contracting-out of enterprises for the water-supply of private individuals wholly came to an end, and every man could obtain leave, without any regard to the nature of the consumption, of having his house supplied and, in Strabo's lifetime already, 'almost every house in Rome had reservoirs, supply through pipes and abundant fountains'.

Every enjoyment and luxury then known was made accessible through the world-wide commerce of Rome, which filled her markets, shops and warehouses with the most splendid and laborious works of industry and art from among all

peoples. Pliny calls the Tiber 'the gentle buyer of all that is produced on earth'. 'In Rome the merchandise of the whole world could be had all together': Spanish work and Chinese silk, brightly-tinted glass and fine linen from Alexandria, wine and oysters from the isles of Greece, cheese from the Alps and sea-fish from the Black Sea. In warehouses and shops healing herbs from Sicily and Africa lay in stock, and Arabian spices and scents, pearls from the Bahrein islands and emeralds from the Urals, fine-grained boards of costly timber from the Atlas, and blocks of coloured marble quarried in the farthest provinces; the colossal extent of this last importation may be gathered from the discovery of a warehouse of marble on the Aventine. 'To you', says Aristides in his Laudation of Rome, 'there comes from all lands and seas what the seasons bring forth and the climates produce, what rivers and lakes and the handicraft of Hellene or barbarian make. Whoever, therefore, wish to view all this, must either journey through the whole world or stay in this city. For the work and toil of other folks is ever here at hand and in excess. So many merchantmen come here from all lands during the entire summer and winter, that the city seems a general workshop of the entire world. So many freights from India and Arabia Felix are here to be seen, that it would almost appear as though henceforward the trees of those countries are stripped, and those races must come here to Rome to demand what they need of their own products. Costumes from Babylon and jewels from the depths of barbarian Asia arrive here more in number and with greater ease than they would be shipped from an island in the Archipelago to Athens. In short, all that trade and ships may bring reaches Rome, all that agriculture earns and mines bring to the upper light, and all the products of every art, all that is born and grows on earth.'

In fact, everything at Rome conduced to the feeling of being the centre, a world-state whence, as from some lofty tower, the whole earth could be surveyed. From the farthest boundaries, a ceaseless flow of news, 'borne as it were by birds', reaches the seat of universal empire, so that the Emperor who sat there on his throne, could rule the whole by letter. From the principal places the Emperors

received (anyhow at times) continuous reports from day to day ; Caligula used to read those from Alexandria in preference to all others. Whether in Upper Egypt the rain had fallen, or in Little Asia there had been an earthquake, whether the legions on the Rhine were mutinous, or the Parthian Court had changed its tone towards Rome ; soon afterwards such topics were discussed on the Forum and the Campus Martius, at feasts and social parties. Any rare and unheard-of freak of Nature was instantly sent to Rome and there exhibited. Artists came from all countries to show their skill and their prowess, or to vie in the great competitions for the wreath ; poets and orators, philosophers and men of learning, to be openly heard. The most capable and enthusiastic of the youth of all lands flocked from their provincial obscurity to the gleam and splendour of the City of the Universe 'on which the looks of gods and men were turned', which offered ambition its largest scope, and erudition and study, recreation and enjoyment the most glorious opportunities.

In the halls and rooms of numerous libraries (put by the *Gazetteer* at 28) the devotee of knowledge and literature could gloat at his will on costly parchment and papyrus-rolls ; in the circles of the learned, assembled there and in other public resorts such as the Temple of Peace and Trajan's *Thermae*, he might light upon incitement and help of every kind, and a mass of material for his researches, such as would elsewhere be unobtainable : in the lecture theatres he could listen to the discourses of the masters of every craft. Great projects in literature, which could nowhere else be carried out under such favouring circumstances, and in some cases nowhere else at all, doubtlessly attracted men of learning from abroad to long stays at Rome, such as Dionysius of Halicarnassus and Diodorus, even in Augustus' days. Splendid institutions were at the disposal of the humblest in the imperial *thermae* for his recreation and delectation ; and in them, in all seasons, baths of every kind, from swimming-baths to steam-baths, and apartments of more than royal magnificence set aside for his physical exercise, intercourse and pleasure. The older *thermae* (of which those of Nero seem to have been the most luxurious, as they are frequently taken as types of regal splendour) were, in size at least, surpassed by those of Caracalla and Diocletian.

The statement that Nero's *thermae* had 1,600 marble bath-seats, whilst those of Caracalla and Diocletian had almost double that number, emanates from the same official source as our *Gazetteer* and its supplements. Every marvel, however, of this city of marvels, was eclipsed by her spectacles on the stage, in the circus, in the arena ; there what fantasy's wildest stretch might imagine, was actualized into an overwhelming reality.

Yet the greatest of Rome's spectacles was her population, which, as Seneca says in the early years of Claudius, overflowed the houses of the boundless city ; there would the gleanings of the world be trampled down, and the streets had to provide space for a stream of men and women, proceeding to three separate theatres, and men were crushed under foot if any obstacle hindered the rushing cataract of mortality for one instant. The last incident of this sort recorded is perhaps due to a recollection of an earthquake in the year 51, in the course of which the panic flight caused a crush in which the weaker succumbed. The narrow and tortuous streets of *prae-Neronic* Rome would have made such accidents doubly dangerous, yet only two catastrophes on extraordinary occasions are reported. When Caligula was strewing money in front of the *Basilica Iulia*, in the fight thirty-two men, forty-seven women and a eunuch came by their death ; during the night a crowd thronged into the circus and disturbed his slumbers ; he had them cudgelled, and twenty knights, twenty women and an enormous number besides were killed. Further, we have it from an inscription that a woman and a boy of thirteen were caught in a crowd on the Capitol and so died.

This throng in the streets and squares of Rome was very much mixed. The more Rome became the centre of the world, the stronger became its centripetal attraction to all nations. Even Cicero called Rome a community formed of the fusion of the peoples. But the real immigration in mass from the provinces began after the overthrow of the Republic, and in varying force, scarcely diminishing, however, until Constantine, overflowed Rome, and blended her blood with that of every race of the ancient world. Lucan calls Rome a city whose life is alien born, fused with the dregs of all nations ; and Herodian in the third century calls her

population variegated and commingled, and the Emperor Constantius also stared at the sight of the Roman people: 'how swiftly every type of man on earth congregates at Rome'. And, as she went on, she became more and more of a 'common city', the 'hub of the globe', the 'inn of the world'; and one of her Greek adorers, Polemo, the sophist (in the first half of the second century), called her, in a happy phrase, a '*multum in parvo* of the world'.

And this medley derived additional colour from the many strangers that went and came. Roman courtesans received (according to Martial) visits from Parthians, Germans, Cilicians, Cappadocians, Egyptians, Nubians, Jews, Dacians, and Alaní. At especial functions, such as the great spectacles, the number of foreigners reached extraordinary heights. Even at Augustus' spectacle of a naval battle (2 B.C.), Ovid says the whole world was in Rome; at the consecration of the Flavian amphitheatre (according to Martial) spectators foregathered from the farthest regions, Sarmatians and Sigambrians, Arabians, Sabaeans and Aethiopians. But, ordinarily, strangers thronged in Rome, the irresistible lodestar to all men's passions, the 'generous pay-mistress of virtue and vice', and the most promising field for adventurers and scamps of every kind. The righteous man and reliable, says Martial, could find no security there; no hope of making his fortune was there for any one who were not a pimp, or a toper, an informer, who would not seduce his friend's wife, or earn the love-fee of ancient beldames, or sell idle tales near the royal palace, or let himself out to musical geniuses as their *claque*.

In this wise at Rome the gabble of a hundred speeches might be heard, the shapes and garbs of every race rubbed shoulders. Moorish slaves led elephants from out the Emperor's stables. There a troop of blond Germans of the Emperor's Life Guards was exercising in gleaming armour. Here Egyptians, with shaven heads, in sweeping linen robes were carrying the goddess Isis in procession. Behind a Greek professor a young Nubian was carrying his scrolls of books. Oriental princes in tall mitres and broad motley garments with their suite pacing silent, solemn through the crowd; tattooed savages from Britain staring their eyes out at the marvels of the new world all about them.

Sometimes an unusually foreign procession in the streets would arouse general attention ; these would be ambassadors from some far-off barbarian land, its name scarce known, come to offer the Emperor their subjection or voluntary alliance. Such might be legates from the Cimbri and Charydes of Jutland, of the Semnones to the East of the Elbe, from the tribes of the South Russian steppes up to the other side of the Don, ambassadors from Media and Parthia, from the Cherkessan and Georgian chieftains, from headmen in Britain, and princelets of Fezzan, and embassies from India ; one of those last, the tale ran in Rome, had been four years on the way.

The population of Rome can only be approximately estimated. The variations were great ; but, in general (except at times of plagues or civil wars) from Augustus to Trajan it steadily increased, and scarcely declined until the great epidemics under Marcus Aurelius and Commodus. It may be taken at not less than a million, and during the two first centuries, considerably more.

Thus enjoying this luxury of privileges, excitements and sights, it was the highest and the lowest classes in the world-city that prospered the most. The vast majority of the male free population were wholly or partly kept at the expense of the State : the aristocracy had a realm and opportunities for a princely existence never since or elsewhere realized. The seamy sides of Roman life were felt most by the middle class. The prices of all articles of food were very high in comparison with the cheapness in the *municipia* of Italy and the provinces. Above all the housing problem in Rome was more urgent than in modern capitals, because there the possibility of extending the environs of the municipal area was diminished by the lack of sufficient means of communication with the centre by public conveyances ; even carriages inside the city were forbidden to private individuals, except in the evening. A disproportionately large part of the area available for building was monopolized by the few in consequence of the waste of space in the plethoric architecture of the day, and a very considerable portion was swallowed up by the public places, such as the imperial *fora*, which took up six hectares, as well as by the traffic regulations and extensions of the streets. The transformation and decoration

of Rome by the Caesars enhanced the scarcity of housing, as did Napoleon III's improvements at Paris. A further adjutory cause of the increase in price of dwellings was the habit of speculation in house property (which Crassus had practised in great style) and the monopoly of the proprietors, in consequence of which houses, like English lodging-houses in the big towns, were let and then sub-let, and the large middlemen's rents had to be paid by the occupiers. In the Pandects, for example, the lessee's profit is reckoned at more than 30 per cent., and the sublessee's at 20 per cent.; in reality, no doubt, the profit was greater. In Caesar's time lodging-house rents in Rome, on the average, seem to have been four times as heavy as in the other towns of Italy. The lower class families seem at Rome to have paid 2,000 sesterii, in Italy 500 (*c.* £21 15s. and £5 10s.), annually for their homes. Yet in Rome prices under the pressure of events, as stated, and with the growing claims of society, must have risen even higher, even though Juvenal's assertion may be exaggerated, that a house and garden in Sora Fabrateria or Frusino could be bought for no more than the annual rent of a dark room at Rome.

But the prices of other necessities of life were also very high, and such as those of wood and food scarcely to be had by the poor; 'nothing in Rome was for nothing'; and, further, every man who did not belong to the lowest class, of all, was ever forced by circumstance to keep up a needlessly high standard of life. Custom demanded of the less wealthy a certain extravagance of outward appearance, beyond their means, especially of business-men. To eat off earthenware was ungentlemanly; or to go out without one's toga, and, for many, without a retinue of clients and slaves. Pretentious poverty, wasteful starving were the general lot; frauds and bankruptcies the order of the day. Martial says (86 A.D.): 'You see that man there sauntering gracefully along, in a fashionable cloak of violet purple, and with his train of clients and pages and his new sedan-chair. He has just pledged a ring at Cladus the usurer's for eight sesterii to pay for his supper'. Juvenal, some forty years later, remarks that to go bankrupt, for most people, costs them no more than to move from one quarter to another. Shame is unknown. If the money they are squandering before their

creditors' eyes be running out, they are off to Baiae to glut themselves on oysters, and are only sorry they must absent themselves one year from the Circus. The specious glamour of Roman life was in as great contrast with the provincial simplicity and unostentatiousness of the *municipia*, as the sterner moral tone of the towns of Upper Italy was with the corruption and unrestrainedness with which Rome, so far from hushing up her orgies, celebrated them in offensive publicity.

Rome was one continual city of noise and bustle. Horace had complained of the turmoil going on night and day, the scurry and crowding of the streets from whose 'torrents and tempests' he hastened to escape into the chaste solitude of the Sabine hills. But during the first century population and activity increased apace, reaching its zenith, perhaps, in the days of Martial and Juvenal. Before daybreak the bakers would be hawking their loaves, and the shepherds, coming into the town from the surrounding districts, their milk: then the infant schools would begin intoning the alphabet, and with hammer and saw the rasping workshops were set going. Creaking waggons would haul huge blocks of stone and trunks of trees, with the weight of which the ground would quake, heavily laden beasts of burden jostled the foot-passenger; on all sides jolting and knocks and trampling, a fine confusion in which pickpockets reap their advantage. Here, says Martial (100 A.D.), the money-changer clatters Nero's bad coin down on his dirty table, and there a workman is hammering Spanish gold on an anvil. A procession of raving priests of Bellona is shrieking uninterruptedly; a shipwrecked sailor, with a fragment of the wreck wrapped up in his hand, is begging alms; a Jewish lad, sent out by his mother to beg; the call of a bleary-eyed pedlar from the other side of the Tiber, offering sulphur-matches for broken glass. Jugglers, some with trained animals (Juvenal speaks of a monkey riding a goat and swinging a spear), Marsian snake-eaters and snake-charmers are calling for spectators for their craft. Pedlars, peddling old clothes, linen and what-not, carriers of pea-flour and smoking sausages, butchers with a reeking quarter of beef, and the foot, the guts, and the blood-red lung,—each, to his own screeching tune, proclaiming his own wares.

And, of nights, no less noise. In the spacious palaces, their sleeping apartments far removed from the street, sleep and quiet might be had ; so much the worse in the lodgings. The rattling of the travelling-coaches, which might not enter the city for the greater part of the day, awoke the soundest sleeper, as they turned the sharp corners of the narrow streets. And then the roaring of troops of vagabond ruffians, and moonlighters of either sex (and amongst these sometimes women of high rank, such as Julia the daughter of Augustus), or lovers' serenades, striving to obtain admission to their lady by entreaty or force.

And when every door was bolted to, every tavern closed and silent, then the empty unlit streets were both strange and dangerous to the solitary walker. Funeral processions might be met by night bearing the dead of the poor to the pyre.

Although Rome after the year 6 A.D. had a police force of seven cohorts of one thousand men each (which also served as fire-brigade), and patrols with their torches no doubt marched through their districts all night long, yet thefts and burglaries were common. Pliny says that the windows at which people of small means had otherwise put out flowers and leaves, were shuttered off even by day, because of the 'evil robberies of countless multitudes'; probably, after the Civil War, in the year 69 A.D., insecurity was greatly augmented. Juvenal describes house-owners as using their slaves as night-watches; Cassius Dio mentions that they carried bells and so signalled to one another. Robbers used not seldom to make assaults, from which, according to Tibullus, the grace of Venus shielded lovers. Many were threatened with the daggers of a bribed bandit; such thronged to Rome, when their lurking-places in the Pontine marshes and the pine wood south of the Volturnus were occupied by soldiers. And further risks attended the poor man who lighted himself home with his candle-stump, or let a single slave light him on, should he encounter a young nobleman who was returning from some late feast with a great following and many torches. To do mischief at night in the streets was a standing pleasure of the gilded youth. The wretched men who crossed their path were held up, tossed on outspread mantles (a soldiers' joke), or otherwise maltreated. From the roofs tiles would

fall ; from upper windows basins of water be poured down, or broken crockery thrown down, to crash and shatter on the pavement.

More serious still were the dangers to which lodgers were exposed. Most of the lodging-houses were jerry-built by speculators, an attractive but risky game ; it might be very profitable, but for the frequent fires that consumed the capital. The contractors, therefore, no doubt aimed at building in such a style as to make a few years' rental exceed or at least repay the capital expenditure. They exploited the ground, not only by building as many storeys as possible, but also by cutting down the size of single rooms, and reducing repairs to the least possible ; a manner of building, which also, on its part, considerably increased the danger of fire. 'The thin partitions and walls of these piled-up lodging-houses provided no sufficient protection against heat or cold, and were made of wood or panels ; lattice-work was in especial favour ; it looked seductive from the outside, and thus answered the speculator's purpose all the better ; but it materially warped the solid fabric, as the walls would tend very easily to burst or split.' 'Part of our dread', says Seneca, 'arises from our roofs ; even in the pictured rooms of the great palaces, panic ensues, if a crackling be heard'. A great many of the lodging-houses were crumbling ; the most urgent repairs were neglected or scamped ; the agent propped up a tottering wall, or painted a huge rift over, and assured the occupants they could sleep at their ease, all the time that their home was crumbling over their heads. Even in the latter days of the Republic collapses, as well as fires, were the daily fare of Rome. Catullus jeeringly says beggars were fortunate in not having to fear either. Strabo says both of these dangers were ceaselessly imminent ; the dread of them drove nervous folks from Rome in Trajan's time, and later centuries presumably did not alter these conditions. Symmachus, in a letter, adds, as a piece of news, the fact that a collapse in the Via Traiana has cost the occupants their lives.

The fires, in the modern Rome of stone and brick almost an impossibility, were in ancient Rome, not only frequent, but infinitely more dangerous on account of the style of building, the height of the houses, and the narrowness of

the streets, the many wooden fore-houses and rear-buildings which fed the flames, and spread them with terrific rapidity. Throughout the domestic history of Rome, besides the numberless little fires, there is a succession of general conflagrations, and the hills were continually having their levels raised by the old wreckages. In the year 6 A.D., a series of extensive and ruinous fires forced Augustus to institute his Fire Brigade of 7,000 men ; but the reform effected (the means of extinguishing were so very imperfect) was very slight. Under Tiberius two great fires occurred : in the year 27 Mount Caelius was set on fire, in 37 A.D. the Aventine, and the contiguous portion of the Circus ; Tiberius, on both occasions, as far as he could, made good the damage, which in the second instance amounted to 100,000,000 sesterces (£1,087,500). And Caligula, also, in the beginning of his reign, compensated many for the damage wrought by fire. In the conflagration of Nero, ' besides a countless number of lodging-houses, many palaces of the generals of old were lost, with their treasure of foreign booty, and many temples consecrated by the Kings, and in the Gallic and Punic Wars, and many important relics of antiquity '. ' The riches won by so many victories, the masterpieces of the arts of Greece, the ancient and uncorrupted works of great writers '—these were irreparable, however beautiful the resurrected city might be. After this devastation, under Titus, there followed a fire which raged for three days and nights in the Campus Martius. Pliny considered these fires a retribution on luxury, though luxury, nevertheless, continued hoarding its priceless food for the flames. Martial says (90 A.D.), glorifying Domitian's new erections in place of those destroyed in this last fire, that Rome renewed her youth in the flames like the Phoenix, and prays Vulcan henceforth to spare the city, which appertained to Venus as well as to Mars. Under Antoninus Pius a fire ravaged 340 homes. Gellius states how, whilst once (at this same epoch) as a young man accompanying the orator Julianus home with his pupils, they saw a lodging-house of many stories on fire, near the Mons Cispinus, and the destruction soon spread over the whole neighbourhood, at which one man remarked, that, house-rents being so high, he would long since have invested, if some preventive against Rome's continual fires could have been devised. In the year 191 A.D., under Com-

modus, the second most terrible fire (after Nero's) broke out near the Temple of Peace, and annihilated the warehouses of Egyptian and Arabian goods, and then crossed over to the Palatine. All efforts to restrict it were futile; it only sank for mere lack of further nourishment after levelling to the ground a large portion of the city, and devouring numberless treasures; the great libraries on the Palatine were burnt, and a store in the Via Sacra, containing some of Galen's books. The Capitoline plan of the city (about 203-211) shows the new erections of Severus and Caracalla in replacement or restoration of those destroyed. The fire, above-mentioned, which broke out in the street fight of 237 or 238, also laid low a great area of the city. Under Carinus an extensive fire in the Forum forced Diocletian to rebuild it and the houses round it.

Besides fire and the danger of collapse, Nature also, at varying intervals, threatened to overwhelm Rome. Earthquakes, often accompanied with inundations, recurred; as in the years 5, 15, 51, 59 and 68 A.D. The Tiber, too, often overflowed its banks, and nowhere so far inland as at Rome, an experience, too, of modern Rome. 'Both above and below Rome', says Moltke, 'the valley of the Tiber is about 1½ miles broad. Between the Aventine and the southern foot of the Janiculum, where the wall to-day begins to decline, the hills are nearly one thousand paces high. Here there must naturally be a congestion, when after heavy rains in the hills, the Tiber, the Nera, the Velino, the Anio and the Paglia and other tributaries are flowing in torrents'. The Emperors did not neglect anything in the management of the stream and its bed. Augustus set up a department for this purpose, and had it continuously administered by consulars. In the year 15, a futile discussion was held in the Senate on the sources of the rivers and lakes which fed the Tiber. An inscription at Ostia records that, in the year 46 A.D., when the harbour was building there, Claudius had delivered Rome from the danger of floods, by digging channels from the Tiber to the sea. Trajan, also, in the first half of his reign, laid a draining canal, possibly the one still in use; but, in spite of this, in the year 108 or 109, the river overflowed the flat country far and wide, and when the Anio also was flooded, the devastation spread further still. And so in spring or autumn

the waters of the Tiber, despite all efforts and precautions, inundated the low-lying parts of Rome, and reached higher levels, thrust backwards as they were by storms, and swollen by rain, until they destroyed the old wooden bridge, and carried away in their impetuous surges men and animals. For days whole districts were knee-deep in water; only the higher storeys emerged, and were accessible by boats, which carried food to the secluded occupants. And when the stream sank anew into his wonted channel, the undermined houses collapsed, and plagues and famine followed: famine, because the inundations had rotted the full stores of corn at the wharves (as Plutarch expressly says happened in the year 69). And Gregory of Tours also tells of a flooding of Rome in which incidentally the stocked corn belonging to the Church was destroyed.

Ancient Rome suffered more from the disadvantages of a riverine position than modern Rome, as the low levels have since been raised by the accretions (in the Campus Martius by two metres, and the Forum by six to twelve), whilst the height of the river has not risen in the same proportion. This circumstance naturally contributed no little to the frequency of inundations in antiquity. Historians have doubtless only recorded the severest of them, and these imperfectly, as five under Augustus (27, 23, 22, 13 B.C., and 5 A.D.). In 27 B.C. access to the new theatre of Cornelius Balbus could only be had in boats; in 5 A.D. for seven or eight days traffic was by water, and the number of deaths and collapses something considerable. Under Tiberius there are two floods mentioned, 15 and 36 A.D. One of the greatest was in March 69, when the waters were forced back by the mass of the ruins and covered loftier places, generally secure even when the floods were highest, and swept away many in the streets, and overtook others in booths and bedrooms. Otho, whose march was delayed by this irruption, found the road at a distance of twenty Roman miles (18½ English miles) encumbered with fallen buildings. From Nerva to Marcus Aurelius, too, no reign went by unmarked by at least one great inundation.

Nor was the river the only cause of famine at Rome. The utmost forethought on the part of the Emperors could not allay deficient supply and consequent appreciation in prices,

for the over-populated city was entirely dependent on imported grain. And then disturbances arose. One reason that private commerce could not absolve this need, was that the contributions in kind, which were imposed on the corn-lands, left but little over for export. Egypt paid her double-tithe, in the form of a four months' supply of the needs of Rome ; the province of Africa (under Vespasian) for the remaining eight months. Further, private commerce could not compete with the fisc, which sometimes used to sell below cost price the corn it received partly as tribute, and partly as purchase by its agents : consequently private corn-market speculations, however much encouraged by the Emperors by the granting of honours and privileges, failed of practical effect. The Emperors made most liberal provision for a sufficiency of corn. A special service of vessels for Egyptian corn was instituted in the Early Empire, and under Commodus, one for African corn. Claudius extended Ostia, Rome's principal harbour, at enormous expense, as it had been impossible to land there in the winter, and appointed there a cohort of the Roman fire-brigade to protect the warehouses. Trajan added another harbour, and Portus, this new town, flourished and rivalled Ostia, on account of its better position. The magazines at Rome were ever growing larger in the course of time, and Tiberius, in a message to the Senate in the year 32 A.D., reminds the Senate of the great excess in the importation of corn as against that in the time of Augustus, and specifies the contributing provinces. Under Trajan the stock was so great that, when the Egyptian harvests failed, Rome exported to Egypt. And under Marcus Aurelius, corn was distributed by Rome amongst the Italian cities. Severus left a seven years' supply at his death. But still during the first two centuries, were the government good or bad, appreciations in price recurred again and again, partly because the stocked supplies rotted, or were destroyed by fire or water (in the year 62 Nero threw the mouldy grain into the Tiber, in order to satisfy the populace as to the sufficiency of the supply : yet the price did not go up, though 200 grain-ships were sunk by storms at the harbour's mouth, and 100 burnt in the river) ; partly, also, because of embezzlements or frauds on the part of the employers. An instance of such malversations is afforded by Dio ; in the year 189 prices, already high,

were raised by the Praefect of Corn, Papirius Dionysius, in order to render the Imperial Chamberlain, Cleander, whose defalcations had been the principal cause, even more hated of the people. During the years 5-8 a famine occurred, partly through the flooding of the Tiber, partly through bad harvests, and the price of grain went up to five or six times the ordinary sum: an adult's monthly ration (5 modii or $43\frac{1}{2}$ litres), ordinarily selling at 5 denarii, was sold at $27\frac{1}{2}$ denarii, an unprecedented event. All slave-families and bands of gladiators, all strangers except physicians and teachers, even some slaves privately owned, were expelled from the city; Augustus and others dismissed most of their domestics. Yet only through extraordinary exertions was a rising averted. In the year 19 prices again went up. Tiberius, yielding to popular clamour, fixed a maximum price for corn, and paid the corndealers two sesterces more per modius. In the year 32, again, high prices almost caused disturbances. The Emperor was away at Capri and the mob vented its complaints in unusually riotous fashion. The diversion of many transports to the building of Caligula's bridge from Baiae to Puteoli (39 A.D.) injured shipping to the extent of again raising prices in 41 A.D.; and Claudius was thereby forced to extend the harbour at Ostia. Bad harvests had the same consequence once more in his reign, in the year 52. Only fifteen days' provision was in hand; a tumult broke out, and Claudius himself scarcely escaped the rage of the populace. Fortunately the winter was mild, and the incitement given to shipping and the corn-trade by the Emperor's large subsidies had a favourable effect. In the year 68 just before Nero's death there was famine, and the ill-will of the people was increased by the news of the arrival of a ship from Alexandria with Nile-sand destined for the Emperor's wrestling-school. In the year 69 there was a terrible flood and famine, furthered by lack of industry and general insecurity as already described. From between Hadrian to Commodus (under Hadrian the famine apparently spread over the whole or the greater part of the Empire) Rome was visited at least once by scarcity and dearness of food. And, as time went on, matters did not amend. Ammianus, for example, never omits, when speaking of Rome, to note the success of the Praefects in the corn administration, or

their failure ; mostly the latter. On such occasions, even in the Early Empire (as under Augustus), it became customary to expel foreigners *en masse*, and a favourite resource, so as to lessen the numbers of mouths to feed.

And the seeds of ravaging epidemics were of old fostered in this soil. The unhealthiness of the situation of Rome is well known. The network of canals in the limestone hills, lessening the moistness of the soil and therewith malaria in a great degree, seems in antiquity to have benefited the Campagna more than the city, where the isolation of the fever germs scattered in the soil by the pavements and foundations of houses of any sort can only have been imperfect. There, says Ammianus Marcellinus, as though to signalize the world's capital, disease wreaks greater harm, and all the leechcraft possible falters at the task of relief. Fever had been adored as a goddess very early, the fever ever endemic to Rome ; according to Galen, it was the two and a half days' attack which was most prevalent. And, where the inhabitants were so closely packed together, infection must have been easy and limitless. Medicine found plenty to study. One form of distortion of the shoulder Hippocrates observed four times at Rome, and nowhere else ; true, one street in Rome was more populous than many of the cities Hippocrates had visited. The inhabitants of the town were uniformly pale. Martial, writing to one Domitius, says that after his journey in Upper Italy, his pale-faced friends will scarcely recognize him, and will envy him his rosy cheeks ; but, however sunburnt he return, Rome will soon whitewash his fresh tourist's complexion. A heavy atmosphere hung over the city, from the smells of the many smoking kitchens, the vapours of which were blent with clouds of dust ; the first step outside the city seemed a positive relief. Frontinus' reforms of the drainage and water-supply may have allayed the mischief of the bad air ; it was impossible to get rid of it.

Both in republican and imperial Rome great epidemics followed one another, often at terribly short intervals, and claimed innumerable victims. Under Augustus throughout Rome and Italy desolating plagues prevailed in the years 23 and 22 B. C. At the great plague in the autumn of 65 A. D., neither sex, nor rank, nor age were spared ; the houses teemed with

dead, and the streets with hearses. Thirty thousand burials are recorded in this single autumn in the books of the Temple of Libitina, the goddess of death, where the undertakers had their meeting-place and storehouse; yet this can only be a fraction of the whole. For, not only was the provision at this temple insufficient for great epidemics, but slaves and the poverty-stricken would scarcely have been buried there, at any rate when the mortality-rate was so high. And, on the eruption of Vesuvius (79 A.D.) a devastating disease broke out at Rome 'greater than any had been'. On many days some ten thousand deaths were registered on the daily lists (*ephemerides*)—out of which, later at least, statistics of the ages of the deceased were drawn up. This number is not incredible, as in Palermo (which then had 168,000 inhabitants) from July 3 to July 13, 1837, more than one thousand died daily, and on the 10th, 1,803.

But the most frightful of these epidemics was that which broke out in Babylonia, and in 162 A.D. was already ravaging Ionia. It was brought back from the East to the West in the train of the army of Lucius Verus; it raged longer than any other, and spread the farthest, not only in Rome, but throughout the ancient world, through a very large portion of the Roman Empire up to Gaul and the Rhine. It unpeopled the camps of the legionaries, and stripped the whole of Italy of her population to such an extent that villages, cities and fields became masses of ruins or wooded deserts after their cultivators and inmates had perished. In the year 167 or 168 the plague reached Rome, and seized upon many thousands, no few from the highest ranks. The corpses were carted out of the city in heaps: Marcus Aurelius had the dead of the poor buried at the public expense. Galen says the plague was very similar to that described by Thucydides; in both the bodies of the diseased were covered with black pustules; they had a severe cough, were hoarse and their breath stank. The plague (Petechial typhus or small-pox?) continued for many years, now more, now less virulent; at the death of Marcus Aurelius (180 A.D.)—who himself perhaps died of it; on his deathbed his thoughts were preoccupied with its ravages—it was still active, and the disease which raged at Rome under Commodus (about 187–189) may well have been its dying spasm. According to Dio, 2,000 men

and women died of it at Rome on one day. And then even the rumour that springs up so easily when a plague is laying mankind low, was industriously circulated, that men had been instigated to spread it by means of poisoned needles.

These many evils, various and horrible, served ever anew to remind even 'Rome golden, holy, eternal' of Varro's truth, 'God made the country and man made the town.'

CHAPTER II

THE COURT

I. ITS INFLUENCE ON FORMS AND MANNERS

JUST as the imperial dignity at Rome arose from out of the private orders, so too the imperial court fashioned itself at the outset, in establishment and forms, as also in its membership, after the noble households. At first there was little to distinguish it from the great Roman families; later it gradually approximated to the type of ancient royalties. The repeated efforts of several emperors, sometimes genuine, to restore it to its former civic simplicity only delayed the process of evolution, which was consummated in the third century, largely under the influence of the East, then become irresistible.

But, on the other hand, the Court reacted in many ways, first on the manners and formalities of the upper ranks, and even on their domestic arrangements, and then increased the range of influence. Next the opinions and principles of the monarch, when decisively expressed, his tastes and amours, or those of his family or favourites, set the tone for Rome as is only possible in an unlimited despotism. And not for Rome only. There was a certain truth in the well-known proverb that the world apes its ruler. With individual emperors, institutions, customs and ceremonies also changed. Only such a philosophic view as that of Marcus Aurelius could see an eternal similarity through this kaleidoscope of incongruous epochs. For, to his eye, all had already been, and to-morrow might again be, the Court of Hadrian and Antoninus, Philip, Alexander, Croesus; the stage was all the same, only the actors shifted. Ever and anon the same frantic, the same transitory aims, under a Vespasian or a

Trajan—the same spring-time of exertion, the same autumn of failure ; time and oblivion swallowed all, and would soon swallow up the present. Yet he who would not steadfastly look away from the phenomena of life and reality, ever learned anew, how swift and sweeping were the changes, or rather revolutions, induced by each change in the highest circle. Often enough was this uttered by contemporaries. ‘ We are like putty ’, said Pliny the Younger in the Senate in Trajan’s presence, ‘ moulded to every shape at the Emperor’s will, and following his every lead : our ambition is to endear ourselves to him, and win his approval, a prize denied to those dissimilar from him ; our continuous pliability has brought the whole world to the pass of living the manners of one man. The Emperor’s life is a censorship, of life-long duration ; in his wake we guide our steps, and after him we walk ; only an example, no command even, is requisite’. And Herodian says ‘ that the subjects hasten to adapt their life to the monarch’s’.

Such transformations were most striking when a stern and severe Court followed on one or more extravagant reigns. Thus banquets, which were at their height of luxury in the period from the battle of Actium to Nero’s death, became more moderate later ; a result, as also the greater purity of morals, attributed by Tacitus to Vespasian’s old-world simplicity of life. Subservience to the Emperor and the desire of emulating him was more potent than the fear of law or punishment. No less sharp is the contrast between the courts of Commodus and Pertinax ; no less prompt its effect ; the general imitation of Pertinax’ economies, says his biographer, produced a general cheapening of prices in Rome. And Alexander Severus’ reign was also, because of his manner of life, a censorship : the grandees of Rome imitated him, the nobles’ ladies his wife.

A similar spirit of emulation was provoked by the Emperor’s intellectual tendencies and interests. Nero, twice before his accession, and in the first year of his reign, gave exhibitions of oratory : a tremendous enthusiasm for rhetoric followed, and Rome teemed with teachers of the art, which had never before flourished to such an extent ; and many, through their skill, raised themselves to senatorial rank and the highest honours from the lowliest beginnings. And it may confidently

be assumed, though nowhere recorded, that Nero's passion for music had a like effect: musical rulers, says Plutarch, produce many musicians, just as emperors, who favour literature or gymnastics, add to the number of authors and athletes. And, under Marcus Aurelius, the enthroned philosopher, lovers of wisdom and science increased and multiplied, especially that specious kind, which under this mask hoped to win position and riches. Lucian loves portraying—almost to the point of becoming tedious—the manners of these mock-philosophers, swarms of whom then pervaded Greece: there, as he tells us, in every street and square, shaggy beards, scrolls, big 'staves and shabby cloaks were to be seen in throngs. Rude and uneducated men bought libraries in the hope of attracting the Emperor's attention and gaining great advantages. One such man is the butt of a special satire of Lucian's. His descriptions can hardly be exaggerated; and a fact narrated by Galen speaks even more eloquently than all else for the influence of the imperial example, and cannot be suspect in any wise. Marcus Aurelius used to take a dose of theriac daily, an antidote esteemed as a panacea as well. During his reign, this drug was manufactured for the rich in so huge quantities that the ingredients in it almost vanished; for, says Galen, it is wonderful how the rich ape every doing of the Emperor, or anyhow wish to appear so to do. After Marcus Aurelius' death, the demand for theriac at Rome instantly ceased. Naturally, too, the Emperor's favourite dishes found a ready sale, such as, under Tiberius, an edible root, imported by him every year from Germany, and African grapes preserved in smoke, which he preferred to those from Velletri, formerly in vogue; and mullet became popular, because Julia, his mother, ate it. Nero 'made garlic respectable', as he took it on certain days of the month with oil, and no other dish, to improve his voice. Probably, too, Marcus Aurelius' short hair, and Lucius Verus' long hair, determined the custom, not only at their courts (as Galen testifies), but also in wider circles; just as the short hair of Charles V (a preventive of headache), and, later on, the curls of Don Juan of Austria, which fell behind his ears and temples, created in their day the prevalent fashion.

Thus the conditions in the higher sections of society more

or less faithfully mirrored the manners of the Court of the day; though such shifting phases are all the more superficial.

II. THE OFFICIALS, FREEDMEN AND SLAVES OF THE IMPERIAL HOUSE

§ 1

The Court, more narrowly defined, consisted of the domestics and officials attached to the Emperor and his family, who were already very comprehensive and carefully gradated. In a wider sense, it included the so-called friends of the Emperor.

For the greater part of the first century, the Emperors, like private individuals, used their slaves and freedmen as assistants and representatives in the administration of their revenues and institutions, and generally in the conduct of business, as well as for personal service. Though the object was to preserve to the imperial court the character of a citizen's house, yet here and there an opposite motive entered in, not incompatible with this would-be ordinary life. Very soon these officials of the imperial house, however lowly their origin, however subordinate and despised in their proper rank, attained an actual power, raising them above the noblest born. The nature of Caesarism, in evolution even, exacted a certain deliberate system of disregard and levelling of distinctions of rank, not only in order to break the resistance of the aristocracy, but also to make manifest that the imperial will was all-powerful, alone sufficient to raise the meekest; to show that from that height all subjects were equal. In unambiguous language Tacitus remarks, that amongst the Germans freedmen are seldom influential in the home, and never in the State, except amongst peoples governed by kings: but there they surmount the free and the noble; whereas, elsewhere, their subordination is the proof of freedom. This ruthless contumacy of the new royalty in face of tradition and law, even the first Caesar exhibited. He made slaves supervisors of the mint, handed into their hands the receipt of public tribute, and appointed the son of a freedman, Rufinus, his former page, to the commandership of the legion he left in Alexandria.

Yet, as the development of the imperial system advanced

R.L.M.

D

and forms and institutions were shaping themselves to absolute monarchy, the House and Court offices, partially at least, began to be invested with the sway and importance of State offices, only open to those born free and noble. The preservation of the feint of private life was henceforth impossible and undesirable; the service of autocracy by the raising of the humble no longer necessary. And so the imperial freedmen were thrust forth from some of the principal Court posts, and the knights replaced them. Freedmen were only employed in public business in subordinate positions, and restricted to personal service. After this alteration they were still sometimes very powerful, but in another capacity. In the first century the nature of their power consisted partly in the importance of their office; in the second and third in their personal influence at Court, real or imaginary. The freedmen who ruled in Claudius' name were the principals of the Imperial Finance Committee, of the Secretariate and the Petition and Grievance Department; at Commodus' Court, the all-powerful freedmen were the chamberlains.

The growing consequence and importance of the Court service and House-offices provides, therefore, an infallible index for the advance of the autocracy, which started out with the outward forms of the Republic, and concluded in a stereotyped and Oriental absolutism. The State departments, in the first century bearing the external shape of inconspicuous House-services, although their holders ever since Claudius had been the most mighty State officials, were already in the second century distant ambitions for the bureaucracy of the knights, only attained after long administration of important posts, and stages on the way to the highest places accessible to them.

Up to the reign of Vitellius freedmen were the absolute possessors of the Court-offices, and, in this capacity, after Caligula, the holders to an extent of supreme authority. Vitellius was the first to grant these positions to the knights. Yet the nominations wavered for some time, partly because the decisive fact was the Emperor's whim, and his predilection for submissive and obedient servants rather than men of rank, and also because from amongst the freedmen there rose to light especially capable and tested individuals. Under Domitian two of the three important offices above were

occupied by freedmen—the Secretariate and the Department for Petitions and Grievances. But in his reign and those of Nerva and Trajan, a knight was set over the Secretariate; under Trajan, a freedman as well.

Hadrian was the first to draw a hard and fast line between the administration of the empire and of the Royal house, formally withdrawing from the latter its private character, and replacing the freedmen by an imperial bureaucracy with magisterial powers; the establishment of this order was the sole hope of dealing with the vast problems that had grown up. In all of the upper administrative posts knights replaced freedmen, especially in the three chief departments, which were formally converted into departments of State. Henceforth the holders of them climb up, mediately or immediately, to the highest positions in the universal empire, such as the vice-royalty of Egypt and the praefecture of the Praetorium at Rome. The same proposition holds true of the Imperial Finance Department; subject to the anomaly of this post, even when it was so lofty a step on the rungs of the imperial service, being held by freedmen. But, apart from such anomalies being incidental to the essence of absolutism, considerations of business ability and trustworthiness outweighed others in the selections of these officials, and the possibility of promptly coercing any signs of disloyalty was of especial importance. It is this point that Maecenas emphasizes (according to Dio) in his address to Augustus, as a reason why it was so advisable to appoint freedmen in financial administration.

After freedmen had been wholly or almost wholly deprived of these posts, the office of Lord High Chamberlain (*a cubiculo, cubicularius*) was their means of gaining authority. The evolution of this office characterizes the later Empire, just as the growth of the other departments that of the Early Empire. Influential as the chamberlains had been at all times, their outward dignity was at first very low. It was the permeation of Eastern customs that first lent a high rank to the Prefect of the Holy Chamber (*praepositus sacri cubiculi*, his new title). In the last century eunuchs usually held the post, a significant symptom of the perfect easternizing of the Roman Court. Men like Eusebius and Eutropius did not merely enjoy a more undisputed sway in Byzantium

and Ravenna than Pallas or Narcissus at Rome ; lawfully they ranked with the highest officers of State.

But before considering these offices more narrowly, the position occupied by the imperial freedmen, as such, apart from the service, must be examined, and the sequence of alterations followed, which they constantly underwent during the first two centuries.

Throughout this period the East, as the countries of ancient civilizations, Greece, Little Asia, Syria and Egypt, almost entirely supplied and completed the domestic service of the Emperor, as well as of the great Roman palaces. The North and West provided most of the Emperor's personal life-guards ; Greece and the East was their favourite hunting-ground for their service, personal and financial ; and thus these peoples, the scum of mankind in the view of the proud Roman, attained the highest positions. The Orientals were, as one of them (Herodian) remarks, shrewder and more astute.

How the Romans despised the Greeks is well known. Caesar calls them deceitful, shifty, and rendered servile to the point of adulation. Their unveracity met harshest blame, and, no doubt, made men unjust to their lively artistic imagination. Further, their representatives at Rome were often unworthy of ancient Greece. Juvenal, in a well-known passage, characterizes them as quick-witted, over-eloquent, everywhere at home, willing at demand to come forward as professors, artistes, drilling-masters, soothsayers, rope-dancers, physicians or conjurers, past masters in the arts of flattery and hypocrisy, born actors, astoundingly impudent, and in their choice of means unscrupulous, and shameless. In this sketch of a loathing pen, the excellencies, which still adorned the sunken nation, are forgotten, such as their instinctive nicety (for which Philostratus praises the Ionians especially), their higher and fuller civilization, their charm, inventiveness and business ability, which had made them as indispensable at the Courts of Persepolis and Susa as then at Rome.

The Syrians were deemed clever, dowered with tastes and gifts for drollery and satire, unstable and ready, but also crafty and faithless. The Egyptian appeared to the Greeks and Romans a curious mixture of contradictory qualities,

mostly unpleasant and sly ; 'aegyptizing' to the Greeks meant underhand dealing. The Alexandrians were especially noted for their intellect and perspicacity ; their wit was said to be instant and bitter, full of obscenity and gibes ; their speeches were considered unmatched for impertinence and shamelessness. The Egyptians in general were stigmatized as vain, conceited, insolent and boastful, fitted alike for deeds heroic, or slavish thralldom. They were luxurious and lustful, but endured the rack with wonderful steadfastness. Hot-tempered and tetchy, eager to pick quarrels, ever greedy for novelty (as their carmagnoles showed) and therefore tumultuous and revolutionary. They were also envious, reticent, sly and obstinate, as was made apparent in their religious fanaticism. Tacitus calls Egypt a province torn asunder and unsteady on account of its superstitiousness and lack of restraint. And the fellahs of to-day exhibit surprising similarities with the descriptions of the ancients, namely, craftiness and wiles, endurance and stiff-neckedness, conceit and quarrelsomeness, envy and mendacity, and love of satire and gibe.

The fates of these imperial servants, often their masters' rulers, were sometimes the most singular of the strange events of this eventful time. Often their introduction to Rome had been on the platform where cheap slaves stood with whitened feet, and were inspected and handled by purchasers. They passed from hand to hand, suffered every degradation of slavery, before entering the monarch's home by sale, gift or inheritance, or being as freedmen transferred into it. Talent, adaptability or fortune turned their master's eye on them, and raised them from that bottomless sea of servitude, some promptly and suddenly, some slowly and gradually. Many of them have made inroads on the world's stage, and cut their names deeply on the tablets of history. Of others again we learn from monuments : they rose from humility to heights of service, their careers, if less brilliant, were more secure, more honourable and distinguished. To follow their story is not uninteresting. Like instances of such attainments of splendour and might from the lowliest origins, are afforded perhaps only by eighteenth-century Russia. The consort of the Empress Elizabeth, Count Razúmovski, had, in his boyhood, herded cattle ; Menshikóv, Peter the Great's

confident, had sold tarts in the street. Kutaisov, one of Paul's favourites, was a Turkish orphan, captured by the soldiers at the siege of Bender, brought from the camp to the court, to do scullion's work ; he rose to be boot-black, then the chamberlain and barber of the grand duke, and ended by becoming equerry, count, a knight of all the Russian orders, and an opulent magnate, and ever contrived to remain in the Emperor's graces ; and yet the master whom he still shaved, used to whip him at will to the last.

The position of the freedmen, in so far as it was dependent on the relation to the Emperor, the respect and power they enjoyed as the servants of his house, outside his service, naturally varied with the monarch's personal tastes and principles of government. Limited though their extra-official influence may have been under good governments, yet it was by no means slight, as the following survey will show, under the best ; it must not be forgotten, moreover, that our knowledge is derived from isolated facts, only from such as aroused general attention.

Augustus, who officiously deported himself as a private individual, was uncompromisingly severe towards his slaves and freedmen in Rome, if they allowed themselves, in view of their position in his house, any liberties. They had greater licence in the provinces. Licinus, the Gaul, one of Caesar's former slaves, ruled in his own country as imperial commissary for some time with absolute sway, and extorted enormous sums. He is notorious for dividing the year into fourteen months as regarded monthly payments, as November and December were the ninth and tenth (as their name shows) and two new ones (called Augustean) had to be added. Despite the petitions of the Gauls, and Augustus' ill-will, he escaped with the sacrifice of a large sum, and had so much over that his wealth was spoken of in the same breath as that of Crassus and Pallas. His towering marble tomb on the Via Salaria, a monument builded for eternity, was a landmark for bitter reflections for later generations. And it is noteworthy that Herod, King of the Jews, who left Augustus 1,000 talents in his will, directed 500 to be given as legacies to the wife, children, friends and freedmen of Augustus.

Tiberius was of a nature too aristocratic, knowingly and publicly, to allow freedmen any influence on his wishes. ' His

slaves were modest, his family contained few freedmen,' is Tacitus' comment on the first half of his reign. Later, after the death of Drusus, this and much else changed. Egypt, the most important imperial province, was, after Sejanus' death, entrusted to a freedman, though only temporarily. Herod Agrippa, the King of the Jews, almost ruined himself with his presents to Tiberius' freedmen, whose support he thus purchased; one of them Thallus, a Samaritan, was in a position to lend him 1,000,000 denarii; and yet the greatest of them was another freedman, Euhodus. Nomius, a third freedman of Tiberius, Pliny cites as the owner of one of the largest and most valuable tables known, made of pure citron-wood, whilst Tiberius only had an inlaid one.

But the frightful anomaly of publicly putting at the helm of the world-state a half-lawful and despised class, and letting them decide the most momentous issues, only really began under Caligula. Callistus, a private individual's slave, was sold, became a slave of the Emperor, and, as his favourite, gained practically an equal autocracy and enormous wealth. Seneca often saw his former master vainly beg admission at Callistus' door. At his request, in the year 39, Caligula consented to abandon the persecution of Domitius Afer, consul in 39, an orator he disliked. Though a participant in the conspiracy against Caligula, Callistus kept his position under the succeeding emperor.

The *saturnalia* of the freedmen were celebrated in the reign of Claudius. In Seneca's pasquil on the deification of Claudius, at his entry in Elysium, all those present, he says, must have been his freedmen, as no one regarded him in the least. Callistus, Pallas and Narcissus, 'brave and crafty men', made the Emperor's home the seat of Empire, and themselves the participants. They, and the other freedmen, with Messalina as their accomplice, juggled at their fancy with civic rights, offices, governorships, reprieves and even capital sentences. Besides these names Suetonius mentions Botes as the lover of Claudius' first wife Urgulanilla, and father of their daughter Claudia; also Posides the eunuch, the Procurator of Judaea Felix, Polybius, the literary adviser, and Harpocras. Both of the last and Myron, Amphaeus and Pheronactus, in Seneca's pasquil, receive their former lord, in the underworld; he had sent them in

advance, so as never to lack for servants. Pliny names a very rich eunuch Thessalicus, originally a freedman of Marcellus Aeserninus, who, however, to gratify his ambition got himself adopted by the household of Claudius : he was the first to transplant the ever-green plane-tree from Crete to Rome and his villas there.

Nero's freedmen possessed no less power. Polycletus, one of the most infamous pilferers at his Court, was in the year 61 despatched to Britain to arbitrate between the Legate and the procurator of that province, and also to quench the smouldering embers of revolt. With a tremendous retinue he repaired to Britain, the terror of the armies and laughing-stock of the barbarians, who failed to understand the power of a freedman, could not grasp how a host of men and a victorious leader could cringe to a slave. Another freedman of Claudius, Helius, was, at the beginning of Nero's reign, administrator of the imperial demesnes in the province of Asia, and in the year 54 was employed by Agrippina to assassinate Junius Silanus, pro-consul of that province. Nero, for the period of his journey to Greece (66/67) left him at Rome in absolute sway ; he could issue edicts of confiscation, death and exile against knights and senators even, without any reference to Nero ; so that Rome, in Dio's words, was subject to two Emperors ; which were the worse, none could say. In the year 62 a detachment of men, under the command of a centurion, was sent to murder Rubellius Plautus, and the direction of it was entrusted to Pelago, a eunuch, with a train of halberdiers like the slave of a sultan. Of the two heads of the department of Petitions and Grievances Doryphorus (a boon-companion of Nero's debaucheries, whom he afterwards poisoned) and Epaphroditus, Epictetus the philosopher's master (who was instrumental in Nero's suicide), we shall speak later on.

Galba had those favourites of Nero, for whose punishment popular hatred clamoured the most, executed ; namely, Polycletus, Helius and Patrobius (who in the year 66 had conducted the gorgeous games and spectacles in welcome of Tiridates, the King of Parthia, at Puteoli). Yet Halotus, one of the most fiendish of them (perhaps the eunuch who acted as cup-bearer when Claudius was poisoned), Galba not only let go scot free, but also appointed to a very high procuratorship. He was contemptibly submissive to his own freedmen ; as

before, the Court became a chaffering-place for taxation or exemption, the punishment of the guiltless or the acquittal of the guilty in return for pelf or favour. The most influential of them was one Icelus, a man of the dirtiest antecedents, whose only virtue lay in subservience to his lord. The right of wearing a gold ring was given him, and thus knightly rank; he was spoken of as a candidate for the Praefecture of the Praetorium. He, too, abused his power for the most reckless pilfering. Otho had him executed, and restored Nero's freedmen and procurators, a source of general consternation. To his own freedman Moschus he handed the command of the fleet in the Civil War, and the commission of keeping a watchful eye on the demeanour of the upper classes.

From depths as low as Icelus, Vitellius' freedman Asiaticus climbed up to a position of equal might in his reign. He had been maltreated by his lord, ran away in disgust, and maintained himself at Puteoli by selling a liquor relished by the vilest of the lower classes; he was caught, again won his master's graces, again embittered him; his master's anger made him sell the slave to a peddling merchant of gladiators; then he bought him back and at last set him free. On the first day of Vitellius' accession, he was raised to knightly rank; in four months he had fared like the most depraved freedmen of the preceding reigns. His career terminates with that of his master, he being probably crucified. Of the freedmen of the first two Flavian emperors little is known. According to Philostratus Apollonius of Tyana advised Vespasian to curb the freedmen's spirit; the greater their lord, the less should they be. According to Suetonius it was believed that Vespasian promoted the most rapacious to procuratorships, so as to sentence them afterwards, and confiscate their augmented properties. One of his freedmen, Hormus, a man of ill-fame, who had proved himself active in the Civil War, and responsible for the razing of Cremona in 71, was made a knight. Under Domitian freedmen again were given important offices and great power; the chamberlains Parthenius and Sigerus were personages of great weight at his Court.

A substantial change in the position of the imperial freedmen came in with Nerva and Trajan. Yet the tone in which

Pliny the Younger praises the newer modes of government shows that they retained no little authority. 'Most of the princes', he says, 'were both lords over citizens and slaves of freedmen, who became the guiders and controllers of their counsels, their ears, and their tongues; the purveyors or rather granters of Praetorships, priesthoods and consulates. To your freedmen you may well give honour, but as freedmen; you may believe that for them to be upright and honest is merit enough. For, as you know, great freedmen and little princes go together. And, above all, if you only have about you such as are dear to you or your father and all good men, you can fend them off, bid them betake themselves to their own rank, not yours: and they rank all the higher in that we do them every honour, unsolicited'. And Pliny also tells how at the indictment of Eurythmus, a freedman and procurator of Trajan, for forgery of a will, the parties dreaded appearing in the case; and Trajan finely observed: 'He is no Polycletus, nor am I a Nero'. Hadrian is said not to have stickled at wooing and bribing Trajan's freedmen, so as to secure his own adoption. He himself aimed at his freedmen remaining unknown, and their wishes having no weight with him; he used to say that all previous emperors had had to bear the burden of their freedmen's vices, and was severe against those who made boast of their influence over him. Antoninus Pius, too, repressed his freedmen, and effectually destroyed the power of the courtiers by personally keeping himself well informed, and preventing them from selling their information. But Marcus Aurelius was too gentle to be able to shatter the dominance of Geminus and Agaclytus, two freedmen high in his co-regent's favour: he even suffered Verus to marry the latter to the widow of his cousin Annius Libo (Consul in 128, died as governor of Syria in 176), and deigned to be present at this wedding, so repugnant to his principles. After Verus' death he dismissed his freedmen on honourable pretexts, except Eclectus, who afterwards murdered his son. Under Commodus the freedmen ruled as arbitrarily as ever under Claudius; and one of them, Cleander, actually was Praefect of the Praetorium, the highest dignitary next to the Emperor. Pertinax drew on himself the deadly hatred of the courtiers by his energetic measures against their excesses, and their venom

contributed not a little to his fall. Severus was also stern with the freedmen, but, under Caracalla, whose fortunes they shared, their power was all the greater. And the reign of Elagabalus heralded in fresh freedmen's *saturnalia*.

Though, occasionally, after violent revolutions, the entire domestic service of the imperial house was changed, for the most part it went on from reign to reign unaffected, and all the members might easily acquire an experience enabling them 'to veer their course to every wind'. Tacitus says of Graptus, who exercised an evil influence over Nero, that a life at the Court from Tiberius onwards had made him thoroughly conversant with the ways of Empire. One Claudius Etruscus had died at the age of ninety under Domitian. His father had been taken under Tiberius in his boyhood to Court, served under ten emperors, with only, it seems, one slight intermission of disgrace. Of his sovereigns six had died violent deaths; their blood-stained reigns had wiped out many an ancient family; and the face of the earth had been shattered and re-shaped: and, all this while, the old freedman went on in undisturbed enjoyment of his position, and his enormous wealth, and died in his bed. And so, too, hundreds grew up and rose to eminence in the palace, accommodating themselves to one sovereign after another, outliving one after another; if they had only told their tale!

But the higher they climbed, the more unsure was their foothold. As the historical survey indicates, many came by their fall, as soon as their riches awoke the Emperor's avarice (Nero had several rich old freedmen poisoned), or if their power was too overweening for him and the other favourites; when they attached themselves to the chiefs of the defeated side in throne or palace revolutions: their sharing in momentous deeds and resolves might prove momentous to themselves; for often was it their word that decided the issue of conspiracies against the Emperor, or the choice of his consort or heir.

The riches that streamed into them, in consequence of their vantage-ground, lent them their main strength. At this time to be as rich as a freedman was proverbial, and few could measure themselves with these servants of State. Narcissus had 400,000,000 sesterces (£4,350,000), the largest sum in one man's hands known to antiquity, and Juvenal

calculates his wealth as equivalent to that of Croesus and the Persian king: Pallas had 300,000,000 (£3,256,250), Callistus, Epaphroditus, Doryphorus and others scarcely less immense sums. When Claudius complained one day over the deficit in the imperial exchequer, it was said in Rome that, if he were to enter into partnership with Narcissus and Pallas, he would have a surplus. Epictetus tells a tale of Epaphroditus that a petitioner once fell at his feet, and bewailed his ill-luck; he had only 6,000,000 sesterces (£65,250) left; and Epaphroditus expressed his surprise at any one bearing such poverty in patience. It will be seen, too, that less prominent men were very rich. Apart from their profitable appointments, both in the provinces and in Rome, they had many opportunities of augmenting their possessions, without directly plundering, or extorting: for they had control of moneys in the imperial household; and they could skilfully avail themselves of circumstances. To mention only one point, naturally, every such employee saw he was paid for any assistance, real or otherwise, he might give in order to bring a request to the Emperor's ear and exercise influence direct or indirect on his decision. On one journey of Vespasian's the mule-driver dismounted, ostensibly to shoe his animals, in fact, to give a man the opportunity of petitioning the Emperor. Vespasian asked what the fee was for the shoeing, and claimed his share. Disseminating news as to the Emperor's speeches, intentions or moods was a very good speculation; often these costly titbits were only rumours (*fumi*); Martial already speaks of the 'traffic in empty rumour at the Emperor's palace' as a business: and later biographers regard the word almost as a mere technical term. Alexander Severus had one of his servants hanged for selling 'smoke' about him to a soldier for one hundred aurei, and, at his orders, his friend Verconius Turinus was smoked to death at the stake in the Forum of Nerva for making a livelihood in this way; a herald shouting the while, that he who lived by smoke, must die by smoke. Hadrian and Antoninus Pius kept better order at their Court, and none of their friends or freedmen 'sold' a word of what they said or did, 'as had been the custom of the Emperor's servants and courtiers'. New regulations were ever being made against this trade in false tales, and prove how impossible it was

to allay the evil permanently. A picture of Elagabalus' time in the childish wise of these biographies describes the dealing of one of his favourites and is fairly applicable to the greater part of the history of the Empire. Aurelius Zoticus, the son of a Smyrnaean cook, sold 'all the Emperor said or did, under false pretences, hoping for boundless wealth. He used to threaten one man, lavish promises on another and deceive them all. On leaving the Emperor's presence, he would tell them all singly: "I said this of you", or "I heard that of you", or "our fate will be that . . .". Such are some men who are admitted to the familiarity of the Emperor, but abuse the honour of both bad and good rulers. The folly or simplicity of the purblind Emperors let them grow fat on such scandalous swindles'.

The vast riches of the imperial freedmen enabled them to outbid the Roman aristocracy in luxury. Their palaces were the most pretentious in all Rome; that of Posides, the eunuch, outshone the Capitol, according to Juvenal, and all that was rare and costly on earth was squandered on its decoration. The poor man fears nothing, the poet says; but Licinus the rich is all a-tremble for his Phrygian pillars and statues, his beryl, tortoise-shell and ivory in his palace-rooms. In a dining-room built by Callistus, a freedman of Caligula, Pliny saw thirty pillars of oriental alabaster; four smaller columns of alabaster had been erected by Cornelius Balbus in Augustus' reign in his theatre as a great curiosity. The 'Baths of the Freedmen' were proverbially gorgeous, and the most splendid must have been those of the imperial freedmen. In the bath constructed by Etruscus, the son of an imperial freedman, marbles in frequent use, though costly, were discarded as too common, and the rarest only used in quantities; the ceilings gleamed with designs in glass mosaics, and from silver pipes the water gushed into silver vessels. Their parks and gardens were the largest and most beautiful in the city, their villas the most palatial in the environs. Would any menial of Nero's (the expression with which the hated and despised freedmen were designated), asks Pliny the Elder, have been content a little while ago with a garden of two acres? In Rome the parks of Pallas and Epaphroditus on the Esquiline were famous. Martial says that the garden in the palace of Entellus (a freedman

of Domitian) must be exalted above that of Alcinous ; there the purple grape ripened under glass, despite the wintry cold. But these freedmen also bedecked Rome and other cities in the monarchy with magnificent buildings of public utility. Cleander, the mighty freedman of Commodus, diverted a portion of his wealth to the erection of houses, baths, and 'other institutions, to the advantage of individuals and whole cities'. At various places, inscriptions record imperial freedmen as builders of temples, *thermae* and other great works, or the statues or honours awarded them in commemoration of their munificence. Their refined luxury out-rivalled that of voluptuous connoisseurs. One of Caligula's freedmen copied his master in having essences mixed with his bath-water. A hot well at Baiae was named after Posides, Claudius' eunuch, who discovered it, or made it fashionable. Patrobius followed the example of Alexander's generals in importing Nile-sand for his gymnastic exercises. Their mortal remains and those of their families were interred with oriental pomp ; colossal monuments, adorned with every art, covered over their ashes ; boastful inscriptions testified to all posterity how great they had been. Those on Pallas' grave (he died in 62 A.D.), recording the honours offered him by the Senate, all of which he would not accept, could forty-three years later (107 A.D.) so irritate Pliny the Consular, as to blind him to their humour.

The freedmen, sprung from races loathed and stained with the ineffaceable stigma of slavery, were despised and abhorred by the aristocracy of Rome, the descendants of immemorial families of great repute : and yet to these freedmen, who rightly ranked lower in many an aspect than a free-born beggar, the noblest had to pay homage and allegiance, because they were the omnipotent servants of the Emperor. For imperial freedmen ranked no higher than any others of their order, and the promotion some might receive from Emperor or Senate entitled them at the most only to the rights of the second rank, even if—what was very rare—distinctions pertaining to the first were added. The most common honours awarded, in the first century even, were the rank of knight by the conferring of the Golden Ring, and in dealing out this much, the Emperors seem to have been very sparing ; only the most deserving and prominent

favourites were selected, and the honour was not cheapened by excessive distribution. Thus Nero conferred knighthood on Pallas, Galba on Icelus, Vitellius on Asiaticus, Vespasian on Hor-mus and the father of Claudius Etruscus. At the same time, a new knightly surname was given them: thus Icelus was titled Marcianus, and Elagabalus' chamberlain, Aurelius Zoticus dubbed Avitus after his master's grandfather. If Narcissus had the insignia of the office of quaestor granted him, and Pallas those of the praetorship, this is accountable for by the anomalies of this dominion of the freedmen: it was to enable both to sit in the Senate. When Claudius gave all his procurators jurisdiction in fiscal matters, he thereby, says Tacitus, put the freedmen who superintended his private estate on an equal footing with himself and the law. Narcissus and Parthenius (the chamberlain of Domitian) even carried an officer's sword, a privilege belonging, not even to senatorial proconsuls, only to the generals appointed by the Emperor; it was perhaps as evidence of military authority over the Palace Guards. Claudius deigned to allow his freedman Harpocras to use a sedan-chair in Rome, and to organize public spectacles, but this was possibly a right appertaining to any free and responsible person. One military distinction (a blunted lance) Claudius with his usual tactlessness conferred on his eunuch Posides at the British triumph. The tutor of Lucius Verus, the freedman Nicomedes, before receiving this and other honours, had been raised to knighthood.

Thus (except for short periods) the outward distinctions of the servants of the Emperor were quite modest; in exteriors, their subordination socially and politically was to be kept intact as against the aristocratic dignitaries of the monarchy, with their high-sounding names, and show of pomp. In reality, the relations were reversed: the slaves, so deeply despised, had the satisfaction of 'receiving the admiration and envy of the free and the noble', of seeing Rome's greatest cringe to them: few were they who dared treat them as servants; one such was Lateranus (beheaded under Nero in the year 65) who retorted on Epaphroditus' inquiries: 'If I wished, I would speak to your master'. For Pallas his smug flatterers devised a genealogy tracing him back to his namesake, the King of Arcadia; and, in return for the

condescension wherewith this descendant of the kings of old preferred the good of the State to his own ancient rank, and deigned to serve his prince, it was a Scipio who in the Senate proposed a vote of thanks. In the year 52 A.D. one of the Consuls moved that Pallas be granted the insignia of the praetorship and the large gift of 15,000,000 sesterces ; Pallas accepted only the insignia. Thereupon followed a decree, that, fifty years afterwards even, Pliny the Younger blushed with shame and indignation to read. The Senate had already voted a considerable sum to this worthy patriot, and, the more his gentle spirit recoiled, the more persistently did they beseech the Emperor, the Father of his Country, to induce his treasurer to accede to their own wishes. But the Emperor, at Pallas' wish, and in his name, still declined the gift ; and the Senate recorded that they had voted, as a matter of desert and for their own satisfaction, these honours to Pallas, and that, even herein, they loyally would not wrongfully withstand in any wise their monarch's will. This decree was publicly exhibited, engraved in bronze (probably on an office of the imperial exchequer), beside a statue of Julius Caesar in coat of mail ; in it the owner of 300,000,000 sesterces was belauded as an example of stern disinterestedness. Lucius Vitellius, the father of the Emperor of that name, a man of very high position—at any rate, even in his day, a past-master in the art of servility—poured libations to golden pictures of Narcissus and Pallas, as his house-gods. Polybius often shared the walks of the two Consuls. And even Severus had to return to the Senate a decree of honour to his freedman, Euhodus, with the comment that it was scandalous for the Senate to pass such votes on a servant of the Emperor.

The strongest evidence for the position attained by these former slaves is that they could marry the daughters of noble and even imperial families, and this at a time when aristocratic pride in ancient lineages was at its height, at a time when the law forbade the female descendants of senators to the fourth generation to be engaged to or marry freedmen ; an enactment, dispensable at will by the Emperors, like the corresponding law, that senators might not marry freedmen's daughters. Felix, the brother of Pallas, the well-known administrator of Judaea, was the husband of three princesses :

the first was Drusilla, a granddaughter of Antonius, and Cleopatra; the second, Drusilla, a daughter of Herodes Agrippa; the name of the third is unknown. Nor did his descendants feel any shame of their ancestry. An inscription at Pola dedicated to one of his great-grandchildren, Lucius Anneius Domitius Proculus, expressly says of this boy of senatorial rank that he was a great-grandchild of Antonius Felix. The mother of Claudius Etruscus, a woman celebrated for her beauty, was the sister of a consul who commanded in the first Dacian War (86). Antistia Priscilla, the wife of Abascantus, Domitian's freedman, also came of a noble family. Agaclytus married the widow of Annius Libo, a cousin of Marcus Aurelius, as has been already said. These facts are chance survivals; but they justify the assumption that alliances between imperial freedmen and noble families were no rarity.

Every circumstance then combined to enhance to the utmost the complacent pride of these self-made men who had risen from the depths, and their insolence was the more defiant and open in proportion to the contempt with which they were regarded by those born in freedom and high rank. Once on the stage the verse was declaimed, 'Nothing more loathly than whipped curs in luck', and every eye turned on Polybius, who shouted back, 'The same poet also said, "Kings came of men who herded goats"'. Pallas, who did not conceal his sombre self-confidence even in the presence of Nero—who owed his throne to him—and at the last made himself intolerable, was arraigned in 55 A.D. for high treason. Some of his servants were named as accomplices: he replied he ruled his house by hints and signs, more specific orders were given in writing: he would not degrade himself by speaking to them. And, though their over-weeningness reached its height under Claudius, it was always very great, and any who dared confront them could be sure of general support. One of these probably rare incidents is recorded in Plutarch. An imperial freedman, who had just come into his fortune, was behaving snobbishly and rudely at a banquet to a philosopher, and ended by asking him why both black and white beans made a yellow stew, a question the latter countered by asking why black and white thongs produced red welts. Martial in one poem praises the demean-

R.L.M.

E

our of the freedmen of Domitian, but is scarcely more reliable than in his other laudations of this reign. Up till then, he says, the servile refuse of the sovereign had been loathed and the insolence of the Palatine a byword. But now the Emperor's men were universally loved, every man's family-friends, so gentle and considerate were they, so quiet their life, so modest their manner. No freedman had any individuality, except his master's; and this was the character of the imperial court. And the greater the arrogance of the imperial freedmen, the more effective would be their occasional condescension; Epictetus expressly mentions their friendliness as one of the things likely to wrest every secret from a man bent on externalities.

§ 2

In the administration itself the freedmen seldom held high positions; before Hadrian's reorganization, knights were regularly appointed to them. Thus the directors of the more important tax offices, for example, the 5 per cent. death-duty, were mostly knights. Still there were exceptions, partly in pursuance of imperial arbitrariness, partly because the only standard was personal fitness. The supervision of finance in the imperial provinces, and the raising of the revenue in the senatorial, was entrusted to freedmen; but more frequently they were departmental or subaltern officers of their superiors; the directors of the imperial camps (*procuratores castrenses*, an office important because of its close relation to the person of the Emperor) were for the first two centuries systematically freedmen; as also the procurators of the waterways of Rome, even after Hadrian had designated this post for the knights. In the wide and many-sided administration of the imperial estates, which, as time proceeded, expanded enormously throughout the entire Empire, and gradually assumed the character of Crown property, freedmen retained the direction of single parts, even after the superintendence of the whole had been transferred to the knights as procurators. Often they managed the imperial mines and quarries, afforestations and estates, and the parks, villas and palaces of Italy and the provinces, as, for example, Marcus Ulpius Euphrates was the procurator of Pausilypum (Posilipo near Naples), which passed into the private inheritance of the Emperor from the estate

of Vedius Pollio. The freedmen who, after Claudius, had the business control of the gladiatorial and animal shows, had, under them a large staff of men; a procurator, for instance, was specially set over the moneys devoted to the maintenance of the elephants. Of the salaries attached to the offices accessible to freedmen, we only know that of one, the procurator of the Roman waterways: this was 100,000 sesterces (£1,087 10s.). An imperial freedman, Euphrates, returns thanks (in an inscription at Lanuvium) to the 'genius of the place', for having enjoyed a yearly income of 100,000 sesterces, presumably an increase of salary.

As the freedmen, in matters of finance, so seldom received high rank, it is rather surprising that, for the whole of the first century, they remained in possession of the three posts of which Claudius so increased the importance, Finance, Petitions and Grievances, and the Secretariate—and at intervals, even in the second century. The reason is plainly that what was requisite was not personal rank (as for governorships, especially in the provinces), so much as reliability, submissiveness and aptitude.

In the imperial Finance Department (*a rationibus*), all the receipts of all the imperial exchequers were pooled and the total disbursements published. How extensive the operations of this department were is indicated by Statius' poem, written at the commission of the son of Etruscus to commemorate his father's life (a work which has already been made use of in several instances). Etruscus' father may have lacked an ancient lineage, says the poet; but fortune compensated him in large measure. No man from out of the crowd could be his master, but only they whose liege servants are the sunrise and sunset. Of that much he need not be ashamed, for, were there no law or discipline, what on high or below could exist? The dance of the stars, the moon and the sun obey set laws, Hercules and Phoebus had been thralls!

This Etruscus was born in the second decade of our era at Smyrna, came, at a very early age, to Rome to Tiberius' Court, and was manumitted by him (i.e. before 37 A.D.): under Caligula he maintained his position, and had a humble place in his retinue on his journey to Gaul: under Claudius his elevation began: under Nero, he underwent no change—he had steered his craft successfully. In the year 55 perhaps, when Pallas

resigned, the administration of the Holy Chamber (the Imperial Exchequer) was entrusted to him. The receipts from Iberian and Dalmatian gold-mines, African and Egyptian harvests, the pearl fisheries of the Eastern Seas, the revenues from Tarentine herds, and Alexandrian manufactories of transparent crystal, from the forests of Numidia, and the ivories of India ; whatever the winds from every point of the compass might waft in, he, and only he, administered. And the disbursements he must also assign. Through his hands there passes the daily food of the armies, the demands for the Roman distributions of corn, for the erections of temples, the construction of waterways and harbours, the adornment of the palaces of the Emperors, the statues of the gods and the mint. He has little sleep, and little time for meals, none for banquetings. Pleasure is not for him. Under Domitian (84) he fell into disgrace, but was only punished by relegation to the coast of Campania, whither his son accompanied him. In about 89 or 90 he was forgiven. Shortly after his return to Rome, he died (about 92 A.D.), nearly ninety years old. His grave was fragrant with flowers, the rarest essences scented his funeral urn. Painters and sculptors busied themselves to perpetuate the features of this whilom slave in the most precious materials ; the two most celebrated poets of his day wrote elegies on him, and have preserved his name and fate to posterity.

The office of Petitions and Grievances (*alibellis*) was politically of far less consequence. Under Claudius it was administered by Polybius, of whom repeated mention has been made, to whom Seneca as an exile in Corsica addressed his well-known and undignified *Consolation* at the death of one of his younger brothers. One ground for relief Seneca finds in the fact of the nature and importance of his work, which would preclude from giving way to his anguish : ' You must hear so many thousands of men, decide on so many petitions. To be able to lay before the mind of the supreme ruler such a vast mass of matters, streaming in from the four quarters of the world, in proper order, you must raise your own spirits. You who hear so many weep, must not yourself weep. To dry the tears of the many who are in peril and beseech the mercy of our gracious Emperor, you must first dry your own tears '. And, besides this office, Polybius was also Literary Counsellor to the Emperor. Amongst other things he had made paraphrases

of Virgil and Homer, and Seneca says, that, as long as the force of the Latin tongue, and the charm of the Greek, shall survive, so long will Polybius live among the spirits of the mighty. And this tone dominates the entire work. He is the only one of the powerful courtiers whose friendship is not merely advantageous, but also pleasurable. With his ease in gaining wealth, the only profit he purposes to himself is to despise wealth. He is universally respected; his luck raises no envious tongue. And so on.

Further, the Literary Counsellorship (probably instituted by Claudius) seems to have been a large, constant and well-staffed office at Court. In the fourth century, a second director (*adiutor*) is mentioned, with a salary of 60,000 sesterces. After the second century, it was regularly reserved to the knights. One Sextus, whom Martial requested to find room for his poems in the imperial or Palatine Library, was apparently both librarian and Literary Counsellor to Domitian. For he, the eloquent worshipper of the Palatine Minerva, was permitted to enjoy the intimacy of the god (the Emperor), and to watch the beginnings of the prince's works, and his secluded thoughts. In the third and fourth centuries a high official, a knight, was the principal conductor of the office of Literary Adviser.

The Secretariate (*ab epistolis*), the imperial Chancery, had two departments, Greek and Latin, each, beyond all doubt, under a separate head. But the supervision of the department in the first century was always apparently vested in one supreme authority. For the omnipotent Narcissus, who held the Secretariate under Claudius, can hardly have been subordinate, nor as such would he have held his place beside Callistus and Pallas. Under Domitian as well, the one official *ab epistolis* had the conduct of the whole. Statius describes the imperial secretary of his day, Abascantus, as being engaged in correspondence with the whole Empire, countries where Greek and where Latin prevailed—even a poetical account dared not contain any crude inaccuracies. Yet in the second century a change took place, perhaps in conjunction with Hadrian's general official reorganization. No doubt the Latin section was now made independent of the Greek, a separation eminently desirable in view of the frightful pressure of business. According to Statius no department in the 'holy' house was

busier, especially as the continual concentration of the government would augment the extensiveness of the work in this office more than in any other. And the staff must have increased more and more. One of the reforms of Julian the Apostate consisted in dismissing a number of useless scribes, who perverted their office into a system of scandalous blackmailings and extortions.

Statius dedicates this poem of his to the freedman Abascantus after the death of his wife, Antistia Priscilla, 'as he was ever unrelaxing in his efforts to serve the interests of all concerned with the Holy House, in so far as his weakness allowed, for he who loyally revered the gods, must also love their priests'. The Emperor, with his perspicuity into character, recognized the abilities of Abascantus even as a young man, and laid on his shoulders this titanic burden, the scarce bearable weight of this office of world-wide consequence. Abascantus now had to despatch into every land the monarch's orders, to steer through the currents and utilize the resources of the Empire, to receive the tidings of victory from the banks of the Euphrates, the Danube and the Rhine, or the news of the progress of the arms of Rome in the farthest lands, even in Thule. For never was the plume, the betokener of defeat, borne by the messengers, but they always brought the laurel-crowned lances of success. He decided on military promotions, and announced who is to be made centurion, or tribune, who is to have the command of a cohort, or squadron of cavalry. He must inquire whether the Nile-floods will ensure a good harvest, whether in Africa the rains have fallen, and infinite are the matters he must investigate; Mercury or Isis never had so many errands. Abascantus, in his panegyrist's view, was unmoved by his promotion; he was still calm, upright and modest; no Apulian or Sabine yokel more sober in eating or drinking. But he must have been very rich. According to Statius, Priscilla on her deathbed made her husband swear he would put up, in her name, a golden statue of the Emperor, on the Capitol, of 100 pounds (£4,500). Her funeral was royally magnificent. Every fragrance from the East was poured over her dead body, which rested on pillows of silk, wrapped in mantles of purple: it was embalmed and buried on the Via Appia near the Almo. Her grave was a palace, where her form was reproduced in the shapes of

different goddesses, in bronze as Ceres and Ariadne, in marble as Maia and Venus the Chaste. Its remains can still be seen.

The director of the imperial secretariate had also to be an educated man. The Emperor's letters and the rescripts of his agents had to be drawn up in the sovereign's name and in a form worthy of his majesty. Their calligraphy had also to be perfect. The names of some freedmen, which were no doubt conferred on them by their masters in consideration of their occupations, indicate literary culture and scientific knowledge : such as Tiberius Claudius Philologus, Titus Flavius Ilias, and perhaps Flavius Hermes. Naturally and probably such men would be made librarians ; thus Dionysius the grammarian of Alexandria, and son of Glaucus, succeeded the Stoic Chaeremon as school surveyor at Alexandria, and later became librarian and imperial secretary at Rome.

As the repute of this office, as of all the imperial offices, rose, especially after its restriction to the knights, it may be assumed that only known men of literary reputation were invested with it. Titinius Capito, who held it under Domitian, Nerva and Trajan, is reckoned by Pliny the Younger as one of the ornaments of his age, the restorer of the senescent literature ; he also wrote verse. Under Hadrian Suetonius became the imperial secretary ; he was already known as a learned and prolific writer, and his biographies of the Emperors are noticeable for their tone of precise and sober exactitude ; his over-confident manner to the Empress Sabina lost him the post. But in the second century, the control of the Greek section seems to have been the ambition of the Greek rhetors and sophists in a quite remarkable degree. They strove for the imperial confirmation of their literary fame, and for something more, for the brilliant post with its prospects of higher and remunerative promotions. The rhetor Avidius Heliodorus, who held it under Hadrian, obtained the governorship of Egypt, and his son Avidius Cassius dared reach out for the purple.

Yet how could such men who idolized eloquence as man's highest aim, not deem it a great advance, to be recognized by the Emperor as the first of living stylists, if thus appointed ? This at least was their view and that of their friends : their enemies asserted the Emperor could make them secretaries, but not good stylists. Marcus Aurelius and Commodus, according to the Atticist Phrynichus, had nominated the rhetor

Cornelianus the principal of their Greek chancery, as being a man of the highest standing in the learned world, and the most eminent of all. Phrynichus praises him as an orator of a pure and classical expression, the only professor of rhetoric, who brought his art back to its ancient and standard form ; he made the imperial court really Hellenic and Attic ; he taught others correctness not only in expression, but also in action, look, voice and attitude. Therefore—the Atticist continues in a ridiculous vein of exaggeration—the Emperors considered him worthy of the highest department of State, and entrusted to his keeping all Greek affairs, set him beside themselves to watch, and made him nominally secretary, really co-regent. Evidently the pride of the imperial chanceries of that day was no less than that of the papal chanceries at the Renaissance, and epistolary style esteemed no less by the sophists than by the humanists of the fifteenth century. Antipater of Hierapolis, the sophist, was the tutor of Severus' sons, and principal of his chancery, and Philostratus remarks of him that none wrote the imperial despatches better ; he spoke in a manner worthy of the Emperor, like an eminent actor correctly interpreting his piece. His letters exhibited clearness, a lofty range of thought, apt expression, and a proper terseness, the special ornament of a letter. The sophist Aspasius of Ravenna, imperial secretary possibly even under Caracalla, was the subject of a letter from Philostratus on the epistolary art. For his imperial despatches had too many purple patches, and too little preciseness. The Emperor's letters should not be couched in ornate and rounded periods, but should declare his purpose, and ambiguity must also be avoided when he sets forth laws, in which their own clearness should be the true interpreter.

§ 3

The imperial chamberlains, as has been remarked, began to be prominent much later than the palace officials of whom we have spoken. They were the heads of a large staff, consisting partly of slaves, partly of freedmen (but never of the free in the Early Empire), and had varying degrees of access to the Emperor's person : this may be the meaning of their 'first' and 'second' stations. Their great number may be gauged from the fact that a special service for their sick was

organized, and (from inscriptions of Hadrian and Antoninus Pius' times) for their supply of corn. Obviously a deft handling of opportunities would at all times have given them power. Cicero even boasts that he was not, for any purpose, approachable, when Proconsul of Cilicia, through his chamberlains, as had been usual in the provinces. Bontems, the first of Louis XIV's four valets, 'saw the whole Court at his feet, even the princes, the ministers and the proudest of the nobles'.

The example of Helikon, the Egyptian, at the Court of Caligula, instances the importance of the chamberlain even in the Early Empire. Our authority is Philo's report on the embassy of the Alexandrian Jews, in which, after oriental fashion, he is designated as the 'right-servant' or 'bodyguard'. Helikon was first a slave of a private individual, from him received a general education, and was presented to Caligula. At his Court he rose to the rank of principal bedroom attendant, and thus came into the directest contact with the Emperor. 'For, when Gaius was playing ball, taking exercise, at his bath and at his breakfast, and retiring at night, he was with him; so that he had the ear of the Emperor at his leisure, and on all occasions more than any other man.' According to Philo he owed his influence largely to his national gift for wit, jests and merriment, which he always spiced with Egyptian malice: he thus, heading his troop of Egyptians, infected the Emperor with his own inborn and developed hatred of the Jews. It was said he had been bribed by the Alexandrian ambassadors, to prejudice the Emperor against the Jews, partly with money, partly with the promise of honours to be awarded him should he come to Alexandria in the Emperor's retinue. The Jews, for their part, had attempted to retain him, but in vain; no one dared approach him, on account of the general haughtiness and brusqueness of his demeanour. Whether he was a freedman or, as Philo calls him, a slave is uncertain, very possibly a slave. Claudius had him executed.

At the Court of Domitian, the two chamberlains Parthenius and Sigerus were most important personages. Martial thus describes an old buffoon, who was making himself a byword with his Court relations: 'ten times a day, he will run up the street to the palace and talk of nothing but Parthenius and Sigerus'. Of the two, Parthenius held the higher rank: Suetonius gives him the later title of 'Praefect of the Bed-

chamber': he was so much in Domitian's favour, as to receive from him, as has been said, the right of carrying a sword. Martial begs him to hand a copy of his fifth book to the Emperor: 'you know the seasons of Jupiter's gaiety, when his own native geniality shines out, and does not reject suppliants'. Parthenius and Sigerus had an active part in the murder of Domitian, and the raising of Nerva to the throne, with whom Parthenius continued in favour. And now his hand could not be idle. He had to read so many requests, that he had no time over for the Muses, otherwise he would have devoted himself to his own Muse; for, Martial says, he was an excellent poet. Martial in the year 88 congratulated him on the fifth birthday of his son Burrus, and, in 93, received a gift from him of a fine toga, which was unfortunately worn out in 94. He now requested him anew, if he had time, to recommend his poems to the Emperor; without much prospect of success. When in the year 97 the Praetorians demanded the punishment of the murderers of Domitian, and killed them despite Nerva's refusal, he is said to have fallen.

But, one hundred years later, the position of the Emperor's chamberlains was very different. Already, as in an oriental despotism, they had their ranks and were the omnipotent mouthpieces of their sovereigns, all the more, as Commodus had been accustomed by Perennis the Praefect, to live a life of pleasure, and, for the most part, was away from Rome. Hence his freedmen ruled as they liked. The first of them, Saoterus, a Nicomedian, was powerful, and made the Senate vote his native city the right of holding a periodic festival and building a temple to the Emperor. Cleander displaced him, and handed him and others over to the executioner. Cleander was a Phrygian, brought to Rome as a slave and porter; he was sold in the open market, entered the palace and rose to be chamberlain. As such his power was unparalleled—in one year he appointed five-and-twenty consuls, and by means of extortions of every kind piled up an enormous fortune. After, partly at his instigation, the Praefect Perennis had been sacrificed to the fury of the soldiers, he filled and deposed for a time all these offices at his will—the offices standing next after the Emperor's—and finally assumed them himself with two others. As Praefect he carried the officer's sword, the sign of military command, a distinction seldom awarded to

freedmen, and hence was nicknamed by the people 'the belted freedman'. He was said to have aimed at the supreme power. At last, at a time of famine, the hatred of the populace burst into flame, and Commodus abandoned him (189); he and his principal supporters fell, and his head was carried about Rome on the point of a lance. The last chamberlain of Commodus was the Egyptian Eclectus. When he saw that his life was in peril from his moodish master, he plotted his murder with the Praefect Laetus and his favourite concubine, Marcia, raised Pertinax to the throne and died at his side in valiant fight with the soldiers.

Severus' chamberlain, Castor, whom Dio calls the best of the imperial staff, was murdered by order of Caracalla. Probably he held the same influential post under Severus, as had Festus, the chamberlain under Caracalla (*a memoria*). Of Elagabalus' favourite and chamberlain, Aurelius Zoticus, mention has already been made.

Besides these important officials of the Court, the Court actors and dancers should be mentioned. They were not always freedmen of the Emperor, but it is typical of our epoch that their rôle in his palace was often by no means insignificant. Amongst the numerous comedians of the Court, the pantomimes took first rank, as the upper classes were passionately addicted to this species of scenic representation, the women even more than the men; often did its greatest professors enjoy the Empresses' favour. The waking thought, says Epictetus, of no few people is to whom in the palace shall he send a present, how he can ingratiate himself with the dancer, or turn a slander on one into a gratification for another. The names and a part of the careers of some of the most famous pantomimes have survived. Pylades, the Cilician, founded this branch of the ballet, and credited himself with Augustus' gratitude for diverting the popular mind to the stage; he seems to have been his freedman; and the beautiful Mnester, Caligula's favourite and Messalina's constrained lover, Tiberius' freedman. He and Messalina were executed together in the year 48. Paris, the comrade of the debaucheries of Nero, who had him executed in the year 67, was a freedman of his paternal aunt, Domitia. Whether the Paris who exercised so much control at Domitian's Court was his freedman, is unknown. Another Pylades, a darling of Trajan's, was manumitted by Hadrian.

One Apolaustus, the second of that name, had been Trajan's freedman, as also a third Pylades, freedman of Marcus Aurelius and Lucius Verus. The first must have been an important personage at the Court of Commodus, as he was involved in Cleander's fall and executed. Agilius Septentrio, 'the first pantomime of his day', was a freedman of Commodus, brought up by his mother Faustina, and, at his imperial patron's inducement, a public actor. The dancer Theocritus, appointed by Caracalla to a high military command in Armenia, had been a slave of Commodus' chamberlain Saoterus. The verses of Juvenal are said to be directed against the second Paris, and thereby to have later on drawn on him the anger of another pantomime, and, in consequence, his banishment: 'what the princes cannot do for you, a dancer will; it is idle to visit the palaces: a Pelopea creates praefects, and a Philomela tribunes'.¹

And other stage artists are sometimes mentioned as influential at Court. Apelles of Ascalon, the most celebrated tragedian of his time, was Caligula's regular companion and adviser, and 'did all such things in full freedom as men of that stamp venture on, once they attain to power'. The Jewish ambassadors of Alexandria were of opinion that he, as an Ascalonite, would be their born foe, after Helikon the chamberlain, and inflame the Emperor against them. But, afterwards, he fell into disfavour, it is said, because he hesitated in replying to Caligula's question, which seemed the greater, *he* or *Jupiter*. Caligula had him flogged, and congratulated the sufferer on his melodious shrieks, agreeable even then. Through the instrumentality of the mime Alityros, a Jew high in Nero's graces, Josephus was presented to the Empress Poppaea at Puteoli and, through her intercession, obtained the release of some Jewish priests, whom the procurator Felix had sent to the Emperor in chains. Latinus, the mime, a master in his art, was a favourite of Domitian and proud of Rome knowing him as the 'servant of his Jupiter' (the Emperor). He reported to the Emperor the day's occurrences, and, as an informer, was feared.

Of the host of the remaining servants, the pages and boy-loves at least deserve mention. The name of Antinous is sufficient to remind us of the importance they might attain.

¹ Pelopea and Philomela are names of plays.

Martial and Statius vied in glorifying Carinus of Pergamus, the beautiful freedman, a eunuch and cupbearer of Domitian, who, as Martial says, of a thousand Ganymede-like servants was his Emperor's favourite. 'Dear boy', Statius addresses him, 'so oft chosen to hand the nectar and to touch that all-powerful right hand, which the Getae, Persians, Armenians and Jews, long to grasp!' When he first wished to have his flowing locks shorn, Venus with her Cupids hastened down to help him. They enwrapped him in a silk mantle, cut his hair with the points of two arrowheads, perfumed them with fragrant scents, and placed them in a golden bejewelled case, and sent this and a similar mirror to Aesculapius at Pergamus.

In a room on the slope of the Palatine towards the Circus, on the walls of which some pupils of the Pages' school have recorded their removal to the Court, inscriptions are found. These show that boys from the most outlying countries were here assembled (such as the Crimea and North Africa). Amongst these scribblings (perhaps of the epoch of the Antonines) the name of the 'believer Alexamenos' can be traced; his schoolmates mocked his Christian faith in a drawing roughly scratched into the stucco: he is praying to a crucified figure with an ass's head; the Greek legend is 'Alexamenos worshipping his God.'

§ 4

Of the women, slaves or freed, in the palace, naturally mention is seldom made; but some characteristic facts deserve mention. The Jewess Acme (Hacma is Syrian for clever) was Livia's slave, and heavily bribed by Herod the Great's illegitimate son Antipater, to join an intrigue against Herod's sister Salome. A letter from her to Antipater was intercepted, and she paid for her action with her life. Otho, the future Emperor, paved his way to a close friendship with Nero through an influential freedwoman of the Emperor, and did her every honour. To attain his end, he pretended love for her, in spite of her considerable years. A modern parallel suggests itself. At Louis XIV's Court, there was one Nanon, an old servant of Mme. Maintenon, and thus of great consequence: princesses deemed themselves happy to chance to speak to her; ministers, whilst working through Mme. Maintenon, bowed to her; the Duchess du Lude in 1696 won

her prize of becoming lady of honour to the Duchess of Burgundy by paying 20,000 thalers to Nanon, and this, too, after one evening, on which the King had been speaking of her with decided disapproval. 'Such is Court life' was the remark of the Duc de St. Simon.

It follows that the most powerful would be the Emperor's concubines. When Messalina was being effectively accused to Claudius, Narcissus induced two especially favourite concubines of the Emperor, Calpurnia and Cleopatra, by means of promises, gifts and prospects of greater influence, to further the enemies of the Empress. And sometimes the concubines might for a while bewitch the sovereign, but there was never a mistress-rule in the Roman Empire, a fact attributable, perhaps, to the old-world relations of the sexes, so utterly different from modern conditions.

The first Emperor to condescend to such an amour was Nero, then in his nineteenth year, and his choice fell upon the slave Acte, a Little-Asian, and the affair was so revolting that Annaeus Seneca, Praefect of the Night Watch, had to avow himself Acte's lover. The Empress-mother was enraged at a *liaison* with a slave, which threatened her influence; the older friends of the Emperor encouraged it in hope of working off his lusts in a harmless fashion. Nero's passion for Acte was so great that he even thought of marrying her; and men of consular rank were willing to swear to her royal pedigree from the Attali. But others soon supplanted her, and, last, Poppaea. She survived Nero, and, with two of his old nurses, did him his last honours, with a magnificent burial, which cost 20,000 sesterces. Some records of her large household of slaves and freedmen have come down; specifying two chamberlains, a runner, baker, eunuch, and a Greek vocalist. Drain-pipes inscribed 'Claudia Acte, the Emperor's freedwoman', have been found at Puteoli and Velitrae in her villas there, and tiles stamped with her name at her potteries in Sardinia.

But Caenis, the mistress of Vespasian, held her master all her life, by other qualities than youth and beauty. She had been manumitted by Antonia, the mother of Claudius, who employed her as a secretary, as she was remarkable both for fidelity and memory. Vespasian, whose early love she had been, after his wife's death, took her back. She must then have been nearly forty years old, as, before the death of

Sejanus (October 31) she was Antonia's confidant, and Vespasian's wife, Flavia Domitilla, died at the earliest in 52 (which was the date of Domitian's birth). The Emperor treated her as his lawful wife. All the more offensive must Domitian's budding insolence have seemed, who held out his hand to her to kiss on his return from a journey; she had offered to kiss him. Her influence on the Emperor gained her enormous wealth; she was even said to be Vespasian's means of accumulation. 'For she received money from all sides in return for the offices, procuratorships, commands, priesthoods, even imperial responses that she sold. For Vespasian never took life, but rather gave life for money. She was the receiver; Vespasian was supposed to connive.' She did not enjoy her power for long; she died in the first year of Vespasian's reign. Recently on the Via Nomentana a votive altar was found, dedicated to 'the manes of Antonia Caenis, freedwoman of the Emperor, their good patron', erected to her by one of her freedmen and his three children. And Antoninus Pius even was so much under the sway of a concubine, that gossip attributed to her the appointment of the praefect of the Life Guards, possibly Lysistrata, the freedwoman of his wife Annia Galeria Faustina. Marcus Aurelius, after his wife's decease, took a daughter of one of his procurators as concubine, rather than give his children a stepmother.

Panthea of Smyrna, a love of Lucius Verus, is indebted for most of her celebrity to the enthusiastic allegiance paid to her by Lucian, the wittiest author of that day, during a short visit of his to Smyrna in 162. Her beauty—so runs the work dedicated to her—can only be described in terms of the excellences of all the masterpieces of the Greek brush or chisel; she combined them all; her voice was embodied harmony; her singing more tuneful and melodious than the nightingale's; Orpheus and Amphion would listen to her and hush: she plays the cithar with no less art; she has an intense poetical feeling, and an intimate acquaintance with the works of the historians, orators and philosophers. She is an Aspasia in her experience and insight in politics, in the sharpness and quickness of her intellect; rather a greater Aspasia, in proportion as the Roman Empire excelled the Athens of Pericles: comparable to Theano, the wife of Pythagoras, Sappho or Diotima. And repeatedly is she praised for her kind and gentle spirit,

her affability and responsiveness, her true faith towards her lover. Fortune has not spoiled her ; with those who frequent her she moves on equal terms and unconstrainedly : her friendliness is the more attractive, as coming without any trace of haughtiness, from one so highly placed. And the manner of her coming proves her lofty position ; a brilliant retinue of maidservants, eunuchs and soldiers guarded her person. And, as possibly, the beauteous lady may have found this libation of praise over-plenteous, Lucian thinks fit to indite a second glorification, repeating the former but belauding her modesty as well. Panthea seems to have gained Verus' life-long love and survived him many years. And she forms the motive of one of Marcus Aurelius' pessimistic reflections on the vanity of earthly gauds. ' Does Panthea or Pergamus still sit by their master's coffin ? It would be perfectly ridiculous. Or Chabrias and Diotimus by Hadrian's ? And if they did, would the dead know of it ? And did they know of it, would they be glad ? And were they glad of it, would their favourites be immortal ? Was it not their doom, to suffer old age, and then to perish ? And what should their masters do if their loves died ? All is idle and fleeting ; an empty and rotting husk.'

The harem of Commodus comprised three hundred women and three hundred love-boys, and the position of favourite was won by Marcia for her beauty and mastery of courtesanship, some said, by magic. She maintained this rank for nine years. She was a former concubine of Ummidius Quadratus, who was executed in 183 as an accomplice in Lucilla's conspiracy. Commodus liked seeing her as an Amazon, calling himself Amazonius ; and in this costume, wished, for her sake, to appear in the arena : her picture is preserved to us on a coin, on which his head appears next to the head of a beautiful woman with the Amazon's shield. She received the honours of a lawful wife, and all the insignia of an Empress, except having fire carried in front of her. One word from her, and the Christians condemned to the Sardinian mines were set free : she was a Christian, or inclined to that faith, as had been her foster-father, Hyacinthus the Eunuch, the priest in the Roman Community, and several freedmen of the Court, and had a connexion with Victor, Bishop of Rome. In vain did she beseech Commodus on the last day of his life, on her knees and

in tears, to abandon his intention of taking up his residence in the gladiatorial school: she only excited his anger, and he decided to have her killed. Marcia learned of this accidentally, and forthwith concerted the Emperor's murder with two others, who had been condemned for the same reason, Laetus the Praefect of the Praetorium and Eclectus the freedman, who is said to have been her lover. The Consul Falco denounced her and Laetus as Commodus' comrades in profligacy at the first sitting of the Senate after the murder, but Pertinax absolved both on the ground that they had been forced to obey against their natural goodness. Didius Julianus had Marcia and all those concerned in the conspiracy against Commodus executed.

§ 5

Even the slaves of the palace were influential personages. They, too, might be very rich, their favour had to be solicited and their insolence endured. Such are the slaves Seneca refers to, as footmen or slaves of even lesser consequence, whose kiss is considered a privilege by some people, who go into their park in their sedan-chairs for this purpose. Hadrian saw a slave of his walking between two senators, and cuffed him for going in step with those whose slave he yet might be. One ground of the suspicion entertained against his brother-in-law Servianus was the fact of his having treated the palace slaves. But these examples of imperial severity seem to have been exceptional; otherwise they would scarcely have been expressly mentioned, as in the case of Claudius. 'How is it', asks Epictetus, 'that a man becomes suddenly intelligent, if he superintend the imperial privy? Why do we at once say 'What a sensible fellow that Felicio is!' I would rather have him dismissed from his privy and his sense. Epaphroditus had a shoemaker whom he sold as worthless. Later on, the fellow managed to get bought by some one in the palace, and became the Emperor's shoemaker. You should have seen the respect Epaphroditus paid him. 'How is the worthy Felicio? I have the highest regard for you.' And one of us asking 'What is Epaphroditus doing', the answer would be, 'taking counsel with Felicio'. And elsewhere the philosopher observes: 'If life were to be the gift of Felicio, I would rather die; he is unbearable with his pride and slavish insolence,

R.L.M.

F

But few dared entertain this view. A Numenius or Symphorus would have suppliants for favours kissing his hands, passing half the night outside his bedroom door, sending presents, to gain his support: even candidates for praetorships and consulates would woo him. Nero's able barber Thalamus and his cupbearer Pythagoras were spoken of in Rome full twenty-five years after his death.

As oriental customs after the third century thrust their way in, the imperial household became more and more multifarious. According to Libanius Julian the Apostate found in it 'one thousand cooks, one thousand barbers, even more cupbearers, and hives of table servants and eunuchs'; scarcely an exaggeration if, for example, the numbers in some sections of the household of the Sultan Abdul Aziz be considered, viz. 5,005 officials and servants, 409 watchmen and porters for the twenty-one grantees' houses, 359 cooks and 351 gardeners, etc. And of these palace servants 'not one' did not use his place as a means of defrauding, intimidation and pilfering; 'not one' who did not aim at owning land, driving his own gig, being a master, no less a one than his own, not content with mere wealth, but hankering after an esteem that should mask his slavery.

Only a few, of course, in this enormous throng, could become personally known to their master; often enough would ambitious souls be foiled, to the exultation of their fellows. The fabulist Phaedrus, as an imperial freedman, was at home with the servant-class, and tells the following tale not unwillingly. When Tiberius on his way to Naples was stopping at his villa at Misenum, and taking a walk in the park, one of the better-class slaves there employed ran and leaped about before the Emperor on all the paths he took, with his apron on, in gay clothing and well-shaved. At last Tiberius signed to him, but to tell the joyous hastener that his pains might have been spared: 'the honour of a box on the ears from my hand (the customary symbolic blow at manumissions) is not to be so easily purchased'.

Amongst the principal slaves were the *Dispensatores* (accountants, paymasters and intendants); not only at Court, but also in the many estates in Rome and the provinces. The *dispensator* of the Armenian War at its close purchased his liberty of Nero for 13,000,000 sesterces, a fact Pliny mentions as an atrocity. How large the earnings of the *dispensators* generally were, may be appreciated from the fact

that Otho could extort from an imperial slave for whom he had obtained such a post under Galba, 1,000,000 sesterces. A slave of Claudius, Rotundus, formerly the property of Drusilla, the sister of Caligula, and *dispensator* in Hither-Spain, possessed a silver vessel weighing 500 pounds, to make which a special workshop had been built, and many of his train, smaller ones. In a *columbarium* on the Via Appia near the tomb of the Scipios, there is a gravestone of a principal *dispensator* of Gallia Lugdunensis, a slave of Tiberius. It was erected to him by sixteen of his slaves (*vicarii*) who accompanied him on his return to Rome, during which he died. Such a retinue gives a perspective of the size of the whole household. There were three secretaries, two butlers, two chamberlains, two cooks, two walking attendants, a physician, a wardrobe keeper, a man of business, steward, and one unspecified.

§ 6

But not all the indispensable attendants of the Court could be freedmen or slaves; least of all, artists or scientists. Amongst these servants, but not slaves, of the palace, physicians, astrologers and the tutors of the princes are the most frequently mentioned.

The teachers in the imperial family were often eminent men. Seneca was a senator, when summoned to educate the eight-year-old Nero; and perhaps the same may be said of Fronto, when he took in charge the instruction of Marcus Aurelius (then Marcus Annius Verus) and Lucius Verus (then Lucius Commodus). Generally, it may be assumed, men of great reputation in their branch were selected; Quintilian had been for twenty years a teacher of rhetoric at Rome, before Domitian entrusted to him the care of his sister Domitilla's grandchildren. The famous Theodorus of Gadara was Tiberius' teacher of oratory. Amongst the teachers of Marcus Aurelius were the sophists Alexander of Cotyaeum and Herodes Atticus. When the teachers were of less standing they would be taken into the palace. When Augustus made the famous philologist Verrius Flaccus the tutor of his grandchildren, he took him and his whole school into his house, with a yearly salary of 100,000 sesterces. Apollonius the Stoic, whom Antoninus Pius chose to educate the future Marcus Aurelius,

and summoned from Chalcis, refused to enter the Tiberian palace where Marcus Aurelius lived ; the pupil must come to the master, a request accorded by the heir-apparent. Pertinax made his son frequent the public schools and gymnasias ; he was acting quite exceptionally. Three royal tutors attained the Consulate: Seneca in 57, Fronto in 143, but only as *suffecti*, and Herodes Atticus, 143, with the full rank. Consular insignia were bestowed on Quintilian at the instance of Domitian's cousin Flavius Clemens, and on one Titianus, perhaps the teacher of the younger Maximinus.

A medical staff was a part of the imperial household, and very numerous, owing to the many palaces and estates and servants' apartments, and the medicine of the day was highly specialized. Nevertheless the selection of physicians was based on confidence and confidence on professional skill ; and the medical servants of the palace would only be employed for slight and subordinate occasions. In the Early Empire the physicians received a yearly salary of 250,000 sesterces. Quintus Stertinius considered he was making a personal sacrifice in accepting double this sum, as he proved that his town practice brought him in 600,000. His brother, Gaius Stertinius Xenophon, received from Claudius the same amount, and both, after exhausting their property in great improvements of the town of Naples, left 30,000,000 sesterces, whilst another imperial physician, Arruntius, alone left as much. After the death of Demetrius, the physician, Marcus Aurelius, then on the Danube engaged in the German War, inquired of the head of the imperial finance department which doctor was actually in the imperial pay, and on hearing that it was Galen, who had all the time superintended the preparation of the drugs, directed he should also make the theriac. Under Alexander Severus, only one Court physician received a salary, and the rest, some six or seven, only their board. In the last centuries of the old world, the imperial physicians (*archiatri sacri Palatii*) took a high rank, confirmed to them by Theodoric.

Generally speaking, the physicians at the Court of Rome were Greeks, such as Tiberius' doctor, Charicles, and the two of Nero, both named Andromachus, the elder being a Cretan ; Trajan's physician, Crito, who accompanied him on his German campaign ; Hadrian's physician, Hermogenes ; Marcus Aurelius', Demetrius ; and Galen, the physician of Commodus. In

return for their work, these Court doctors probably received Roman citizenship, if not originally possessing the suffragium, like Titus Claudius Alcimus and Titus Claudius Menecrates. Antonius Musa, a freedman, was rewarded with a statue, and the golden rings, and exemption from taxation for himself and his associates, in return for curing Augustus in 22 B.C. Gaius Stertinius Xenophon, an Asclepiad of Cos, the physician of Claudius, was both medical adviser and holder of a palace situation; he secured himself, his brother and his uncle, the *civitas* and the military tribunate or knighthood, and for himself the important military post of *praeфекtus fabrum*, as well as the distinction of the wreath of gold and the lance at the British Triumph 43 A.D (no doubt he had accompanied Claudius in his campaign); for his native island, exemption from taxation as well. His grateful fellow-countrymen erected a statue to him and, in his memory, struck coins bearing his effigy. He is said to have been Agrippina's accomplice in the murder of Claudius. His monuments record his titles; he was not only, as usual, 'the Emperor's friend', but also 'the friend of Claudius', and, after Claudius' murder, 'the friend of Nero'.

The enemies of the medical craft imputed to them the habit of poisoning, of committing adultery with wives of princes, to whom their practice gave them free access. According to Pliny, Vettius Valens of Ariminum (where monuments of his family are still extant), a famous physician under Claudius, was Messalina's lover: 'he and she were executed together in 48, also Eudemus, who attended Livia, the daughter-in-law of Tiberius, and connived at her adultery with Sejanus, and himself cohabited with her'. Naturally the imperial physicians enjoyed some higher reputation with their colleagues at Rome. Galen boasts of having restored the rhetor Diomedes, who lived in Sandal Street, to health in a very short space of time, whilst the Court doctors failed to understand his illness and treated it wrongly.

Nor were astrologers likely to be lacking at the Court; they were mostly Greeks or Orientals. True, astrology conjured up peculiar dangers for a throne. Their prophecies would awake sleeping passions, stir mischief into life, and convert the dreams of faith into success through fatalism. Seneca, ridiculing the astrologers, says, that every day and every hour had been foretold by them as that of Claudius' deification. Otho's courage,

after Galba had adopted Piso, was not allowed to falter by the soothsayers and Chaldaeans, who beset him ; one Ptolemaeus especially had forecast his survival of Nero and his accession, and now claimed credit for the fulfilment of the half of his prediction. The Chaldaeans, according to a Christian writer of the third century, bring ruin on monarchs, by filling the rulers with fear, and the ruled with audacity. Hence there ever ensued new edicts against astrology, and periodic expulsions or penalties against the Chaldaeans, always in vain. Nearly all the Emperors made astrologers their counsellors, and an initiation into the secrets of this superstition was attained by many of these monarchs. Tiberius was noted for his reserve ; but his Court ascribed a boundless influence to the astrologer Thrasyllus, his inseparable and life-long companion. Vespasian was particularly addicted to this superstition, and accorded Barbilla, an astrologer of Ephesus, the institution of a periodical festival at his native town, often mentioned in inscriptions as the *Barbillaea*, a privilege that fell to the lot of no other town. This same famous astrologer it was, whose advice to Nero, at a visitation by a comet in 65 A.D., made him have several of the aristocracy beheaded, so as to forefend the imagined danger. And Poppaea, too, had much secret conference with many astrologers, who had been her 'unhappy aids to her imperial marriage'. Often the fate of princely houses lay in Chaldaean hands. Tiberius had many killed, after ascertaining their hour of birth and therewith their character and coming career. Caracalla too consulted the horoscopes of the leaders of his court, so as to gauge their disposition friendly or hostile ; and, on this evidence, awarded death or honour. An individual in whose horoscope the Chaldaeans read a throne, had generally no choice but to suffer his own death or contrive the Emperor's. The death of Nerva is said to have been determined beforehand by Domitian for this reason, and only averted by a kindlier astrologer who made the Emperor believe Nerva had but few days to live.

III. THE FRIENDS AND COMPANIONS OF THE EMPEROR

Knights or senators, who attended the Emperor personally, were called his friends. They were preferentially invited to

the imperial privy council, formed under Augustus out of senators. Tiberius 'requested of the Senate, besides his old friends and intimates, twenty of the most prominent statesmen to act as his advisers in public business'. Amongst the later Emperors, the appointment of a similar council is not reported, save of Alexander Severus. But in the decision of matters of weight, military or political, the Emperors usually took into counsel eminent senators or knights and naturally their friends especially. The men of rank (*proceres*, almost all consulars, besides the two praefects of the Praetorium) are repeatedly called Domitian's 'friends' by Juvenal in his account of how Domitian hurriedly summoned them to his castle at Alba to advise: 'as though he wished to intimate news of the Chatti or the savage Sicambri, or some shocking event on the other side of the world', but really to consult as to the best fashion of dishing up a big sea-fish.

But, whilst such systematic transactions of a special council in emergencies seem sadly infrequent, Augustus and all the later Emperors respected the ancient tradition of not deciding judicially before gathering their friends and advisers, and hearing their views. Such an assembly was convoked by Claudius and comprised twenty-five senators and sixteen consulars. Up to Trajan this council remained unorganized. After Hadrian, however, the members of the *consilium*, called the *consistorium* under Diocletian, met as regularly appointed councillors (*consilarii Augusti*), and if in this council the Emperors selected the advisers for every separate occasion, and jurists were naturally preferred, the friends and companions of the Emperor must always have been numerous, especially those from the ranks of the knights. Probably, too, the palace and Court officials would have been attached from an early date: 'after the end of the second century, the praefects of the guard even took a prominent part'.

Partly as members of this political council permanent or provisional, partly unofficially, the friends would exercise much influence on the changing governments: examples are—to mention no others—Maecenas and Agrippa as the friends of Augustus, Sejanus of Tiberius, Seneca in Nero's earlier period, and Tigellinus in his later. They were esteemed as the men who determined the matters of the greatest moment, and very often did, in fact. When, in Nero's first year, the

Parthian War broke out, Rome awaited the names of the generals in order to judge the quality of Nero's friends. Marius Maximus, the biographer of the Emperors, even said the security of the State lay rather with the goodness of the Emperor's friends than in the Emperor's virtues: the evil-minded man might be reined in by many good, but against many evil one good man could not prevail. Dio of Prusa, in one of his paraenetic addresses to Trajan, says the ruler's truer eyes are his friends: through them his sight could pierce to the ends of the world; they are keener ears that let him know all he need; more useful tongues and hands, which could converse with all humanity and never fail of any project, which could effect much at the same time, give many synchronous counsels, and be omnipresent. And he, with his high powers of reward, could choose the most reliable and capable. 'For who can grant more honours? who depute with more authority the conduct of a war? From whom might greater distinctions flow? Whose board is more honourable? Were friendship to be bought, who has a greater superfluity of wealth, so that none could return the like?' His friends' advice nearly induced Trajan to adopt not Hadrian but Neratius Priscus. Antoninus Pius 'decided no provincial or State matter, without consulting his friends and formulating his despatches in accordance with their views'. And as his end drew nigh, he summoned his 'friends and praefects', confirmed to them Marcus Aurelius as his heir, and recommended them to him. Marcus Aurelius always discussed questions of war and peace with the *optimates*, his view being that it was better he should bend to so many good friends, than they should surrender their wills to his!

And the Emperor's friends were respected and dreaded. Pliny the Younger says, as a young man, he undertook an action (under Titus or Domitian) against the mightiest statesmen, and the friends even of the Emperor! 'I will become a friend of the Emperor's', says Epictetus, 'and then no one will dare tread too near'. The power conferred by this position was often abused. The biographer of Alexander Severus describes his friends, to whom he entrusted both home and foreign affairs, as models, because they did not exhibit his catalogue of faults and vices and wrongs, generally attributed to men of their standing. This list includes thieving, ambition, evil propensities, lust, cruelty, circumvention of their

sovereign, whom his friends used to scoff at, and cheapen by their venality, mendacity and fabrications.

These 'friends', even in the Early Empire, soon came to have formal distinctions, which crystallized round the old Roman practice of the morning receptions in the great houses. In the early Republic even Gaius Gracchus and Livius Drusus are said to have organized their party, by dividing it into three sections; the first of which they received in private, the second in larger numbers, and the third in assembly. This distinction of 'friends of first-class and second-class admission' obtained at the Court: men were entitled to a 'first or second greeting', and thus officially inscribed, alive or dead, as one of the offices or honours he had held. The personal relation to the Emperor, and not mere rank, was the determining factor. Friends were, in the first place, kinsmen and the friends of his youth, and, after them, the most eminent senators, such as the *Praefecti urbi*, consuls and consulars, and lastly younger men, at the beginning of a career, which thus portended a brilliant future. In this way Lucan attained the quaestorship, after being summoned from Athens by Nero, and admitted amongst his friends, and Otho (born in 32), the future Emperor, made himself a high place amongst them as a companion of Nero's debaucheries about the year 55, before holding the quaestorship. And from the second order, also, the Emperors would choose their attendants: Augustus may have given knights power and influence by preference, such as Proculeius, Sallustius Crispus, in order to lessen the importance of the Senate: the practice continued, after the reason had ceased. The highly placed praefects of this order, such as the governor of Egypt, the praefect of the Praetorium, and the sub-praefects of the nightwatches, who also controlled the fire-brigade and police, and were subject to the City Praefect, and the praefect of the Corn Supply so essential to Rome, were *ex officio* friends of the Emperor.

As time went on, the title of Friend of the Emperor became indissoluble from certain high offices, and meaningless. In a rescript of Severus and Caracalla in the year 201 an immunity was granted to the citizens present and future of a certain town in Moesia, 'subject to their being declared proper recipients of the citizenship of Rome by our friend the Consular Legate for the time being'. But perhaps in the first years of Marcus

Aurelius all consular legates already bore the title of 'Friend of the Emperor'. An inscription of 163-165 A.D. informs us that the two reigning Emperors had restored a road near Abila through Julius Verus, praetorian legate of the province of Syria and their friend; it was doubtlessly set up by the legionary tribune who conducted the work. And during the first centuries there were degrees of this title. In the legal style of the fourth and fifth centuries the three highest officials (*praefectus praetorio*, *praefectus urbi*, and *magister militum*) have the title of *parens*; other officials of the first rank (such as the *magister officiorum*, and the *comites rerum privatarum* and *sacrarum largitionum*) those of *frater*: lesser officials, such as a consular of Picenum, a praefect of Egypt, are only addressed as *carissime* in the documents preserved. The beginnings of these official addresses can be traced in Trajan's letters to Pliny the Younger, as imperial legate in Bithynia, who is always addressed as 'dearest', and in Commodus' appellation of the praefect of the Praetorium as 'father': and doubt becomes certainty when Severus in 222 addresses the jurist Ulpian as the praefect of Corn as his 'friend', and as praefect of the Praetorium in the same year as 'father' (*parentem*). Didius Julianus, at his first reception of the Senate and the knights distributed the titles of 'son', 'brother', 'father' wholesale, according to the ages of the assembly. Further, it would follow of itself that the title of 'friend' would be more frequently bestowed by the Emperors on others than assumed by individuals or conferred by any third party, a fact confirmed by the business style and by the inscriptions.

The friends were often invited by the Emperors to their repasts, as, for example, by Hadrian: Antoninus extending this to ordinary as well as great occasions. Marcus Aurelius reckons among his father's precepts, the obligation of not compelling his friends to dine with him, and showing no disfavour to those who abstained: but what his self-esteem deemed a merit, was taken in evil part, and in the absence of the friends from the society and banquets of the Emperor, a fresh aggravation given to Court pride. Alexander Severus used to have some friends to dinner uninvited. The service of the friends, some of whom, even in Rome, lived permanently or for a time in the palace, was deputed to a certain section of the staff (*a cura amicorum*).

On every journey or expedition the Emperors used to select some of the friends to accompany them (*comites*), and this retinue (*cohors amicorum*) is exactly similar to that of the Republican proconsul. Hence the Emperors could only have 'comrades' in the technical sense, when they journeyed outside Italy, and when Caligula summoned a 'cohort of friends' to escort him in light Gallic carriages on his triumphal procession over the bridge of ships built from Baiae to Puteoli, he was acting the part of the emperor returned from his campaigns. Lucius Verus was provided by Marcus Aurelius with a train of imperial friends of senatorial rank, on setting out for the Parthian War. Of course this great honour of selection was a virtual command, but Marcus Aurelius put no pressure on his friends in this instance, as he himself remarks. Galba, as a member of the cohort of Claudius, enjoyed the rare honour of having the expedition delayed one day since he was ill.

On the journey the friends lived with the Emperor, or provision was made for their housing: Vespasian accompanied Nero on his journey to Greece, fell into disgrace and was banished from the common home. In the imperial camp a special place in close vicinity to the imperial tent was staked out for his suite. They were paid during their journey. Even in Cicero's day it had become customary for a proconsul to afford his officers and retinue a largess proportioned to their rank and length of service. One mark of the parsimony of Tiberius was that he (as prince) gave his escort on his travels and campaigns no fee, but only the daily pay in the stead of their food. Once only did he give a largess in money, the means being found by Augustus: the first-class received 600,000 sesterces each, and the second 400,000. And complaints were raised at the meanness of Augustus' gifts to his friends. Caligula's travelling companions found their necessary expenses ruinous. The retinue was a weary burden for the regions it traversed; a fact vouched for by the comparison Pliny makes between Domitian and Trajan. For Trajan 'had no tumults, no insubordinate grumblings over the quarters: all shared the same provender, and the escort was kept in strict discipline'. Antoninus Pius, who never travelled outside Italy, remarked that, however sparing the prince, the retinue was none the less a burden on the provincials.

The work of the Emperor's escort was assigned by the

Emperor. In the field, they did military service ; and, after a successful campaign, received their share of the distinctions awarded. But their usual function was to assist their sovereign in judicial and administrative matters, a privilege not accorded to the knights but to the senators and quaestors, and even to young men, who had just made their first bow in the Senate.

The Emperors treated the friends to a certain extent with the usual social courtesies, and like private individuals, in so far as their affability, real or pretended, permitted. At the beginning of his reign Tiberius used to attend the courts on his friends' behalf, and frequent their sacrificial feasts : visit them in their illnesses without his guard, and even delivered the funeral address for one of them. Claudius, however, never paid his visits unattended by his guard, a precedent that became the rule with few exceptions, e.g. Trajan. When Galba the Emperor dined with Otho, Otho, apparently to do his guest honour, gave every man in the cohort on guard a gold piece. Nero, who at the beginning of his reign bestrewed his friends with gifts, incited in them a corresponding extravagance, when dining with them, or otherwise : such a banquet would cost more than 4,000,000 sesterces in roses alone. He had a doctor summoned from Egypt to tend his friend the knight Cossinus, who lay ill. Severus and Caracalla are praised for the readiness with which they supplied their friends with rare medicaments, unpurchasable by private individuals and stored in the imperial palace. The sociability of Trajan was particularly admired : he would join in his friends' hunting-parties, drinking-bouts, enterprises, consultations and jests, visit them when sick (emphasized by Ausonius), even, as already said, without his guard. He was, says Pliny, really loved by them, as he really loved them ; he even denied himself his own desires, so as to fulfil theirs. He allowed a praefect of the Praetorium to retire contrary to his own wish, and thus ' an unimaginable event occurred, that, of two conflicting wills, the Emperor gave way to the friend '. And Hadrian condescended further in quest of popularity. He visited the sick among knights and freedmen in Rome, consoled and counselled them, and attended his friends' banquets. At the *saturnalia* he used to exchange gifts with them, send them presents of game, drove with them in fours and went to their palace in and out of town ; a knight is described in an inscrip-

tion as 'guest-friend of the divine Hadrian'. One of his friends, Platorius Nepos, escaped scot-free, for refusing his house, when ill, to the Emperor. Antoninus Pius and Alexander Severus frequented their friends' banquets: the latter the sickbed, not only of friends in the first and second orders, but even of those humbler placed. Some Emperors took a rebuke or reproach of their friends in good part. Vespasian permitted his friends a great deal of free expression, and brooked astonishingly much from Licinius Mucianus. When Antoninus Pius once asked his friend Valerius Homullus (consul in 152), whilst visiting him, whence he had the porphyry pillars in his palace, the latter replied—for they could only have come from the imperial quarries by the Red Sea—: 'in another's home, one must be deaf and dumb'.

The Emperors used to make very generous gifts to their friends. Nero, as has been said, enriched the first of his friends, immediately after the death of Britannicus (55). Men who claimed respect were blamed for dividing their booty of palaces and villas at such a time amongst themselves. Seneca was especially intended in this attack; in 62 A.D. he defended his immense riches in a letter to Nero, countering his critics by saying he could not refuse his prince's offerings. Now he will put them at the Emperor's disposal, an offer the latter refused in a conciliatory letter, and bade him retain all he had received, gardens, rents, and villas. According to Pliny, Trajan, also, at his accession, freely distributed the most picturesque estates, and regarded 'nothing as his own, unless his friends possessed it'. Hadrian's munificence was unsolicited, and invariable. Antoninus Pius made use of his large private property, on his accession, in largess to the army and his friends. Marcus Aurelius was especially generous to the friends of his youth, and in inverse proportion to the offices he could bestow. Severus paid his friends' debts: more than this, his 'nature, passionate in love and in hate', showered on them riches and palaces, of which those of the Parthians and Laterani were in the fourth century the most notable in Rome. Of Julian the Apostate's friends the best refused the gifts of 'land, horses, palace, silver and gold', whilst others were avaricious. On the other hand custom demanded that the friends should remember the Emperor in their wills, especially as legacies used to be left to him by all propertied men. Augustus, who laid overmuch stress

on the 'last decisions' of a will, and took no pains to hide his gratification or disappointment, in the last twenty years of his reign, received through bequests from his friends 1,400,000,000 sesterces (£15,000,000), and instituted several friends and relatives as heirs in the third place.

The highest ambition of courtiers was a grievous oppression to philosophical onlookers from without, who regarded the imperial friendship as a lot of supreme misfortune, constraint, disquiet and anxiety. They had to be adaptable to the Emperor's every whim of taste or fancy. Galen tells us that the courtiers of Marcus Aurelius the Stoic, became stoics to the extent of wearing their hair short; Lucius Verus had utterly diverse views, and jeered at this fashion as befitting a mime; long hair came in again. They might not even sleep, says Epictetus. The news arouses them that the Emperor is up and about; fresh excitement and perplexity. They are not asked to dine; more anxiety: they are asked, and dine like slaves at a master's table, fearful of saying something awkward or untoward. And the cause of this fear? Is it a slave's whipping? Nothing so good. Their risk, the danger for so many men in high position, is the loss of their heads. At the baths, in the gymnasium they can have no peace. Who would be so dull or false to himself, as not to bewail every instant of his life as the Emperor's friend?

And actually the position was often not only difficult, but perilous. Ever and again would the sudden headlong fall of the mighty proclaim the insecurity of the favour of princes. Seldom, says Tacitus, is the power of a favourite assured; perhaps satiety seizes the sovereign, who has bestowed his all, or the recipient, who has received his all. Eprius Marcellus, when upbraided in the Senate under Vespasian with Nero's friendship, replied it had been a source of tribulation to him, no less than banishment to others. Seneca says in one work, written under the recent reminiscence of Caligula's sway, that one courtier was asked, how it was he had attained old age at Court, where grey hairs are so seldom seen: it was, he said, because he swallowed insults with a grateful countenance. Often the Emperor in his heart hated his so-called friends, and Domitian's Court was not unique in the 'paleness of the unhappy friendship of the mighty' reflected on their visages. The ill-will and distrust of the princes were easily stirred up; slander

and intrigue had a busy time at Court. Few Emperors had such unassailable confidence in their friends as Trajan had in Licinius Sura, against whom constant calumny was unavailing. For all that Trajan visited him unannounced, let Sura's slaves anoint his eyes, shave and bathe him, and dined at Sura's house. And the next day he retorted on Sura's foes with the remark : ' had he wished to kill me, he could have done so yesterday '. Suetonius praises the constancy of Augustus in friendship, as, despite occasional disturbances in his relationships to them, none was crushed, except Salvidienus Rufus and Cornelius Gallus ; they all retained power and wealth to the end. The instance of Fabius Maximus is, however, forgotten ; he fell into disfavour only a few days before Augustus' death. On the other hand, out of all the friends and advisers of Tiberius only two or three escaped. Caligula rewarded those who had helped him to the throne with death. In the pasquil of Seneca Claudius is welcomed in the underworld by one of those he had sent to anticipate him with the greeting, ' Hail, murderer of all thy friends '. Hadrian's favour was very mutable. Sometimes he would overwhelm his friends with gifts, sometimes listen to every voice of calumny and spy their doings in their own houses. Those whom he raised he treated afterwards as his foes, and no few perished at the hands of the executioner, or by their own. Julian, in his panegyric of the Emperor Constantius, says that none of his friends could complain of disgrace, maltreatment, loss or deprivation of any kind. Even those who proved unworthy of their promotions were not punished, but only relegated. Some of the imperial friends reached a great age, keeping their positions and dying in harness, and leaving their property to their sons, friends or relatives ; others, weary of work and war, lived on in honourable retirement. Many who died young were reckoned among the happy.

The Emperor's wrath was dire and unfailing as a thunderbolt. The luckless sufferer was forbidden the palace, according to ancient Roman custom, on a breach of friendship : and such a judgment was felt as the severest condemnation. Decius Junius Silanus was convicted of adultery with Augustus' granddaughter Julia, forbidden the company of his prince, and acknowledged this as a hint and banished himself (8 A.D.). In the year 20 Tiberius permitted his return at the intercession

of his brother Marcus Silanus (consul in 19 A.D.), but informed him he had the same feelings towards him as his father. Silanus lived in Rome, but undistinguished. The victims of imperial disfavour might often fare worse. Cornelius Gallus rose from a lowly walk of life to be praefect of Egypt, and then drew on himself Augustus' displeasure. He was excluded from the palace and his province, and forthwith his supporters deserted him, prosecutors rose up against him, and the Senate in all haste decreed his banishment and the confiscation of his property; he had to anticipate the execution of the judgment by suicide. The Consular Fabius Maximus, one of Augustus' most trusted friends, betrayed a secret to his wife; this came to Augustus' knowledge. He at once manifested his anger, and rumour attributed Maximus' swift death to his own act. Sextus Vistilius, a man of praetorian rank, had been closely associated with Drusus the Elder, and hence was included among the friends of Tiberius. The Emperor forbade him his society, and he tried with his weak hands to open his veins, and then bound the wound up and wrote begging for mercy. The answer was unfavourable, and he again untied the bandages. Vespasian, the future Emperor, was a consular, attending Nero on his journey through Greece, and drew Nero's anger on him for often going away or sleeping whilst Nero sang. At once he was banished from Nero's suite, and Court. Confusedly he cried out, What should he do, where should he go? and one of the freedmen drove him away with a curse. Vespasian, fearing the worst, hid away in a little far-off hamlet, and so succeeded in evading the Emperor's further observation. Sometimes relegation from the Emperor's neighbourhood was an honourable banishment. Nero made Otho, the coming Emperor, once his favoured friend, governor of Lusitania, though he had only been quaestor, and so contrived an undisturbed possession of his wife Poppaea.

Yet, despite their bitter experiences, the atmosphere of the Court almost irresistibly attracted most of those who had lived there. Epictetus tells us of a man, then holding the high office of praefect of corn, who had been once banished. On returning from exile, he asseverated his intention of passing the scanty years that remained to him in peace; Epictetus foretold he would change his mind, as soon as he again breathed the air of Rome. He swore, should he ever set foot in Court again,

Epictetus might think of him what he would. Yet, scarce arrived in Rome, he received a letter from the Emperor, and instantly all his good intentions were blown into thin air, and one busy department after another fell to him.

The Emperor's death scarcely seems to have affected the position of the friends, except if the relation were personal; otherwise they kept their places in the new Court, unless some radical change in polity and persons had taken place. Titus chose friends 'so as to prove indispensable to his successor as well, and the foremost servants of sovereign and State'. The new ruler was also actuated by 'piety' in treating his predecessor's friends as honourably as he could: when the late monarch was deified, his priests were generally chosen from among his nearest friends. This was how Marcus Aurelius and Lucius Verus proceeded in appointing the priests of Antoninus Pius. Domitian was guilty of a breach of piety when he relegated and persecuted his father's and brother's friends, and Commodus, when he acted in the same way towards those of his father. Revolution certainly brought about the fall of those friends who were intimately associated with the Emperor: thus Severus had Didius Julianus' friends banned and executed immediately after the death of their patron. But even then it might be that the friends of the fallen monarch maintained their position. One of Galba's most trusted supporters, Marius Celsus, consul designate, was taken up by Otho as his confidential adviser, a piece of astuteness which not only made an adversary into a constant and true friend, but also assuaged the aristocracy. And so, too, Nerva, from over-great clemency, tolerated the presence of Domitian's most unpopular friends at Court. Once one of them, Fabricius Veiento, was dining at Court, and the conversation turned on another abominated personality of the time of Domitian. The Emperor asked, Were he now alive, where would he be? 'Here dining with us', was the answer of Junius Mauricus, who, under Domitian (93 to 96), had been banished.

Sometimes, as has been said, the friends might be playmates of the Emperor's youth. One cause of this was that children of highly placed families and foreign rulers were brought up at Court, generally because this would in many respects be highly advisable. Augustus took, as has been remarked, Verrius Flaccus, the philologist, and his whole school into Court; he had

R.L.M.

G

a large number of foreign princes educated and instructed with his own grandchildren. In this way, Agrippa, the grandson of Herod the Great, was educated with Tiberius' son Drusus, and his son Agrippa at the Court of Claudius. Marcus Aurelius grew up at Hadrian's Court. Claudius instituted the custom of his children sitting together at mealtimes with the sons and daughters of noblemen at the feet of their elders, so that a picture is presented of the children who were educated at Court. Such had been Titus, whose father, Vespasian, had risen to high rank under Claudius through the favour of Narcissus; he was the schoolmate of Britannicus, and learnt the same subjects under the same teachers; they were heart-whole friends, and Titus is said to have tasted the bowl that poisoned Britannicus. Often from these comradeships of youth life-long intimacies developed; out of Marcus Aurelius' most favoured friends, two senators and two knights had been fellow-pupils. An imperial freedman, Publius Aelius Epaphroditus, hygienic trainer of the 'aristocratic youth' (*pueri eminentes*), must have been one of the staff assigned to these Court-trained boys.

IV. THE EMPEROR'S TABLE COMPANIONS

The Emperors availed themselves of the counsel and support of their friends of both orders, principally in matters of business. Permanently or transiently they also summoned to Court a number of persons without regard to origin, for their social qualities and talents, their learning or culture, such as philosophers, erudites, poets, artists, according to the tastes of the reigning sovereign, as well as more or less professional jesters. These imperial companions (*convictores, συμβιωται*, friends only in a less technical sense) were often foreigners, especially Greeks; to this class belonged, for the most part, the physicians, astrologers and tutors already mentioned. Generally they were paid: Lucian says one of the philosophers, then in greatest repute, accepted a salary for giving the Emperor his society, and had to pay for it, by being obliged, despite his years, to accompany him on his journeys, like an Indian or Scythian slave. Perhaps the model for the Roman Court had been that of the Diadochi, at which philosophers were regularly maintained.

At the Court of Augustus, amongst other Greeks, the philosopher Didymus Areus of Alexandria, an Eclectic, was the most in

favour: he was the intimate and constant comrade of the Emperor, and his petition after the Battle of Actium secured the forgiveness of the Alexandrians. Seneca calls him, as against Augustus' consort, the continual companion of her husband, 'to whom all these secret emotion of your hearts is known'. He is said to have decided Augustus on the murder of Caesario, the son of Caesar and Cleopatra. The sons of Areus, Dionysius and Nicanor also stayed on in a similar position at the Court; Augustus employed them to extend his knowledge of Greek literature; Nicanor is perhaps the man glorified in a contemporary inscription at Athens, as being approved as a new Homer and Themistocles by the people, the Areopagus and the Six Hundred, for redeeming the island of Salamis, pledged in some hour of need, and for being an epic poet. Areus introduced Xenarchus, a peripatetic of Seleucia in Cilicia, and he, too, retained an honourable position all his life. And Athenodorus of Tarsus, the Stoic, who had been Augustus' teacher in Apollonia, spent some time at his imperial pupil's Court, Augustus wishing to testify his faithfulness, and only acceding to his desire to return home on condition of one year's postponement. There was also Nicolaus of Damascus, a learned and intellectual Aristotelian (a many-sided and prolific writer and poet, the author of a drama in Greek on the modest Susanna), who was often at the Roman Court on the business of King Herod the Great, and who was said to have been the teacher of Antony and Cleopatra. He, too, was high in Augustus' favour. Timagenes of Alexandria, the historian, had been brought to Rome in 55 B.C. as a prisoner of war. Seneca the Elder calls him 'happy save for the Emperor's favour', for his unrestrained wit jested Augustus' friendliness away. At feasts and on his walks he gave his humour full scope, directing it against the Emperor and his consort; Augustus at last forbade him his palace, and Asinius Pollio opened his doors to him. A welcome guest of Augustus' was Tigellius, the singer, both for his mastery of his art and for his conversation; Caesar and Cleopatra had liked him for the same reasons, and his artist's capriciousness was tolerated. Augustus also endeavoured to bring Horace into his circle, but in vain. When Horace refused the post of a secretary, he did not take it ill, but still went on pressing his friendship on him. He wrote to him in these terms: 'use me, as though you sat at my table (*convictor*), which

is what I wished for, as far as your health permitted'—'if you haughtily reject my friendship, I will not pay it back to you in the same coin'.

Tiberius, a man of wide and thorough culture, had a circle of Greeks before his accession, who after that event, shared in the largess distributed amongst all his friends, they receiving 200,000 sesterces each. They remained at his Court, and were asked their opinions; as, for example, when Thamus, an Egyptian steersman, was summoned before him, and reported how the news of the death of Pan had been announced by his fellow-daemons' loud lamentations. Tiberius let these erudites accompany him to Capri, to distract his mind with their converse. One of them was Thrasyllus, the astrologer, who has been already mentioned, and Charicles, the physician, whose advice Tiberius followed, though he was not officially appointed. Charicles, shortly before the Emperor's death, took his hand, as though to kiss it and say farewell, and at the same time felt his pulse. Tiberius noticed this, and, to conceal his weakness, lingered at table, 'seeming to do his parting friend honour'. But Tiberius, who was learned in both languages, found the most pleasure in philologists, whom he loved twitting at table with difficult or unanswerable problems; their learning used to be thus tested, half seriously, half in jest: he would ask, Who was Hecuba's mother; what was Achilles' name as a girl amongst the daughters of Lycomedes; the tune to which the Sirens sang? But these spiteful jests often were terribly earnest. One day he found out that Seleucus, the philologist, had been inquiring of the domestics what Tiberius had been reading, in order to prepare answers in advance: Tiberius first banished him from the palace, and then forced him to commit suicide. Nero's favourites were versifiers, who had to eke out his poetical efforts: he also used, says Tacitus, to indulge philosophers after dinner, in order to set rival principles wagging, and some were found who combined with ascetic manners and pronouncements an inclination to be the monarch's fools. Dio of Prusa was especially honoured by Trajan, and constantly seen in the Emperor's carriage. Hadrian assiduously cultivated a large circle of philosophers, philologists, orators, musicians, painters, mathematicians and astrologers, amongst whom Favorinus of Arelate was pre-eminent. The great Greek philologist Aelius Herodianus, who, for the depth and breadth

of his studies, has been compared with Jacob Grimm, was a friend of Marcus Aurelius, and wrote his theory of accents at the Emperor's orders.

Other entertainers of the Emperor were wittlings, jesters, harlequins and figure-models, who often had to sacrifice their person to amuse. Juvenal says, that a man wishing to live a parasitical life at Court, must endure more than Sarmentus, or the contemptible Gabba at Augustus' table. Sarmentus had been a slave or freedman of Marcus Favonius, who was killed at Philippi. He was of Etruscan extraction, and his beauty and his wit had endeared him at Court. Gabba, according to Plutarch, used to close his eyes at table, so as not to see Maecenas ogling his wife. When a slave attempted to filch his wine, he remarked : ' I am only asleep as far as Maecenas is concerned '. This anecdote is found in Lucilius as well. Martial praises Gabba's wit, but adds, elsewhere, should he, so happy in his patron, return from Elysium, and have a bout of jests with Capitolinus, he would be cried down for boorishness. Capitolinus must have been one of Trajan's fools. Plutarch mentions another of the sort, Battus, and says that Trajan's rough soldier's disposition found the jests of fools more entertaining than nobler converse. Claudius, when living a musty life of retirement under Tiberius, ' cheered his idleness with the society of jesters ' : one of these, Julius Paelignus, as loathly in body and weak of mind as his master, yet his especial favourite, was given, after Claudius' accession, the procuratorship of Cappadocia. At the Court of Nero Vatinius obtained a rank quite befitting the spirit that there reigned. He had grown up in a shoemaker's booth at Beneventum, ungainly of form, and a farcical jester ; as a mockery he was brought to Court. His servility endeared him to Nero ; his imputations and slanders of honest men brought him so great influence, that his power and property and harmfulness outdid the most evil at this Court, and ranked him with the most relentless and terrible of Nero's freedmen. Commodus, too, had also enriched some uncleanly jesters with frightful faces and horrible names and ghastly duties in return for their shameless impudence ; their names have come down, as Pertinax published them and the amount of their property.

V. THE CEREMONIALS

§ I. THE MORNING RECEPTIONS

One of the friends' privileges, though perhaps attaching only to those of the first class, was to wait on the Emperor in the morning. Fabius Maximus learnt of his disfavour by Augustus' answering his usual morning salutation of 'Hail, Caesar' with 'Farewell, Fabius'. Pliny the Elder, a friend of Vespasian, regularly visited him before daybreak, at which hour Vespasian gave audiences. This right was also a duty, and, if neglected, save on the most urgent grounds, an occasion for severe punishment, although all the Emperors would not be equally stern. Fronto boasts of having the affection of his pupil Marcus the Caesar, though he 'neither paid his visits at dawn, nor daily waited on him'.

Often the senators would pay their suit to the Emperor in the morning, in body or singly, as to the first in their order. Such receptions would take place especially on occasions of festivities or congratulation. When Nero had a daughter by Poppaea in 63 A.D. at Antium, the whole Senate repaired thither, to wish him joy. Of them only Thræsea, the leader of the opposition, was not admitted; he bore this rebuff, which was a warning of his imminent fall, with unmoved fortitude. Augustus never suffered the Senate to wait on him on the day of session, but greeted them in the Curia, and made them keep their seats; and, in his latter days, forbade such attendances. Tiberius used to invite the Senate, at the beginning of his reign, to visit him in a body, so as not to have to face the crush alone. Sometimes, too, the wives and children of the senators would be presented; Augustus is said to have foretold to Galba, who was presented to him when a boy, his future eminence. Amongst those present at Claudius' reception, women, boys and girls are mentioned.

Occasionally the Emperors would receive not only the senators: knights and the third estate might even be admitted. At such functions petitions would be handed in, and the Emperors would be more or less gracious. Augustus once jestingly remarked of a hesitant claimant, 'that he looked as though he were offering a farthing-piece to an elephant'.

To induce Tiberius to leave Rome, Sejanus 'objurgated the importunity of the people and the multitude of the comers'. Nero, in the early years of his reign, was conspicuous for his memory in addressing men of all ranks by name. Vespasian was exceptionally affable. All day long the gate of his residence in the Sallustine Gardens Palace stood open; no one was refused, senator or plebeian. Alexander Severus would only admit respectable persons with good credentials, and proclaimed by a herald that no one guilty of any underhand dealing should greet the Emperor, on pain of death.

The general reception (*publica, promiscua salutatio*) usually, it seems, occurred on festival-days, including the day of accession. Fronto apologizes in a letter to Antoninus Pius for absence on one anniversary: he had had rheumatism. Especially festive was the reception on the first of January. The palace was decorated and the Emperor received and gave New Year's gifts in money or kind (*strenae, étrennes*); Nero was buried in the white carpets threaded with gold used at his last New Year's day. Augustus utilized the money in buying statues, which he distributed throughout the city. In his early years, Tiberius used to return every gift fourfold with his own hands; but, as he came to be pestered all through January with people who could not contrive to come on New Year's day, he ceased giving, and left Rome on every first of January, besides limiting the exchange of gifts to that day. Caligula declared his readiness to accept by an edict, in order to fill his exchequer, and himself took the gifts on the palace terrace, where a mixed throng of all sorts and condition were throwing them in a pile. Claudius, in another edict, prohibited this abuse; but its disappearance was never quite complete.

The Empresses but seldom gave receptions open to whole corporations and ranks at once. Only three, who took an active part in the government, or aimed at claiming a share in the sovereignty, are said to have done so. Livia, according to Dio, was raised above other women, after her son had attained supreme power; and, at all times, let the Senate wait on her, and any others who wished to be presented; and she had this publicly recorded. Agrippina, in the same authority, did as much: under Claudius she was present at the reception of embassies and at other government

functions ; she had a retinue of noble ladies, and asserted her pretensions even under Nero, who in 55 A.D. assigned another house to her, so that there might be an end of her morning-receptions. Julia Domna, the third, was entrusted by her son Caracalla with a part of the government during his absence, and 'publicly received the *optimates*'. At all times, most of the prominent men must necessarily have paid their respects to the Empresses, singly, and the women, beyond all doubt. Alexander Severus forbade women of evil fame to appear before his mother and his wife. Even in the time of Hieronymus there was a crush waiting on the Emperor's consort.

On reception days, in front of the palace, a crowd of men of every standing always assembled, waiting for the announcement that the Emperor would receive. Gellius tells of some conversations of learned friends, like Favorinus, Fronto, Sulpicius Apollinaris and others, during this wait. And on ordinary days the place would seldom be empty. Apollonius of Tyana, according to Philostratus, compares the bustle in front of the palace with the scurry in front of a public bath : some rushing in to do allegiance, others forcing their way out, like the jostling crowds of the bathed and the unbathed. Many were there, on business, or in employ : many, too, desirous of seeing the Emperor leave the Palatine and drive out, or of greeting or petitioning him ; some used to climb the Sacred Hill ten times a day to give others the idea of their having friends at Court.

The reception was in the early morning, the usual hour in Rome for visits. Many would arrive at early dawn. Vespasian, as has been said, would admit even before daybreak, and converse with them in bed, and whilst dressing. The spectacles also began very early ; and the Emperors, to save their subjects a long journey, would often stay overnight in some freedman's house near the theatre, or even for several nights before, or even, as Hadrian, on such days give no audiences.

In the palace there was always a whole cohort of Praetorians (1,000 men) on guard, clad in the *toga* or civil costume, and a sentry was generally placed at the entrance. At least, Dio mentions it as a surprising fact, that no sentry paced the open doors of Vespasian's palace, an example probably

imitated by some of the later Emperors, such as Nerva or Trajan. But when, on January 22, 205, Plautianus was summoned to the palace, to hear his sentence of death, 'the guards at the barrier' admitted him, but shut out his retinue. In the early years of Nero's rule, Agrippina had, besides a guard of Praetorians, a number of German mounted cavalry, for her especial service, as also other members of the Imperial House.

Sometimes, too, the visitors might have to undergo a search for concealed weapons. Augustus even had senators searched, when he purged the Senate and expelled a number of members. Claudius' nervousness brought this practice to its height. Only after many days, and with much trouble, was he persuaded to relax the rule for women, and young boys and girls, and to allow the suite and secretaries of those admitted to keep their style and quill cases. And in the year 47 a Roman knight was apprehended with a dagger on him. To such as were freely admitted, Claudius gave a gold ring bearing his image, an institution that gave rise to great abuses. Vespasian suspended the practice of searching even during the Civil War; Claudius' immediate successors seem to have maintained it. What the later Emperors did is not recorded; in Dio's time it had ceased.

Inside the palace one section of the imperial domestics was engaged in keeping order and announcing and introducing the visitors (*ab admissione, admissionales*). This duty must have required a large staff, in view of the continual embassies from the provinces: Philo mentions one Homilos, who introduced them, and through whom Caligula gave audience to his Jewish embassy; interpreters must also have been included in it. The difficulties incident to admission would have varied with the rulers. Pliny the Younger paints Trajan's receptions as utterly differing from those of Nerva, his predecessor. 'Here we have no bolts and bars, no ascending scale of rebuffs, no endless series of further locked doors after an endless series already passed. In front of you and behind you, dead quiet; and near by you most of all; so noiseless and kindly the proceedings, that the Emperor's palace is a model of peace and restraint to any little or poor home.' Even when oriental pomp was gaining the upper hand, Alexander Severus gave audiences like a mere

senator: the curtains of the imperial cabinet were drawn back; only the servants were present, who waited at the door: 'whilst formerly the Emperor could not be greeted, as he could not be seen'.

Both the Emperor and his visitors came in the *toga* to the reception; a custom observed down to the fourth century. One indication of the change to a military autocracy was seen, when Gallienus, inside the walls of Rome, gave audience, clad in his soldier's costume, or *chlamys*, with bejewelled buckles. Marcus Aurelius and Alexander Severus wore the *toga* even in the other cities of Italy. The Emperor could scarcely appear even before his friends in his tunic, one of Antoninus Pius' greatest breaches of convention. Yet Marcus Aurelius had been taught by Junius Rusticus 'not to go about indoors in the *toga*, or do similar unbecoming acts'. Nero outraged custom by receiving the senators in a flowery tunic and a muslin scarf: for, says Dio, in such matters even, he violated the decencies of life by publicly appearing in an ungirdled tunic. Commodus received the Senate in a tunic of white silk and gold threads with sleeves. Caracalla spread the use of his favourite dress, a long Celtic tunic, whence he derived his nickname, amongst the people, and made them come before him in this garb. Macrinus proposed making a similar propitiatory gift in his son's name.

In Republican days friends of the first class were received singly: how far this obtained during the Empire we do not know. On occasion, apparently, single audiences were abused for the spreading of false reports; hence Alexander Severus would receive no one except his praefect Ulpian without witnesses, and the other friends only in assembly.

Friends, at least those of the first order, were kissed by the Emperor; thus Otho received the 'usual' embrace on the morning of Galba's last day on earth. This fashion came in under Augustus, and was restricted to the *optimates*. For, we are told, in the middle of Tiberius' reign, an infectious facial disorder broke out in Rome, attacking, so Pliny says, neither women nor slaves, neither the middle nor the lower classes, but only the *proceres*, who spread the disease by kisses. Tiberius, too, fell a victim. Even in Galen's day, there existed 'Tiberius' Anti-Scab Pastils': Tacitus specifies, as one of his motives for leaving Rome, his facial disfigurement with

ulcers and plasters : a consequence, perhaps, of this disease, which was treated with caustics that left scars, according to Pliny, uglier than the disease itself. Whether the edict of Tiberius, prohibiting the 'daily kiss' at Court receptions, was occasioned by this outbreak, remains uncertain. The manner of Valerius Maximus' justification of the Emperor's proceeding proves its unpopularity. 'The kings of Numidia are not to be blamed for following their people's example and never kissing. For the practices of the highly placed must be exempt from the imitation of the mob, to preserve due reverence.' From the aristocracy kissing spread down into the lower classes. In Domitian's time, or perhaps earlier, it was universal, and Martial is always voicing a complaint that in Rome kisses seem inevitable.

Possibly the grandees of Rome derived this utterly new custom from the East. At the Court of Persia, kinsmen were privileged to kiss the King, and Alexander took over many institutions of the Persian Court, amongst them the right of kissing the King as an honour ; the Seleucids and Ptolemies carried the practice on. Under Caligula 'the barbaric custom of prostration was introduced, and this last assault made on the spirit of Roman freedom', and thus such milder imitations of oriental forms can hardly surprise us, when they were not in direct opposition to Roman manners. The father of the Emperor Vitellius prayed to Caligula on his return from Syria, as to a god, with veiled head, throwing himself on the ground. Caligula, 'a being to orientalize a free state into Persian thralldom', made Pompeius Pennus, the old consular, kiss his gilded left pearl-slipper, in return for the gift of his life. This reverence was accorded to him by others of their free will ; as, for instance, by Pomponius Secundus the Consul shortly before he was murdered ; and the fact that prostration had become common is evident from Claudius' prohibition of it. Domitian demanded unmanly reverences ; for Pliny praises Trajan for not requiring his fellow-citizens to embrace his knees, and not returning their kiss with his hand. The jurist Publius Juventius Celsus was accused in 95 of conspiracy against Domitian, and, in the secret audience he asked for, adored him as Lord and God. Yet Domitian cannot have gone as far as Caligula. Epictetus says he would regard compulsion to kiss the Emperor's feet

as direct tyranny. Elagabalus again required the adoration of a Persian king, a custom abolished by Alexander Severus. Later on cringing reverence gained more and more vogue, and, in the last days of the Empire, the imperial kiss was a high honour seldom awarded.

Senators, as the Emperor's peers, also could claim the honour of the imperial kiss. Pliny thus describes Trajan's entry into Rome as Emperor : ' Every one was glad that you greeted the Senate with a kiss as you had left them ; and acknowledged the foremost of the knights with a personal address, with no one to prompt you, and that you greeted your clients almost first of all, and added signs of confidence '. Presumably, these differences of greeting obtained also at the Court receptions ; except in so far as knights who held the highest offices, or were made friends, enjoyed the same honour as the senators. Tiberius' formal prohibition of the custom has been mentioned. Caligula 'kissed very few. To most, even the senators, he gave his hand or foot to kiss. And therefore those he kissed thanked him publicly in the Senate, though they saw him kissing pantomimes every day'. Nero manifested his hatred of the Senate in that on the day of his return from Greece, and also when setting out, he refused to kiss or return their salutations. Such breaches of custom were the more offensive, the more insignificant the honour became, and the more commonly it was bestowed on senators. Agricola, on his return from Britain, was received with designed coldness, yet Domitian, despite his monarchical haughtiness, which Pliny censures, embraced him, though he did not allow him to converse. Embraces were, no doubt, bestowed according to individual standing. Marcus Aurelius testified his regard for his intimate friend Junius Rusticus, whom he twice made consul, by kissing him before the praefect of the Praetorium, who had the first claim ; Julianus, who held this praefecture under Commodus, and was murdered by him, was often publicly embraced by him and called *Parens*. Further, no doubt, it was physically impossible to deal this honour out to all those present at a reception. Fronto tells how his imperial pupil, Lucius Verus, admitted him first into his bedroom, to be able to 'kiss him uninviciously', and, characteristically enough, expatiates, how he, to whom the Emperor had entrusted mouth and speech to educate, had a peculiar

claim to his kiss ; kisses he esteemed an honour due from mankind to eloquence.

As a rule, the Emperors would show the greatest politeness to the first order in the State at public receptions : and any designed disrespect to them would be the more keenly felt. If Caesar received the whole Senate, offering him decrees of honour, seated, it would be taken as a discourtesy and returned with loathing : it had been a primitive right of the Senate to remain sitting round the magistrate, whilst the other citizens stood up. Augustus was courtesy itself, and Tiberius adulation even ; the only Emperors in the two first centuries whose behaviour showed ill-will towards the Senate were Caligula and Nero, perhaps also Domitian and Commodus. According to Pliny, at Domitian's receptions, there was an air of hesitation, as though one were running a mortal danger ; the salutations done with, all was flight and solitude ; terror and menace hung about the gateway, affected the admitted no less than the excluded. The Emperor had a terrifying aspect, and none dared meet him or approach him. But Trajan received all affably : waited for them, devoted much of his busy day to conversation with them ; his visitors arrived untroubled, merry and at their own pleasure ; or, if detained at home, an apology was hardly needed. This condescension made the functions much longer ; Antoninus Pius in his later years used to fortify himself with a crust. Pertinax was 'courteous to all his visitors and interlocutors'. Alexander Severus made the Senate remain seated at receptions. But Caracalla, at his winter quarters in Nicomedia, would let them wait one whole day in front of the palace, and then not receive. Dio considered Elagabalus indecent in his receiving the senators in bed.

§ 2. THE PUBLIC MEALS

Besides the public audiences, the Emperors also instituted frequent public banquets (*convivia publica*), open to large numbers. Claudius was the first to have a guard set at them, a custom continued down to Alexander Severus' day. A knight Pastor, whose son Caligula had executed, was soon after invited to a public banquet and 'lay there as the hundredth guest'. Claudius loved these huge dinners,

at which never more than six hundred were assembled. Alexander Severus disliked them, as resembling eating in the Circus or theatre. To these functions the third estate would be invited, besides the senators and the knights. Augustus used to select among ranks and persons with the utmost care, and never asked a freedman to his table, except Menas, and him only after the rights of freebirth (*ingenuitas*) had been conferred. He wrote that he once asked a man in whose country house he once stayed, a former orderly. The exclusion of freedmen by Augustus points to laxer indulgence by the later Emperors to a class that was ever rising in power and esteem.

Further, the senators did not always sit with the knights at the Emperor's board, but often by themselves. Otho, in the first days of his reign, dined eighty senators, some with their wives together. And, generally, senators' wives often apparently took part at these banquets. Caligula used to invite the noblest even without their husbands, and send those who suited him letters of divorce in the absent husbands' name. Claudius at table once asked Publius Scipio why his wife Poppaea Sabina, the mother of Nero's consort, was not there; she was in prison and, at Messalina's instigation, driven to suicide. Pertinax, on the day of his accession, invited the principal men of the Senate (*proceres*) and the magistrates to table, a custom (*consuetudo*) disused by Commodus. At these dinners, too, the Emperors would be very courteous to the Senate and the consuls especially. When Tiberius received them, he would welcome them at the door, and personally see them out. Hadrian, too, received them standing up. Tiberius, on dismissing his guests, would stand in the middle of the *triclinium* with a *lictor* beside him, and bid each farewell separately.

An invitation to the imperial board was an honour even to the highest placed. Tiberius, who loved lulling his victims' suspicions, raised Drusus Libo to the praetorship, after deciding on his death, and repeatedly asked him to dine. Vespasian, as has been said, publicly thanked Caligula for the honour before the assembled Senate, but showed himself manifestly and extravagantly servile. Martial declares, were he to receive simultaneous invitations from Domitian and Jupiter, he would not waver one minute, even were the

mount of Olympus nearer than the Palatine. The poetical fame of Statius, who had been crowned at the feast of Minerva, ensured him his invitation, and he vented his gratitude at his first 'Holy Banquet' in a long flowery poem. He believed he had been sipping nectar with Jupiter; that this day was his real day of birth, the threshold of his existence. He could scarcely realize that he had been privileged to behold, whilst at his cup of wine, the Emperor's face, and to sit at the same table. Caligula was apprised that a rich provincial had bribed the slaves who carried the invitations with 200,000 sesterces, so as to secure a place: and, so far from being angry at the high price the seat fetched, made him next day buy some trifle at an auction at the same figure, with the message that that day he should dine with the Emperor at the Emperor's own invitation. Sometimes at these mixed assemblies untoward incidents would occur. At a banquet of Claudius, a guest of Praetorian rank, Titus Vinus (who attained great influence under Galba) was suspected of stealing a golden cup: he was asked next day and given an earthenware one.

Every emperor behaved differently to his guests. Augustus used to display the greatest courtesy, move them to conversation if they whispered or were silent, and provided distractions in the shape of lectures, dances and jugglers: he would come in late and leave early, but never allow the guests to be disturbed. Titus' banquets, too, were social and not extravagant. Of Domitian's there are two opposite delineations; one of Statius, already mentioned, who seems intoxicated at the honour, and one of the Younger Pliny, who makes fun of the haughty treatment of the senator. Statius paints the gorgeousness of countless rooms of costly marble, the immensity of the halls, the ceilings too high for the eye to reach, the gilded wainscoting: at which the Emperor seated the senators and knights at many tables. But for the rich meal, the citron-wood tables with ivory feet, the army of servants—for these he has no time: Him, Him only he gazed at, kindly mitigating the radiance of his majesty. And so on. Pliny draws a different picture of Domitian gormandizing alone before midday, and sitting among his guests as spectator, showing every sign of satedness; he had the dishes thrown rather than placed in front of them; with a forced semblance

he got through a common meal with them, and then retired to his private carouses. But Trajan's feasts were noticeable more for his friendly amiability than for the ostentation of gold and silver and delicate cookery : at his table no perversions of oriental superstition, no obscene licence, only a kindly exhortation, decent jokes and the honour due to knowledge. He delighted in common meals, engaged all in conversation, and what his affability prolonged, his moderation shortened. (Actually, this was not one of Trajan's virtues : he was a hardened toper.) When Pliny and others were summoned to the imperial council at Centumcellae, Trajan invited them every day to a dinner which was simple for a prince. Sometimes music might be performed, sometimes the night was passed in agreeable conversation. And gifts were made at the parting. At Domitian's table the guests had been liable to unfriendly or even ignominious treatment. Once he invited the first among the senators and knights to a banquet, where the hall was draped in black, the servants like black spectres, the courses served in funeral black dishes, and by every guest his name inscribed on a tablet lit by a hearse-candle. And after the guests went back home in alarmed expectancy of a sentence of death, they were given precious gifts. Elagabalus used to lock his friends up, when they were drunk, and send among them wild beasts, who had had their teeth drawn : many died of fright ; less noble friends he would seat on air-cushions and have them pricked.

The fare provided by Augustus was very simple ; three courses or six at the most ; Tiberius, desirous of inculcating parsimony, made them almost stingy ; but the economical Vespasian gave costly dinners, so as to create a demand for the sellers of food, whilst making his own meals scant and severe. Pertinax, in some measure, diminished the enormous wastefulness of Commodus' banquets. Alexander Severus, at all meals, great or little, observed the same simplicity. The general Roman custom of serving guests according to their rank did not apparently obtain at the imperial table, as Hadrian, to foil the embezzlements of his culinary officers, ordered the dishes served up at the last of the tables to be given to him.

The imperial table scarcely excelled private banquets in respect of the fare, but in the dishes, the state and the service, a difference that scarce can have arisen before the end

of the first century, and varying at various times. Information is scant and incidental. Caligula, Nerva, Trajan, Antoninus Pius, Pertinax and Marcus Aurelius (to cover the cost of the war with the Marcomanni), all held great auctions of the imperial valuables, such as golden, crystal and myrrhine cups. Later on, Marcus Aurelius allowed the purchasers to return the articles at the same price, not, however, forbidding them, and the *proceres* especially, to dine in the same state linen, and with the same plate as he, and to use golden antimacassars on the dining sofas: the first subject to avail himself of this permission is said to have been Elagabalus. Hadrian was the first to cover the tables with golden or embroidered coverlets; Elagabalus imitated him and had the coming dishes worked in as their design. Alexander Severus would have only simpler ones with scarlet stripes. Gallienus had them threaded with gold. The use of gold plate at table was an imperial privilege, reserved to private persons by Tiberius in the year 16 for sacrifices. Aurelian expressly granted such a licence.¹

The guests, as at the morning receptions, used to appear in the *toga*, at any rate up to the reign of Marcus Aurelius, whose guest, Septimius Severus, came in the *pallium*. A *toga* of the Emperor's was given to him; this was taken as a foretoken of his accession. But, probably, the use of the Roman state-costume lingered on to late times. Senators and knights wore their purple stripe on the tunic, and magistrates their *insignia* of office. In the year 70 a banquet of Otho was interrupted by military uproar, and the magistrates cast aside their robes, so as to escape unnoticed. During the banquet, the *toga* probably was allowed to hang down from the shoulders, a manner attributed to Hadrian by his biographer. Soldiers never regularly came in uniform until the second half of the third century.

¹ In dress, too, in course of time, the imperial servants became distinguished. Domitian, as a prince, was angry at his brother's son-in-law clothing his servants in white, and quoted in disapproval: οὐκ ἀγαθὸν πολυκοιρανίῃ ἐς κοίρανός εἶναι; which is mentioned as an instance of his uncivil haughtiness. Marcus Aurelius had learnt from his father that one could live at Court without life-guards and special garb, or indeed any pomp. But this *étiquette* came in later. Aurelian is said, when emperor, not to have altered his slaves' costume. Gold seems to have marked Court dress; Alexander Severus, who aimed at simplicity, would not let his servants, even at public meals, appear in gold, or have any gold at table. As late as about 350, tunics stitched in gold were part of the special costume of imperial servants.

CHAPTER III

THE THREE ESTATES

I. RANK AND BIRTHRIGHTS

ANCIENT Rome made between citizens, freedmen and strangers, a stern division, which the evolution of the Republic had already weakened and destroyed. The more universal her Empire became, the more did foreign elements stream in, first from Italy, and then from the provinces, and swamp the vanishing descendants of her original founders: aliens and their children, the posterity of freedmen, forced their way in even into the higher ranks and the highest offices. To this process of dissolution and admixture the levelling effect of absolute monarchy was added, in which all subjects were, to a certain extent, equalized. Yet, despite these tendencies, the consciousness of a better inborn right, which is felt by all privileged classes, might become less keen, but could never wholly die out; rather would it always renew and reshape itself. Ranks, classes, nationalities were no longer segregated in the same way; the transitions from one sphere to another were from time to time variously bridged over, and constantly alleviated; but it followed necessarily that all new-comers into a higher community would soon share the feelings of elevation with their new peers, and of a superiority to the class out of which they had emerged. Thus, despite the reversal of the old institutions, the old differences, in some measure, still subsisted; rather did the monarchy renovate and increase them. Such was the new regulation of names in the Empire. Very probably Augustus even issued distinct directions in this matter, and established clear verbal differences between the free and the freed. Henceforth an ordinary slave would have one name, a State or imperial two, and the freedmen three; but the name of the tribe,

together almost certainly with the franchise, was withdrawn from them, and reserved to the free-born, who might have four names or more.

Not only the freedmen, but their sons as well, as before, ranked below the free-born; their grandsons became equal. The promotion of their sons to the Senate and the magistracies was always esteemed an abuse; Claudius even admitted a freedman's son into the Curia only on condition of adoption by a knight: Nero excluded them altogether for a long time, and deprived those admitted by his predecessor of their offices. Tiberius in 23 A.D., by an Edict, formally declared the sons of freedmen inadmissible to knighthood, a rule often infringed by Augustus (one of his friends Vedius Pollio, the knight, was a freedman's son): in time exceptions multiplied and annulled the rule. But still freedmen's sons were rarely admitted to the highest offices, though instances had occurred in the later Republic and under Augustus. Of such descent had been the tribune, in 25 B.C., Gaius Thoranius, who made a good impression by allowing his father to sit beside him in his place of honour at the theatre. A few such attained the higher offices in the course of the first century. One Larcus Macedo, who, oblivious (according to Pliny) of his servile descent, treated his slaves cruelly and haughtily, was praetor, some year before 101 A.D. But, even at the close of the second century, no sneers were spared at his humble origin, for 'war always brought such scum to the top', when Pertinax, a freedman's son, reached the consulship for his military services.

Freedmen might gain repute through individual pre-eminence in rank or wealth, but never could attain social equality with the free-born. The free-born man, for all his humble bows and cringing flatteries, never lost his sense of superiority: 'on your birthday', so Martial addresses a rich freedman, 'the Senator and Knighthood may dine with you, but not one of them, Diodorus, asks whether you still are alive'. Only good looks, he says elsewhere, could make a freedwoman preferable to a free-born maiden, or a slave to a freedwoman. Yet then, socially, freedmen had unquestionably advanced since the day of Augustus: Court *étiquette* in the first century precluded them from the imperial board, and Horace might be stigmatized as a 'freedman's

son', despite the broadmindedness of Maecenas who declared the irrelevance of the father's standing to one of Nature's gentle-born.

Somewhat higher in the scale of disdain did Rome place the conquered provincials. The provincial was brought to the Roman slave market, sold, and manumitted, and in his new-born citizenship of Rome deemed himself above his 'tribute-paying' fellow-countrymen, who were liable to poll-taxes, in ancient times a badge of servitude, as well as those assessed on their property. The lower estimation in which the provinces stood in comparison with Italy, is seen in Tacitus' remark that the praefect of Ravenna, Clodius Quirinalis, oppressed Italy with his harshness and lusts, 'as though he were in a mere subject land'. In his political will, Augustus directed a sparing use of the citizenship, so as to conserve the distinction of citizen and provincial. The *decuriae* (jury lists) were restricted to knights, and contained 3,000 names, 2,000 of whom had half of the wealth; and ordinary provincials were only admitted under Claudius, even then and later excluding 'new citizens'—i.e. by grant, not by birth—and the lists were prepared from amongst Italians by preference, and next out of Latin-speaking provinces. 'No Egyptian juries' runs a placard at Pompeii. Seneca, the Spaniard, exhibits the full Roman haughtiness in ridiculing Claudius, who squandered civic rights and the *toga* amongst Greeks, Gauls, Spaniards and Britons. The *Parcae* cut his life's thread short, just to preserve a few *peregrini*. When grants were made wholesale to corporations and classes, an individual bestowal became a distinction, rare, except under Claudius, and the more honourable.

Amongst provincials, the West was in greater repute than the East, where the utter diversity of race served to foster the prejudice. But the Gauls, Spaniards, and Africans, and other 'wild barbaric folks', were but slowly Romanized, and reluctantly and late accorded these rights. Cicero asperses with bitter words the credibility of the witnesses cited from Narbonese Gaul against Fonteius the Praetor, the principal of whom was Induciomarus, the chief of the Allobroges, as barbarians, whom no thought of the hallowedness of the oath, no religious fear could terrify from giving false testimony; were the jury to lend credit to such foes of Rome, rather

than to the Romans settled in that province? Caesar, when he invested some 'half-barbaric' Gauls with the *civitas* and brought them into the Senate, outraged public opinion, which shrank at the very thought of the influx of the 'transalpine, trousered' populations. A public request was issued not to show the new senators the way to the Curia, and on the streets the people sang :

Lately victims in his triumph, now they're for the Senate ripe ;
Lately wearing Gallic breeches, now they wear the purple stripe.

These Gallic senators were probably deposed by Augustus, yet, as early as 40 B.C., a foreigner, for the first time, became consul, though only to fill up a blank ; this was Cornelius Balbus, a Spaniard of Gades, whom astuteness and wealth had furthered in the Civil War ; the first, as Pliny the Elder says, of foreigners, born moreover at the pillar of the world, to have got the honour our forefathers denied to the inhabitants of Latium : and he was always scoffed at as the man of Gades, or the man of Tartessus, and ever denied admission to the Senate. His nephew, Balbus the Younger, also became consul after his victory over the Garamantes in 19 B.C., and built the third stone theatre in Rome. Narbonese Gaul was regarded more as a portion of Italy than as a province, and its inhabitants, even in the Early Empire, often attained senatorial office. Vienne, 'that great and brave colony', as Claudius calls it, was the first, and perhaps the only town, to send representatives to the Curia. Valerius Asiaticus, of Vienne, one of the greatest of his day, was twice consul, and resigned the office the second time (46 A.D.) in the vain hope of thus circumventing enmity and malice. Pompeius Vopiscus, of Vienne, had the consulate conferred on him by Otho in 69 A.D. Besides these Viennese, the names of senators from Nîmes (Nemausus), Forum Julii (Fréjus) and Tolosa (Toulouse) have come down. In the year 49 A.D. senators were allowed to visit their Narbonese estates without asking for furlough.

In the year 47 the chiefs of new Gaul began agitating for the senatorial offices ; they had been Romanized for one hundred years, and only Lugudunum (Lyons) had been favourably excepted. Yet strong opposition was offered. Italy,

it was objected, poverty-stricken as she was, could still provide a senate for her capital. Were not Veneti and Insubres admixture enough? What privilege would remain over for the scanty survivals of the nobility or poor senators of true Latin blood? The rich scions of the tribes vanquished a century ago would soon supplant their conquerors. Citizens they might become, but do not cheapen senatorial and magisterial dignities. It required the outspoken will of Claudius to stifle the protests. At Lyons, his native city, a bronze tablet still exists, containing a fragment of the learned speech he delivered on this occasion. Incontestably, he said, Italian senators were to have the preference over provincials, whose claims to a rank they might adorn must not be spurned. The Aedui (between the Saône and the Loire), first received the senatorial rights, and others perhaps individually in the remaining districts. The father of Gaius Julius Vindex, an Aquitanian 'of royal descent', was a Roman senator.

Other provincials can only have been in the Senate exceptionally, and grudgingly, as interlopers. Tacitus makes Seneca of Corduba in 63 send Nero a confession of his unworthiness, so as to disarm evil tongues: often, he says, he has weighed the question, how he, a knight and provincial, dare rank with the primates of the State; how he, with his mushroom growth, dare soar to a height with an aristocracy of ancient fame. After the decimations of the Civil War, Vespasian further restocked the benches of the Senate from the provinces, and ever found in them his best support. When Trajan, a Spaniard, ascended the throne, the voice of conservative Rome could no longer openly jeer at the Western lands. And under Trajan (in 115) Quintus Lusius Quietus, a Gaetulian sheikh, born not in Africa, the province, but near an obscure and distant frontier, became consul. He had distinguished himself in the Dacian and Parthian Wars as a cavalry leader. In the second century no few senators were African. Fronto (consul in 144) met many fellow-countrymen from Cirta (Constantine) in the Senate.

And then Greeks and Little-Asians could no longer be fairly excluded: the latter were held in scant respect, and had no part in the reverence paid to Greece, the mother of Roman culture. Phrygians, says Cicero, are the better for their weals; a Carian makes the best desperado; 'the last of

the Mysians' expressed supreme contempt; Greek comedy made its stock-slave a Lydian. Shall a man, Juvenal makes a born Roman exclaim, impress his seal in front of me, have a higher place at table, whom the same wind wafted to Rome with imported Damascene plums and Syrian figs? Is it for nothing our youth has been nurtured on Aventine air and Sabine fruit? And he, the son of an Aquitanian freedman, saw and despised the 'knights of Asia, Bithynia and Cappadocia, who had come to Rome as bare-footed slaves'. Martial, too, looked on it as the irony of fate, that a noble poet should starve, because he was not a 'burgess of Syria or Parthia, a knight from out of the Cappadocian slave-stands, but a mere native of the people of Remus and Numa'. Alexander Severus was ashamed of being a Syrian and fabricated himself a Roman family-tree.

From the Early Empire onwards, however, Greeks and Little-Asians took high rank in the Roman knighthood. Vedius Pollio, a rich knight and a friend of Augustus, came from Caesarea in Bithynia. Vespasian and Titus during their censorship (73 and 74) were the first to admit the most prominent of these settlers in larger numbers to the Senate. Tiberius Claudius Atticus, of Athens, in Nerva's reign became enormously rich through a treasure-trove, and was twice consul (the first time about 104); his son, the great sophist, Herodes Atticus, is recorded in the consular *fasti* of 143 A.D., and his grandson Tiberius Claudius Bradua Atticus in 185. In fact, in the first century, literary fame was a sure key to inspiring favour, as is shown by the many great Greek sophists and writers who became consuls. Scions of princely houses might also be thus distinguished, as, for example, under Trajan, the Commagenian Gaius Julius Antiochus Philopappus. The second and third century contain most of the inscriptions mentioning Greek and Little-Asian senators or consulars.

Few other Orientals entered the Senate before the third century. The consular Flavius Boethus, a zealous Aristotelian, and a friend of Galen, was born in Ptolemais in Phoenicia; but, after Caracalla and Elagabalus and Alexander Severus, their numbers increased. Such was Odeinathus, prince of Palmyra (died in 251), father of Odeinathus, the husband of Zenobia, and of Septimius Heyranus. He attained

consular rank. No Palestinian Jew is known to have reached Senatorial rank before the fourth century, when Hieronymus speaks of Jewish senators, though Josephus mentions some as being knights. The senatorial knight Tiberius Julius Alexander, was a nephew of Philo the philosopher. Philo, in Nero's last years, the governor of Judaea, was an Alexandrian renegade Jew 'of a rich and famous family, allied to Caesar, who had rendered distinguished service in the Parthian War on the general staff, a rank he also held in Titus' Jewish War': in the interval, he had been praefect of Egypt.

Dislike of the Egyptians was even stronger than hatred of the Jews. Only the citizenship of Alexandria might entitle them to that of Rome, nor often: seldom might they become knights: two hundred years of subjugation had to pass by ere Caracalla made the first Alexandrian, Coeranus, a senator and consul. Even in the fifth century did the rest of Egypt lack all right to senatorial office. Juvenal's spleen was aroused at the nationality of Crispinus the Egyptian, who became 'first of the knights', perhaps praefect of the Praetorium, and a Court-favourite.

In the later centuries, too, Romans naturally retained a preference over foreigners in the elections to the higher offices, as Dio testifies, when he makes Maecenas state it as the bed-rock of the imperial system that the curule offices and the consulate should be held by Romans. This rule was honoured, even in the breach. Pescennius Niger, one of the rival Emperors of Septimius Severus, said he intended to govern Rome by Romans. Rome's disdain of strangers, her contempt of everything extra-mural, lasted to the end, and then even the mob made the theatre resound with its loud bigotry.

The Italian, the Latian even, was deemed but somewhat better than the provincial; as a senator he was an upstart, and his children were not easily forgiven for their ancestry. Antony, the aristocrat, reproached Octavian for his mother being born at Aricinum. 'One might take it', says Cicero, 'he was talking of a woman of Ephesus or Tralles. You see how we are prized, we who come from the *municipia*. And yet how many of us do not?' And he had blue blood often enough dinned in his ears. Catilina dubbed him 'an import'. But Tiberius, as Claudius says in his address,

incorporated the flower of Italy's *municipia* and *colonias* into the Senate. But whilst revolutions might destroy, society be transformed, this disdain was ever there, deep-rooted in the nation's soul. One hundred years later Tacitus found Rome no less uplifted over the cities of Italy than in Cicero's time, despite that the Flavians of Reate had held the sceptre, and Nerva the Narnian, and Trajan the Spaniard. And his views are the more striking, as he can scarce have been more than a knight. He accompanies the tale of the adultery of Livia, the wife of Drusus, with Sejanus, a knight from Volsinii, with the remark : ' She, Augustus' niece, Tiberius' daughter-in-law, Drusus' wife, shamed herself and her lineage with adultery with a mere municipal ! ' The second marriage of Julia, the granddaughter of Tiberius, with Rubellius Blandus, he considered an utter degradation for a princess, for many still remembered her husband's grandfather, a knight from Tibur, though Rubellius Blandus had been consul. Suetonius tells of how Caligula, in a letter to the Senate, impugned the descent of his great-grandmother Livia Augusta, as her maternal grandfather had been a councillor at Fundi. Suetonius defends her against this imputation, as Aufidius Lurco undeniably held high office at Rome. One hundred years later, Marcus Aurelius espoused his daughter Lucilla to Claudius Pompeianus, the son of a Roman knight of an obscure family at Antioch ; but this need not be ascribed to a change of social view, but to the philosophic breadth and rare unprejudice of that Emperor : he selected his sons-in-law not from the first men in the Senate, but according to individual capacity. Further, neither Lucilla nor her mother Faustina were satisfied at the match, not merely since the bridegroom was no longer young.

These facts serve to illustrate the feelings of rank between the senators and the knights : but the division between the two classes did not cover that between Romans and municipals. Knights are celebrated on their monuments by their clients or themselves, as ' a senator's father ', a ' senator's grandfather '. A quarrel once arose between a knight and a senator, and Vespasian's ruling was that senators might not be insulted, but their insults might be met, a decision, according to Suetonius, that the dignity rather than the legal standings differed. Martial describes the first two estates

as the 'Knights and Lords Senators'. The terms of senatorial titles will be later on dealt with.

In criminal law both orders were privileged, as were also soldiers, veterans, town councillors in imperial cities, and so sharp was the distinction that a man of rank might be degraded to a plebeian. They might not be flogged, tortured in evidence, pressed for labour and mines, crucified or thrown to gladiators or animals in the Circus. An insult from a plebeian to a senator or knight was severely punished. In social intercourse the gap between the knighthood and the lower middle-class was great, and a chasm existed between the first and third classes: the following fact is illustrative. A senator of praetorian rank was, under Domitian, accused of a somewhat dubious transaction, and chose voluntary banishment rather than certain condemnation, and, to maintain himself in Sicily, had to teach oratory. On entering the lecture-room one day, he began declaiming, 'O Fortune, thou raisest the meek and humblest the strong! Thou makest professors into senators, and senators into professors'. Pliny the Younger says this sentence was so full of bitterness and gall, that he believed he became professor, just to be able to say it. And identically with Pliny the Senator, Juvenal the Knight made out the contrast of the two classes as extreme. 'If thou, Fortune, wiltst, thou makest a rhetor a consul, or a consul a rhetor.'

II. THE SENATORS

The Empire was accepted either of the troops or the Senate; in either, legitimation came from the Senate, which also might depose, as often happened. To the Senate, the Emperors were only *primi inter pares*, and fellow-senators; except Caligula, Nero, Domitian and Commodus, they all endeavoured during the first two centuries more or less to maintain this relation. Herodian cites an apologetic letter of Opellius Macrinus (217) on his election, begging no repugnance may be felt at his having been a mere knight, for nobility was nothing without excellence; and the blue blood of Commodus had benefited the Senate as little as the lawfulness of Caracalla. Emperors of high descent were more violent rulers than humbler men. Those who received the Empire

from the Senate, regarded themselves as its debtors, and sought to acknowledge its favour by their acts.

Augustus was the first to establish a legal senatorial caste and hereditary peerdom, by restricting competition for curule office and the consequent seat in the Senate to the nobility or families, whose ancestors had held such offices. Those not born into this order might be admitted in two ways, the granting of senatorial rank to young men, or the exceptional creation of senators of one of the three subclasses (*adlectio*): both forms were used by the Emperors, and when the censorship fused in the general imperial authority, new creations were in the ordinary prerogative. Such ranks were hereditary, tenable even by the wives, and the agnate line to the third degree.

The ancient senatorial families must have been very few at the dawn of the Empire; extinction (as with the Atilii, Metelli, Curii, Fulvii), outlawry and death in the Civil Wars—the triumphs proscribed either 130, or 300 senators and 2,000 knights—disappearance in the Early Empire, as with the Aemilii Scauri, or penury, with the Hortensii, all were active causes, losing them their family rights and submerging them utterly. These gaps were filled up, as set out. The seedhouse of the Senate was the knighthood of Rome and her colonies and towns, and her provinces, whence ‘new men’ found their way up into the Senate, in virtue of birth, wealth or merit. Rutilius Gallicus, who, according to Statius, did long service in the field under Nero, attained the consulate, under Domitian became City Praefect, and gave his family a lineage of nobility. He must have been of knightly descent, despite the elevation of his father into the Senate. The knights who were not senators had no hard and fast means of ennoblement. Practically, at least later, the command of the Guard conferred, on retirement, a claim to a seat in the Senate, in some measure an honourable dismissal.

And men of the third estate, even at the beginning of the Empire, could rise through fortune, merit or favour to the first. During the Civil War, Octavian raised Salvidienus Rufus, a man of no family, nor even a senator, to the consulship. Talent and his friends helped Curtius Rufus, a man so humble as to be called a gladiator’s son, to the quaestorship: subserviency towards his superiors, and truculence to

his underlings, enabled him to gain the consulate, and pro-consulate of Africa. Tiberius, who gave the praetorship to him rather than to his noble competitors, excused his smirched birth, by saying, 'he seems to me a man self-born'. And many other such 'self-made' men owed their eminence to the readiness in fulfilling the imperial will, especially as informers in cases of high treason. Through the favour of Sejanus, Junius Otho, originally a teacher of oratory, was appointed senator, and his unscrupulous zeal carried him through to the praetorship; and the same influence raised both Eprius Marcellus and Vibius Crispus from the depths of poverty to high rank, vast wealth and great power, gained by unconscientious use of their extraordinary ability. Military service could win the low-born a seat in the Senate. According to Dio, Maecenas advised the admission of the most distinguished officers, though they had begun as centurions: but a mere soldier of the rank and file, a mere hewer of wood and drawer of water, should never become senator. Thus careers like that of Oclatinus Adventus must have been very rare: he had begun as a common soldier (even a hangman's assistant, according to Dio); without a tincture of culture, rose up to the Praefecture of the Praetorium; Macrinus made him City Praefect: in 218 he resigned this post to become consul. The first known senators who commenced life as centurions, are the Emperor Pertinax, and Pescennius Niger, the rival of Alexander Severus.

It is hardly credible that freedmen should have been admissible to the Senate before the time of Commodus, whilst forbidden access to the first rank in all the *municipia* and colonies: Cleander, the favourite of Commodus, was the first to make freedmen senators and patricians. Under Caracalla the deposition of a former slave, Marcius Agrippa, who had once been the hair-curler of his mistress, from a high knightly post to a senatorship and praetorship was a kind of degradation. Elagabalus used to make 'freedmen into governors, legates, consuls and generals'. Alexander Severus was proportionately stricter, and would not even make them knights.

Even the early Emperors, as has been said, admitted the sons of freedmen; their more distant descendants encountered less difficulty. Even in the middle of the first century

many senatorial families were thus descended. It was said the Vitellii came of a freedman cobbler ; his son made a fortune by investment in building-lots and State agencies ; he married a baker's daughter, who bore him the first member of the family, who became a knight, and then imperial financial councillor : his four sons were senators : one of them was three times consul and censor, and was the father of the Emperor Vitellius. Tiberius' famous teacher of rhetoric¹ was of servile descent ; his son was, under Hadrian, a senator. Claudius, who was by no means exclusive, conferred the purple stripe on a freedman's son, only on condition of his being adopted by a knight ; and similar ceremonies may have been the rule. Nero would not accept any freedmen's sons, and deprived those admitted by former Emperors of their offices. Later on, they may have held them, if only under the cover of friendly aristocratic competitors. Even Valentinian, Valens and Gratianus had to issue rescripts, declaratory that freedmen's sons should not be excluded from the rank of *clarissimi*.

The upstarts and new men in the Senate became more and more, and the ancient nobility continuously died out ; Juvenal refers to the fusion of the nobility, and Apuleius, in 166, to the fewness of the old stock : but the old families became all the prouder of their genealogies, and were looked upon with ever-increasing respect. The hall-mark of the aristocracy was the right of setting up ancestral pictures in the *atrium*. Reverently did a stranger betread houses in which fading paintings of triumphing generals in the four-horsed chariots covered the walls, and smoked masks of the ancestors filled the *atrium*, their names, their honour and their deeds inscribed below. 'Ancestral pictures and inscriptions' were popularly admired, as in the time of Horace. The Middle Ages, the modern epoch and ancient Rome were at one in loving 'great lords who bore great names worthily', and they were proud to share in the radiance of their native aristocracy. Juvenal's rhymed platitudes on the true merit that lies in virtue and not in blood, provide a needless reminder of the generality of the opinion he was combating. How highly they were esteemed by the people is shown by Tacitus' account of the trial of Aemilia Lepida in the year 20. Her late husband, Publius Sulpicius Quirinius, was

¹ Theodorus of Gadara.

accusing her of introducing a changeling and other serious offences. Despite her evil repute and her guilt, the splendour of her descent from the Aemilii and Sulla and Pompey won her the general sympathy. When she, with a retinue of noble ladies, prayed her ancestors for protection in the theatre of Pompey, the people burst into sobs and curses, that a lady, who had been the intended of Lucius Caesar, and the prospective daughter-in-law of Augustus, should be sacrificed to a man so humble of birth, but influential owing to his childless old age. Seneca, moralizing in the same tone as Juvenal, does not only absolutely admit that in competitions for the high offices the nobles secured them for many profligates in preference to meritorious 'new' men, but adds this happened 'not without reason'. Thus his ancestors, Verrucosus Allobrogicus and the three hundred Fabii, obtained for Fabius Persicus (consul in 32) his election to the highest priesthoods, in spite of his notorious vices; and Scaurus, who had been consul in 115 B.C., and the *princeps* of the Senate, assured his descendant Mamerkus Scaurus (who died in 34), a man of like ill-fame, the consulate. Tacitus praises Tiberius for regarding the nobles in the early part of his reign in distributing the honours; and Pliny Trajan for preferring them, Domitian out of fear and mistrust not having ventured to select them. Officially then, and administratively, and everywhere, noble descent was a great advantage, and an asset, even if possessions, on which rank and pre-eminence were based, might be actually valued at a higher rate.

And the history of many families that flourished even under the Empire was venerable. True, few were left in the first century of those who could point to eight hundred years of senatorial rank from Romulus or Brutus; some there must have been, for fifty families were known at the close of the Republic, who claimed Trojan or Alban lineage, both pre-Roman. In a manual of Greek dialogues for teaching purposes, there occurs the sentence: 'I will visit a senator who can trace his descent back to Romulus and the Aeneadae'. Such were, above all, the Julii, who in their funerals had the images of Aeneas, Romulus and the Alban kings carried in the procession. The Quintilii (of whom came Varus, who fell in the Teutoberg forest) were of Alban descent. The Antonii and Fabii made Hercules their first

ancestor, the Aelii Lamiae, Lamus, king of the Laestrygones. The Calpurnii Pisones derived their race from Numa ; Gnaeus Piso, the head of the house under Tiberius, would scarcely allow of the Emperor's precedence, and looked on his sons as inferiors. Generally, pedigrees extending into the world of fables were not rare ; Greek erudites would willingly elaborate them. A work dedicated to Quintus Vitellius, the uncle of the Emperor, whose origin was according to others so low, ascribes his race to Faunus, king of the Aborigines, and Vitellia, a goddess locally worshipped. It was perfectly well known that Vespasian's grandfather had come from Reate, and had been a centurion in the Civil War, and his father had been a tax-farmer ; but an attempt was made to trace the Flavii back to a companion of Hercules ; Vespasian himself laughed at it. The Emperor Galba, who was of the ancient and noble house of the Sulpicii, had an ancestral tablet put up in his *atrium*, recording his paternal ancestry up to Jupiter, and his maternal line to Pasiphae, the daughter of Minos. Even those who, with the incredulous, abandoned these pedigrees, or themselves bemoaned them, at other times found them serviceable, and could use them, without being ridiculous. Thus Julius Caesar in his funeral oration for his aunt Julia celebrated her descent from Ancus Marcius on the one hand and Venus, the grandmother of Iulus, on the other. Manius Acilius Glabrio, too, whom Pertinax designed as his successor (he was consul for the second time in 186), traced his descent to Aeneas, as did the family of Marcus Aurelius to Numa. Herodes Atticus boasts of his wife Annia Regilla, the sister of Appius Annianus Bradua (consul in 160), that she was of the princely blood of Anchises and Venus, whilst Herodes' own tree remounted to the Aeacidæ : in Greece families were frequently ascribed to heroic founders. The *acta* of the Arval priests gives very splendid lists of the noble names who constituted the College. At one sacrifice made by Caligula in the end of May, 39, only three members present had been ennobled by Augustus, Taurus Statilius Corvinus, Gaius Caecina Largus (consul in 42) and Annianus Vinicianus. The others were Paulus Fabius Persicus, Gaius Calpurnius Piso (already mentioned), Marcus Furius Camillus ('the last scion of Veii's conqueror'), Appianus Junianus Silanus, and Gnaeus Domitius Ahenobarbus, the father of Nero ;

the ancestors of the last two had often 'worn the Republican purple'. During the Republic the Domitii Ahenobarbi counted six consuls, and two under Augustus, two censors and two triumphs. No *gens* could rival the Claudii for tales of fame; their beginnings were lost in the early Republic; they had twenty-two consulates, five dictatorships, seven censorships, seven great and five petty triumphs to their score, besides many illustrious men and women, mighty for good or for evil; their measureless pride and unbending sternness was hereditary. Further, old pedigrees were valued highly to the last days of the Empire.

The custom of adding new names to the original, besides retaining both the original and the adoptive, under the Julian and Claudian reigns was rare: after the Flavian epoch, when 'new men and new ways came into power', frequent. Adoptions and quasi-adoptions, the use of the maternal besides the paternal names, from sheer family vanity, and for other reasons, swelled the nomenclature of the Roman nobles: under Trajan men like Quintus Pompeius Falco had more than ten names: and his son, Quintus Pompeius Senecio (consul in 169) no less than thirty-eight.

But princely wealth was a more common ornament of senatorial families than ancient lineage. Opulence and senatorial rank were interchangeable terms. Gnaeus Lentulus the augur, under Augustus, possessed 400,000,000 sesterces, the largest private capital known in antiquity. Two hundred million even was enormous; Vibius Crispus possessed this amount, and Martial uses 'richer than Vibius Crispus' as a superlative. But fortunes of three hundred or more were not rare amongst the senators. Tacitus mentions a letter of Nero to Seneca, who was very rich, that many, his inferiors in desert, were wealthier, as, for example, Lucius Volusius Saturninus, who died as City Praefect in 56, at the age of 95; not to speak of freedmen. Eprius Marcellus, too, from his poor beginnings amassed no less. The annual income of such properties would have been nearly as much as the revenues assigned by Olympiodorus to the richest Roman families at the beginning of the fifth century, viz.: £243,600. Capital bore, as above remarked, high interest, and even land-investments brought in more than 6 per cent. A capital of 300,000,000 (£3,262,800) at 7 per cent. yielded £228,396 yearly.

Doubtless the old Italian senators possessed large Italian estates. When provincials were legally admitted (106-7 A.D.), Trajan enacted that suitors for curule offices should lay out a third of their property in Italian land, so as to have a vested and not a passing interest. Marcus Aurelius fixed the proportion for foreign-born senators at one fourth. It must have been the practice to purchase in several counties at once, that untoward weather might not affect the whole of the income, and all climates and lands might be home. Even in Horace's day Sardinian cornlands, Calabrian beehives and pastures there and in Cisalpine Gaul, 'a thousand acres of Falernian vines', and estates on the banks of the Liris, all might be one property: one hundred years later, herds from Parma (worth 600,000 sesterces annually), Etrurian estates worked by thousands of slaves in chains, vineyards at Setia, and properties at Hybla, the home of bees, in Sicily. Marcus Aquilius Regulus, a prominent man under Nero and Domitian, owned estates in Umbria, Etruria, at Tusculum, on the road from Rome to Tibur; Pompeia Celerina, the mother-in-law of Pliny the Younger, at Otricoli, Narnia, Carsulae and Perusia. The Aurelii Symmachi in the second half of the fourth century possessed three palaces at Rome and one in Capua, fifteen villas near Rome or on the fashionable coast-towns, such as Ostia and Lavinium, and in the hills (Tibur, Praeneste, Cora), in the Gulf of Naples (Formiae, Cumae, Bauli, Baiae, Puteoli, Naples, and on the Lucrine lake); properties in Samnium, Apulia, Sicily and Mauretania. Senators, as officials, would often buy provincial estates. After Trajan's edict provincial suitors for curule offices would sell in the provinces to buy in Italy. Gordian I 'owned more provincial estates than any subject'; his world-spread possessions, made Probus, the praefect of the Praetorium (386 A.D.), world-famous. A decree of Arcadius and Honorius has reference to senators who lived at Rome, but owned lands in scattered and distant provinces. Provincial senators would naturally have properties in their own provinces. In A.D. 49 those hailing from Narbonese Gaul obtained permission to visit their estates without leave, a privilege already obtaining for Sicily. Rubellius Plautus had inherited estates in Asia, and Flavius Ursus, a favourer of Statius, besides at least four in Italy, in Crete and Cyrene. In Nero's day half of Africa

belonged to six great landowners, and, under Domitian, in Africa and elsewhere, private property not only equalled but often excelled in size the municipalities, containing peasants' villages and a little town around the manor-house; some of these wealthy owners must have been senators. Seneca did not exaggerate in speaking of vast stretches cultivated by slaves in fetters, cattle-ranches wider than kingdoms and provinces; or when Columella speaks of realms their sovereigns could never ride round. Everywhere no lake whose waters did not reflect some great palace, no gulf by which their villas did not stand; from every lofty height over land and sea, their roofs glittered. Their palaces in Rome had royal forecourts, high *atria*, rich baths, libraries, galleries, peristyles, groves of laurels and planes, fountains, drives and walks; were as extensive as county-estates, were 'like cities'; if as large as the whole property of Cincinnatus (four acres) they were deemed too petty. Martial calls his patron Sparsus' Petilian palace a kingdom: from the ground floor there was a view down on the highest peaks of Rome: it was a *rus in urbe*, and the vintage greater than from a Falernian hill. Inside the portals there was room enough to drive in light carriages: no noisy streets, no too importunate daylight could disturb sleep.

A great house of old, then, with its thousands of slaves and freedmen of all nationalities, was a little and almost self-sufficient state; the inmates consumed its resources, maintained and furthered its prosperity: they also supplied some of the needs furnished nowadays by industry: the ennoblement and beautifying of life in art they also supplied, as well as some of the advantages of applied science. There were also many wholly or partially dependent, who were there nourished; many, too, who owed to their patron's munificence their stay and help in life, and many who saw their better days renewed. Slaves, on their manumission, generally received a donation more or less generous. Martial instances one of 10,000,000. The families, too, of dependents and clients received gratuities and protection. And a freedman of Cotta Messalina, a friend of Tiberius, celebrates, on his tombstone in the Via Appia, how his patron often gave him sums amounting to the knightly census (400,000 sesterces), educated his children, provided paternally for his sons, conferred a military tribunate

on his son Cottanus, and paid the expenses of that tombstone.

About the year 50 the highest place and the greatest influence amongst the old nobility had fallen to Gaius Calpurnius Piso, who headed the conspiracy of 65 against Nero, to win the throne, and lost his life. Caligula had banished and Claudius recalled him, reinstated him in his property and made him consul : his mother's inheritance still further increased his. Every aptitude for popularity he possessed, stateliness and handsome features ; he was affable, even to strangers, eloquent and ready to defend the oppressed, not sternly moral, a lover of joy even to excess, fond of pomp and generous to extravagance, skilled alike in poetry and the cithar, in games with balls and dice and in combat. He helped knights and senators whom misfortune made poor, and aided annually a number of men of the third estate in gaining the knighthood. For a generation after his death, his generosity was the poets' theme.

After Nero's reign, the position of the aristocracy altered. In replacement of the old families, partly ruined, partly extinct, a new and increasing generation of Italians and provincials arose, who remembered their days of poverty and practised a parsimony, which Vespasian initiated. Domitian, too, by himself served as a reminder to the grandees not to excel in splendour, generosity or retinues ; it was only under Trajan they dared again freely 'give, increase little incomes and distribute their surplus'. And Martial was right in wishing back the days of the Pisos and Crispuses, Senecas and Memmii. Then, he says, many friends there were who would confer on their client the golden ring (in other words, give them the 400,000 sesterces or knightly census) ; not so now ; happy is he whom a knight of his house befriends.

But, even then, the life of the senators was brilliant and gorgeous, and a revenue insignificant for a senator would be no small one. At the beginning of the fifth century houses of the second class had an average income of 1,000 to 1,500 pounds of gold (£45,625 to £68,510). Pliny the Younger, who could scarcely support his state, gives us some inklings of the balance-sheet of a senator in Trajan's time, neither very rich nor very noble. His family came of the municipal nobility of Comum : at the age of twenty-seven, he climbed the first rung, and was quaestor, and ascended the ladder quickly, at thirty-eight, 100 A.D., being appointed consul by

Trajan. His three marriages probably augmented his wealth, which for a municipal was considerable; the inheritance of his uncle, his work as heir administrator, no doubt brought him much wealth indirectly, e.g. by legacy, as he refused rewards and gifts. As praetor, he economized in the spectacles. His property was mostly highly profitable vineyards, but he diminished the income by his solicitude for his agents and purchasers. He also lent money on interest. Near Tifernum Tiberinum, in Etruria, he possessed lands rented at more than 400,000 sesterces; at Comum, where he sold an inherited estate worth 900,000 for 700,000 sesterces, and at Beneventum: also several villas on the Lacus Larius (Lake of Como), and one by Laurentum, all fitted up, as he says, modestly and comfortably. About the year 101 he was intending to buy an estate for 3,000,000, and had to borrow from his mother-in-law. His economical management enabled him to be generous towards clients and friends in need, and he collected no few letters in testimony. He presented his nurse with a little estate worth 200,000 sesterces, and the same sum to a relation on her marriage, whose apparently large debts he remitted after her father's death. A fellow countryman of his, for whom he obtained a centurionship, received from him 40,000 as his outfit, and another, a schoolfellow, was advanced 300,000 sesterces, to qualify him for knighthood: Martial obtained from him travelling-money on his return to Spain, in return for a eulogistic poem. In the city of Tifernum Tiberinum, where he was patron, Pliny had a temple built at his own expense, and gave a banquet at the dedication: a temple of Ceres was collapsing in one of his estates, and, instead of repairing it, he built a new and beautiful building with a hall of columns: he ordered four marble pillars, and marble to adorn the walls and floor, and a statue of the goddess to be made. His father had left the Comenses 40,000 sesterces, to pay for the distribution of oil annually at the Feast of Neptune in all the *thermae* and in the theatre; Pliny, imitating him, gave large sums to his native city, eloquent of his 'Italian local patriotism'. He presented the city of Comum with a library worth 1,000,000 and invested 100,000 to maintain it; and offered to pay a third of the fee of a rhetorician in that town. And again he gave 500,000 sesterces to provide for free-born

boys and girls ; the interest, 30,000 (at 6 per cent), was to be derived from land, to be transferred to the community and then acquired by the heirs. And in his will he left the town an unknown sum for the erection of *thermae*, and for their furnishing at least 300,000, for their upkeep the interest on 200,000 ; as well as capital amounting to 1,866,666⅔ sesterces to provide for a hundred freedmen of the testator, and, in remainder, to pay for an annual carouse for the whole community of Comum.

Such were, then, the means at the disposal of a poor senator ; evidently the senatorial census of 1,000,000 (about £10,875) must have been the minimum sum at which a suitable state could be maintained by a single individual only. Larger properties may well have been found in the middle classes at Rome ; Martial makes one braggart boast of an annual income of 3,000,000 from his lodging-houses and properties, 600,000 from his herds from Parma, besides money out at interest. Prosperous municipals even and provincials often obviously possessed (as their legacies and gifts prove) more than the senatorial census. The father of Apuleius left two millions, the father of Herennius Rufinus in Oea (according to Apuleius) three, the widow Pudentilla, whom Apuleius married at Oea, four. In the colony of Petronius, one of the *honoratiores* inherits thirty from his father, and Trimalchio is made to leave as much, for he lost three millions in a shipwreck, gained ten on a more fortunate voyage, and hoped to marry as much again. Nero scattered amongst needy senators, and Vespasian gave indigent consuls 500,000, the half of the senatorial census.

Members of this aristocracy were all alike on a lofty eminence, scanned by all eyes, unable to evade the manifold claims made on them from all sides, without *opprobrium* or falling short of the standard of their rank. Horace was glad of his humble birth, which relieved him of a wearisome burden. He had not to busy himself with money-making and visiting, and could travel by land without trains of horses and waggons and livery-men. A praetor at Tibur with only five slaves, carrying culinary articles, had made himself supremely ridiculous. The poor poet was far more comfortable than the glorious senator. And senators have to dress up to their rank. As late as Hadrian when broad cloaks (*lacernae*) and

sandals were usually worn in the streets, senators might only decently have the cumbrous *toga* and high-laced shoes. Tiberius deprived one senator of the purple for having moved to a garden-house before July 1 (the general time of moving), so as to rent an empty dwelling more cheaply. A man who only pays 6,000 sesterces for rent, Velleius then wrote, hardly counts as a senator. As a fact, the comparatively simple standard of the day is shown in that a senator in so expensive a town as Rome could rent a house at £65 5s., at a time when the acreages of the palaces were complained of. But, after Tiberius, luxury became frightful, the Emperors inciting and heading it. Vespasian restored economy. Senatorial families vying in extravagance and pomp, in palaces, decorations and retinues, exhausted the most boundless properties, and no few sank into debt and poverty.

To maintain their rank was expensive enough ; an official curule career still more so. The outlay was enormous, especially the necessary public games. The Megalensian Games cost the praetor (end of the first century) 100,000, and even then were scantied ; other games 20,000 : the year of honour might cost more than half of the senatorial census. Should a poor friend approach him for 100,000, to admit him to the knightly census, the reply would be, he wanted the sum for Scorpis and Thallus, his charioteers, and would be glad enough to be able to draw his purse-strings in. But, asks Martial, were not such an outlay better than for horses and a saffron-sprinkled stage ? The same author remarks that a cautious woman would obtain her divorce before her husband became praetor, as he might well ruin himself, and, in Juvenal's phrase, become ' his horses' prey '.

Whilst the senators were constrained to such expenses, they were hampered in the means of increasing their wealth. Business and travels hindered the administration of their estates. Men of high rank, says Epictetus, could pay little heed to their own affairs ; they must travel afar, as commanders or in subservience, to defend the arms of justice, or wield the arms of war ; without they had been sent to the most diverse lands, they might never attain the prizes in their career. Such was the official life of Julius Agricola, the father-in-law of Tacitus. He was born at Marseilles in 39, and there grew up : at the age of nineteen served his first campaign

in Britain ; in the year 61 came to Rome and married. His quaestorship he entered on December 5, 63, in the province of Asia. In 66 and 68 he was tribune and praetor at Rome. Vespasian gave him the command of the twentieth legion, which was quartered in Britain : on his return in 73 he was made governor of Aquitania for three years. In 77 he became consul, and in 78, as consular legate, went for the third time to Britain, achieved its conquest, in seven years, up to the Forth and the Clyde. After his recall, he lived a retired life at Rome, refusing, in view of Domitian's perilous jealousy of him, the governorship of Asia and Africa, one of which would have fallen to him by lot. His career was, in no wise, exceptionally full of vicissitude : the leisure left to senators for their own affairs after official requirements can be imagined.

Further, they were legally debarred from all business. Julius Caesar had re-enacted the old Claudian law of the time of the second Punic War, that no senator or senator's son might own a ship of more than 300 amphorae (12 tons or 240 centner). Hadrian enacted that no senator, in his own name or otherwise, should farm taxes, a mere renewal of the old Lex Claudia, prohibiting them all public contracts and speculation : at the Games of Mars Ultor and the Apollinarian and other votive Games, they were allowed to provide horses for racing, only to make these games more reputable. But these interdictions could be easily evaded by conducting business under another's name, or by joint commercial enterprises, or by conducting financial businesses in the names of freedmen and slaves. Thus Vespasian embraced commerce, after his proconsulship in Africa, to gain the necessary means for his social standing, and Pertinax in Liguria similarly used his slaves. Money-loans at interest were allowed, but these failed to satisfy most of the senators ; in the year 33, a financial crisis obliged the government to intervene, and the whole Senate was perturbed, as they were one and all concerned in usurious dealings. These transactions were mostly in the provinces, where the rate of interest was higher than in Italy, generally at about 8 to 9 per cent. Thus Seneca had to force a loan of 4,000,000 on Britain, and his sudden call for it caused the revolt of 60 A.D. In his last years, through his agents, he was negotiating in Egypt, and the corn-fleet regularly brought him news of his monetary affairs. When Antoninus

Pius, as a senator, lent his money at the low rate of 4 per cent., it was to help as many as he could of his peers and a mark of his unselfishness.

But most of the senators invested in land and slaves. Slave-labour could be very profitable; they would do business and handicrafts, and they could be let out. And land, too, was used industrially for such purposes as sandstone, minerals, tiles, potteries and other manufactures. The manufactory of large dry-goods was common amongst the great land-owners, the Emperors and their families and noble ladies derived much income from tile-factories. The names of the two brothers Gnaeus Domitius Tullus, and Gnaeus Domitius Lucanus, two of the richest senators under Domitian, are often found stamped on tiles; tiles, too, of quite different and independent fabrics. Domitia Lucilla, the daughter of Lucanus, who was adopted by his childless brother, inherited both of their estates and the manufactories, and left them to her daughter (of the same name), from whom the Emperor Marcus Aurelius inherited them. And other manufactories were carried on on great estates. Pertinax, as consul, expanded a felt-factory in Liguria he had inherited from his father, by buying further land and erecting new buildings: and himself spent three years there, using his slaves to sell the products. Landowners whose property was adjacent to the highways built inns, and got from the Senate the right of holding fairs and markets there.

Apart from these kinds of industry, senators had the advantage of paid posts, often very remunerative, in the army, the administration and the provinces. A young nobleman who had raced away his whole ancestral inheritance might still hope for a cohort: a tribune was paid 25,000 sesterces (over £270). Legates, who governed the imperial provinces, and had been consuls and praetors, and proconsuls, the governors of the senatorial provinces, also had fixed salaries: the proconsul of Africa receiving 1,000,000.

Extortion, too, though not as gross as under the Republic, often enriched provincial governors. The Senate itself—a body too predisposed to condone its own members, and very open to bribery, was the Court before which they had to appear. Seneca says in bitter irony: ‘The provinces were plundered, and judgments knocked down to the highest

bidders', no remarkable fact, as the purchases could be resold by the *ius gentium*. Pliny the Younger, in the years 100 and 101, was taking up the cause of Baetica and Africa, which in one year had been harried and pilfered by Marius Priscus and Caecilius Classicus, their proconsuls. Classicus died before trial, but had left a catalogue of his extortions, and written to a Roman mistress of his, that he was returning free of debts, having sold part of the Baetici, and so released 4,000,000. Priscus was convicted of executing the innocent for money. Under another legate a provincial bought the flogging of a Roman knight, his condemnation to the mines, and his strangulation in prison for 700,000; his dandified middleman in the business, the legate, exacted, as his commission, 10,000, 'to buy scents and pomades'. The legate was not expelled from the Senate, and only punished by being passed by in the allotment of provinces. Marius Priscus, banished from Italy, retained wealth enough 'to find consolation in the wrath of the gods'. Even under Trajan, such barbarous and notorious misgovernment could be highly condoned; its frequency in the overtaxed provinces is well vouched for. Tiberius used, on principle, to make conscientious holders of governorship continuous; as power also incited avarice, inversely to the length of duration. He compared the provincial to a fly-blown wounded fox, who would not have his blood-suckers blown off. Whether this permanency did alleviate is questionable. Quintilius Varus entered Syria poor, and, after nine years, during which he became rich, left it poor. When the 'extraordinary moderation and abstemiousness' or 'guiltlessness' of Vitellius' and Otho's administration is lauded, proof sufficient is given of the exceptionality of it. Any province that applied to an advocate at Rome to take up its cause was sure to be one which had been plundered out and out. Juvenal exhorts one great nobleman, when his province fell to him at last, to show his helpless allies some consideration, as their very marrow had been sucked out. The victims got no good of the condemnation of their oppressors, for law exhausted the prosecutor's purses, and a Pansa had to be paid for punishing a Natta's robberies. Verres and his contemporaries withdrew the greater portion of an immense opulence. There was nothing left but a few yokes of oxen, some herds of mares, a few

little estates and the statues of the house-gods. Should the suite of the governor be blameless, should no curly-locked boy barter legal decisions, were his wife free from debt; if she did not, harpy-like, tear through the cities and carry the circuits by storm, this much merit might outweigh the most ancient lineage. 'Poor State', the claimant Avidius Cassius writes: 'the prey to the greed of all its rich!' For the over-gentle Emperor should execute freely, and restore order: were men who believed provinces were given to them by Senate and Emperor, as the only source of carousals and gold-mines, to be appointed proconsuls and legates? 'Yet, be their riches ever so great, if the gods are just, the fisc will absorb them!'

Less wealthy senators, unwilling to serve in the army, unable to bear the expenses of public life, might serve as advocates: the fees for defence had been successively reduced to 10,000 sesterces, but these enactments were easily evaded, and popular advocates earned large sums. But the many, especially in the first century, who abused their talents as accusers in trials for high treason, were still more highly paid; thus did Regulus, Vibius Crispus, Eprius Marcellus, gain their immense fortunes. Regulus received, as his reward, the consulship from Nero, a priesthood and 7,000,000; under Domitian he had prospects of continuing the business and realizing a sum of 120,000,000. Vibius Crispus, the Croesus of his day (under Domitian), had 200,000,000 and Eprius Marcellus 300,000,000.

It is hardly possible that the legal lore of senators, to whose ranks the great jurists of the first and second centuries belonged, was a direct source of income. Indirectly, the influence, honour and esteem of it advanced them to highly advantageous posts, such as those of imperial councillor (after Hadrian a paid and permanent office), the City Praefecture, which was held by the great jurists Pegasus (under Vespasian and Domitian) and Salvius Julianus (under Hadrian). The consulate even fell to the lot of no few great jurisconsults of the first two centuries. Antistius Labeo is said to have been of too independent a mind to receive or accept it, as also Aulus Cassellius. Ateius Capito, Labeo's rival, was more pliable, and was consul in 5 A.D., as Marcus Cocceius Nerva in 22 A.D., Gaius Cassius Longinus in 30, Caninius Rebilus (who died in 56) at an unknown date, Caelius Sabinus in 69, Pegasus

perhaps under Vespasian, Neratius Priscus about 83 A.D., Publius Juventius Celsus under Trajan and again in 129, Salvius Julianus twice under Hadrian, Pactumeius Clemens and Marcus Vindius Verus in 138.

Often then lawful and honourable earnings could not meet the great social outlay, and, as might be expected, senators were constantly in direst need. Some were forced to sell themselves as performers in the public games, especially under Nero. When Vitellius was sent to Germany by Galba as consular legate, he was so hard pressed that he had to pledge a pearl his mother wore in her earring, let his palace for the rest of the year, and leave his wife and children in a common lodging-house: hardly could he bluff his thronging creditors. At Nero's death, Otho owed over 200,000,000. Many possible senators remained knights rather than be liable to such burdensome honours, or had to be forcibly ennobled. One Surdinius Gallus in 47 repaired to Carthage to escape the infliction of the honour; was ordered home by Claudius to sit in 'golden chains'. Other knights who refused Claudius degraded.

And very constantly did senators beseech imperial aid, or their own degradation. Generally, the Emperors willingly afforded relief to their former colleagues, and gladly took thought for the conservation of families of ancient fame: but, whilst their efforts could not wholly supplement, their readiness would vary. Augustus was very generous in this respect, and in 4 A.D. brought the property of eighty senators up to 1,200,000 sesterces: and one senator whose 4,000,000 of debt he had paid off, wrote complaining that he was passed over. Tacitus informs us that Tiberius retained the virtue of generosity to the last, and as his last: yet the superabundance of requests obliged him to grant help only in cases of poverty proved to the satisfaction of the Senate: he thus scared many claimants. Thus to Propertius Celer, who already had been praetor, he gave in 15 A.D. 1,000,000, as he was known to have inherited poverty. Marius Nepos, another senator, requested the payment of his debts: Tiberius made him name his creditors, then paid the amount, but added a severe reprimand. Hortensius Hortalus, a grandson of the orator, was enabled, by Augustus giving him 1,000,000, to found a family and prevent the famous name dying

out. Hortalus, in 16 A.D., accompanied by his four sons, appeared in the Senate and begged for relief of his penury. Tiberius brusquely refused; offensively doled out 200,000 to each son, and would hear no more of them. The family sank and vanished. Spendthrifts he either expelled from the Senate, or he accepted their resignations. One notorious evil-liver, Acilius Buta, who used to turn night into day, after drinking his huge fortune up, announced himself as impoverished: Tiberius told him he had woken up too late in the day. In the beginning of his reign, Nero scattered broadcast gifts of half a million to poverty-stricken families; for example, to Valerius Cotta, his fellow-consul in 59, and to Aurelius Cotta and Haterius Antoninus, though they had consumed their inheritance. Vespasian, too, was very generous, made up the amount of the census and gave needy consulars annual incomes of half a million. Hadrian distributed to senators, when innocently bankrupt, moneys proportionate to their families, sufficient for their state and often for life. Not only his friends, but even men of most evil fame received subsidies for the curule offices: he also aided women, probably only of senatorial rank. Hadrian, as praetor, under Trajan, had received 2,000,000 for the spectacles. Antoninus Pius, following the same practice, lent Gavius Clarus, who, on his scant net inheritance, had undertaken the quaestorship, the aedileship and the praetorship, funds out of the imperial purse to meet the expenses of the praetorship, and was repaid in full. Fronto, a close friend of Clarus, writing to Lucius Verus, says that he, were he better off, would willingly help him to meet his senatorial dues. Customarily senators would assist their impoverished colleagues for the honour of their rank: such had been the royal generosity of Gaius Calpurnius Piso.

The first order of the State seems to have acknowledged a limited obligation of mutual assistance; thus friends and even more distant colleagues would give and take contributions for the games. Julius Graecinus (the father of Agricola), who was executed under Caligula, refused the moneys sent to him with this object by the consulars Fabius Persicus and Caninius Rebilus on account of their evil name, whilst accepting from others: Seneca regards this slight as a kind of censorship. If a notable man's house was burned down, Juvenal says

the whole aristocracy would be in mourning, the praetor would suspend public business, contributions would flow in so richly as to make fires almost profitable speculations : but the poor man, whom a fire deprived of all his goods, got shelter and help from no one.

The custom of many scattered legacies was so general as to be a regular source of revenue for most senators. Pliny the Younger congratulates himself on so often being named together with Tacitus. Unless the testator was a special connexion of one of them, they would be named jointly for equal sums, as probably in the will of Dasumius (109 A.D.). Further gifts between man and wife were exceptionally legalized, if for the purpose of maintenance or gain of rank, and the ease with which senators, and noble senators especially, married money, is illustrated by a tale of Suetonius. His second beautiful and rich wife had forced herself on Galba's father, despite his ungainly dwarfishness. And, as a rule, a purple stripe was a woman's great ambition.

There was one great lure in the senatorship, outweighing the many burdens and the many delicate restrictions, which lent one great sense of their high dignity and consciousness of being the aristocracy of the world : this was their monopoly of the Republican offices. Then even, stripped of all their ancient might and meaning, the glamour of these offices dazzled the eyes of the keenest and the best. In the later Roman world, one most remarkable feature is how this wretched shadow of bygone greatness could for centuries replace the reality that had passed away, could arouse all the old reverence, and resistless fascination. This feeling was ineradicable ; down to the very end of all, surviving Rome herself, the consulate remained man's highest prize. In her tottering nonage, when it had become a mere gaud, Julian called it ' the supreme honour ' ; in the sixth century, when it was a mere senseless name, it ranked as ' the supreme good, the greatest honour in the world '. All the less surprising is it if, in the young Empire, a Tacitus even looked on the consulate as the loftiest ambition, when it was not altogether functionless, and when its tenures by the Emperors were ever making it more splendid. He concludes his summary of Agricola's career thus : ' He had attained a triumph and the consulship ; could Fate vouchsafe him more ? '

And how far the vanity of less gifted minds could persuade itself that these functionaries were all they seemed and portended, is strikingly manifested by the way in which Pliny the Younger speaks of the tribunate, the least and most foolish of them all. He found it incompatible with his year's tenure of this honour to act as advocate. 'It makes all the difference, at what the tribunate is valued, as a mere fiction, a name devoid of real honour, or as an inviolable power, which no one should limit, not even the possessor. When I was tribune—I may have been wrong—but I believed I was somebody, and thus would not act as advocate in the Courts: first, because I deemed it unseemingly that he should stand and all others sit, before whom all must stand and give way; and that he, who can command silence, should be interrupted by the waterclock, and that he, whom none may contradict, should hear insulting speeches; speeches he must be weak and leave unavenged: or strong and seem contumacious.'

The first senatorial office, the quaestorship, was, after Augustus, preceded by a complex of offices, known as the *vigintiviratus*. Further, every aspirant to curule rank had to do officer's services, the lowest age being eighteen: originally, before entering the *vigintiviratus*, sometimes after; which became the general rule. One term of service, for at least a year, was required. After Tiberius they served only as legionary tribunes. All the Emperors, up to and including Gordian, insisted on this preliminary service.

The obligatory succession of Republican offices had been the quaestorship, praetorship and consulate; between the first and second Augustus inserted another, comprising the two aediles and six new ones, and the ten tribunes; hence there were four degrees of senators, consulars, praetorians, tribunicii (among whom aedilicii are included) and quaestorii. Each rung had to be ascended; but the patricians, who could only hold the two curule aedileships, were allowed to pass direct from quaestorship to praetorship. The twenty *vigintiviri* became the twenty quaestors, out of whom the sixteen aediles and tribunes were selected; after passing patricians over, the aediles and tribunes became praetors, of whom there were sixteen to eighteen, eighteen being assigned under Claudius and remaining the normal until Hadrian. These figures prove the double tendency to make every senatorial aspirant

praetor at least once, and to present only sufficient candidates to fill vacancies, or, in other words, make the senatorial selection illusory. In practice, the Emperors used to dispense from the *vigintiviratus* and nominate senators to the ranks of *tribunicii* and praetorians without holding office. The caprice of the Emperor dictated the Senate's freedom of choice.

The consulate, the highest ambition, after Nero at least, was in the gift of the emperor; the consuls were increased in number. After A.D. 2, if not before, the consulate was generally for only six months; the year of office a distinction very rarely granted, save to members of the reigning family, the last instance being A.D. 52. Augustus and Nero generally appointed four consuls a year: Caligula and Claudius at will. In the year 69 there were three Emperors, Galba, Otho and Vitellius, and fifteen consuls. Six months' consulates are heard of no more: four months, two months was the arbitrary duration, two months mostly in the third century: Cleander, the chamberlain of Commodus, in one year nominated fifteen consuls. The Augustan order of honours stood firm for over two hundred years.

Between every tenure there had to be an interval. The lowest age for the quaestorship was, after Augustus, twenty-five, and thirty for the praetorship, for the tribunate twenty-seven, and the consulship thirty-three. There were exceptions, especially the right accorded by Augustus to the Senate, to release one year of the interval for every living child the competitor might have.

The correspondence of the numbers of the three lower grades assured quaestors of success in their further promotions, and besides the dispensation of patricians from the third there would doubtlessly often be an ample supply of qualified candidates, as the Emperors used to confer the rank, irrespective of the office. The censorial prerogative enabled the Emperors to range the senators more and more in these three orders of officials who had not served any of the three offices. The numbers of these were, later on, very great. This *adlectio* or promotion carried with it all political rights and pre-eminences derived from the real magistracies, namely, the right of competing for the higher posts.

Besides this real promotion by the Emperor the Senate could also simply confer the *insignia*. Such grants plainly gave

mere outward form and semblance, neither the right to compete higher, nor a seat in the Senate; only qualifying those who could already vote in the Senate, to vote with the rank whose *insignia* he bore, and, at public festivals, to appear in their company. The holders of the *insignia* had a merely titular dignity: those appointed by the Emperor, or holders of office, had the real privileges. Claudius, in vain, begged Tiberius for the consulate, and only received the consular *insignia*. He sent in a second urgent request, and was told Tiberius would give him fifty gold pieces to spend at the *saturnalia*. When Nero was blamed by his friends for neglecting Octavia, he said she must be content with her *insignia* as consort.

Sejanus was the first knight to receive such a grant (A.D. 19) on his appointment as praefect of the Praetorium. These praefects henceforth regularly received the same consular *insignia* (after Nero), as did the praefects of the Nightwatch, and other influential favourites, who were knights, and also imperial procurators, and, under Claudius, even imperial freedmen. Such decorations were also conferred on independent princes, as, for example, Agrippa, King of the Jews, under Caligula, received praetorian, and, under Claudius, consular *insignia*, and his brother Herod (under Claudius) the praetorian. As with modern decorations, the higher grants tended to supplant the lower.

The three lower offices were also filled by the Emperors, though originally in part only: they would advise the Senate what appointments would be legally valid; the rest were the nominees of the Senate. After Nero, the Emperors appointed all of the consuls, and the shortening of the tenure enabled them to spread rewards for merit or servility more broadly, and assure the submissiveness of more senators: and a new distinction of rank grew up, as the consulate for the first two months was more of an honour than for later periods of the year. The increase in number of the annual consuls rendered the censorial appointment of titular consulars superfluous, a practice which came in in the third century, first under Opellius Macrinus, and often after Diocletian. But beyond a second or third grant of the consulship imperial favour could not go, nor could ambition hanker higher; such a distinction was rare; Hadrian and his two predecessors were

lavish with it, even to non-members of the imperial house. The last subject to have a third consulate was Hadrian's brother-in-law, Julius Ursus Servianus (134 A.D.). Trajan used to confer this triple honour, not only for military service, as before, but also for civil. Pliny says that Verginius Rufus attained the utmost honour, short of the Empire, having been consul three times (the first two being in 63 and 69). A second term of office, a more frequent bestowal after the Flavian epoch, and especially under Hadrian, Caracalla and Alexander Severus, was also a great distinction.

The magistracies, now practically bared of their ancient significance, now assumed a new garb and a new value; they betokened a higher rank, and, as evidence of imperial favour and satisfaction, were eagerly sought after. Formerly (that is, under Domitian), Pliny the Younger remarks in his speech returning thanks to Trajan for the consulate, the zeal of even the best would be chilled by a certainty of the Emperor's ignorance or neglect of their doings (especially in the provinces); now, the prospect of promotion and fame could spur on every one to keener emulation with a more individual scope of action. At last, honourable desert in a lower office would be the best recommendation to a higher. In 103 or 104 Pliny requested of Trajan a vacant Augurate, as a proof of his good opinion of him: it was granted, and in reply to a letter of congratulation, he says that to be able to secure the honour on so slight pressure is really a good sign. Servility saw in promotions by imperial favour an irrefragable evidence of personal worth. A knight, who, after the fall of Sejanus, was indicted because of his friendship with him, defends himself before the Senate, saying: 'Not for us is it to doubt of whom thou raisest and why: to thee the Gods have given the supreme judgment; to us the virtue of obedience. We only see the result, who receives from thee honour or wealth, the power to hurt, the might to help. Unallowable is it to pry into the Prince's secret thoughts, perilous and vain'. Every higher step set the aspirant above some of his fellows, and nearer the throne. Thus the offices of Republican name had got the reality of monarchical dignities.

It may be seen at first sight, how this artificial scheme of titles, dignities and decorations, with its careful and obvious

R.L.M.

K

gradations, answered the purpose of guiding the ambition of subjects in a direction profitable to the monarch. The success of it is shown by the importance attributed to all of the honours, and to the titular ranks as well as the active. The *insignia* by themselves would be conferred only exceptionally, at festivities and Court ceremonies. Alexander Severus contemplated—but never carried his intention out—designing robes for all imperial and curule honours.

Thus the curule offices were the goal of restless desire and unquiet effort; one rung once climbed only showed the next, and roused the longing for it. Ambition, says Seneca, ever makes unsatisfying what had been the keenest wish. For the tribunate no one is grateful; every tribune hankers after the praetorship and then the consulate, and then the consulate again. The greatest exertions were made for the consulate. Many, says Seneca elsewhere, live all the years of their life to have one year named after them. To add one name to the list of consuls, and then to rule Numidia and Cappadocia, says Martial, a senator will in the early morning visit sixty houses. To become consul, says Epictetus, you must cut off your sleep, run about everywhere, kiss hands, wait about at strange doors, do and say what no free man would, give presents daily even.

The acquisition of every office involved similar pains, visits by the candidate and his supporters and recommendations. When Sextus Erucius Clarus the Younger was fighting for the tribunate, Pliny the Younger was in great commotion, as his own reputation was in some danger. He had won of the Emperor Clarus' senatorship, quaestorship and the right of competing for the tribunate, and, if Clarus failed, he would seem to have deceived the Emperor. Hence from house to house did he go, and from office to office, beseeching his friends, endeavouring all he could through favour or rank to enlist support. When Julius Naso became a candidate, Pliny begged his friend Minucius Fundanus (consul in 108) to hasten to Rome and work with him to this end. It seemed to him to be his election over again, and a rejection of Naso would be his own. Acknowledging a letter of recommendation from Tacitus (who was out of town), he says that a recommendation of Naso was the same as one of himself; would he write further letters? To exhaust every legal

means was a candidate's glory. When the young Julius Avitus was named aedile and died before taking office, Pliny praises him for his indefatigable electioneering. But the honour of office would often conduce to humiliating intrigues and servility. Columella, a knight in Nero's day, preferred the modest lot of a country gentleman to the loftiest official eminence, if gained by the tortuous roads of cringing and shamelessness and waste. Ambition, says Seneca, through unworthy ways leads to worship. Promotion was but too often the guerdon of the informer; its price the blood of innocents and the fall of families. In the year 27 a plot was made by three ex-praetors to ruin Titius Sabinus the knight; they were striving for the consulate, 'the keys of which were held in Sejanus' favour, and that could be won only by crime'. Bribery was rampant at Court and in the Senate. Messalina and Claudius' freedmen formally trafficked in offices. Fabricius Veiento was accused in 62 of selling his claim on Nero for promotion or similar grants. But even a Vespasian did not stickle at selling offices and dignities. In 107, a *senatus consultum* announced that candidates should not 'treat', give dinners, banquets, nor money to election agents, a practice hitherto clandestine; treating had been public: and Trajan, at the instance of the Senate, legally limited the allowable expenses.

The election itself down to the end of the first century was delivered orally in the Senate; after Trajan, secretly, and was deemed an important and earnest act. 'At the last election', Pliny the Younger writes, 'on some voting-tablets all manner of jokes and even obscenities were found; the Senate was shocked and consigned the malefactors to the imperial displeasure. What would a man do at home, who could play such pranks on so serious an occasion and time?' The fortunate were as proud as the disappointed were envious. In the year 16 a proposition was made to elect magistrates for five years, and rejected by Tiberius: with the one year's term, the defeated were hardly consolable, and the victors flushed with triumph; a five years' term would make both evils unendurable! Seneca often speaks of the impossibility of sating every desire: 'no one', he says, 'rejoices as much to see many behind him, as he is oppressed with the sight of one in advance. Ambition errs in never

looking backwards'. For 'new men' the day of curule-honour attained was epoch-making. The favoured of fortune would be embraced by his friends, his hands kissed by his slaves, his house illuminated; he ascended the Capitol to offer a sacrifice of thanksgiving, and this, too, was done in his home. Any one who attained a higher rank ennobled his whole family and left his heirs the prospect of newer and greater honours, and a right to them. Tacitus says of Lucius Volusius Saturninus, that, though of ancient lineage, his family was only praetorian; he made it consular. 'If the son of a consular, who has received the triumphal *insignia*, be made thrice consul', says Pliny the Younger, 'it is no elevation, only his family right'. Vitellius was induced to aim at the Empire by the legate Fabius Valens, who pointed out that his father had been thrice consul and censor and colleague of an Emperor; such a lineage laid on him the sovereign's dignity, and robbed him of a subject's security.

There exist other evidences of the reputed importance of these official ranks. Pliny recommends Minucius Fundanus to select as his quaestor during his consulship young Asinius Bassus, with a praetorian father and several consular kin. Calvia Crispinilla, a woman of doubtful fame, according to Tacitus, married a consular, and gained the city's esteem. Quintilian lost his ten-year-old son, a boy of great promise, whose adoption by a consular had paved his way to the honours; he had been destined to marry the daughter of his maternal uncle, a praetor. Writers, whether senators, like Pliny the Younger, Seneca and Tacitus, or not, carefully point out the rank of their friends. On monuments of senators painful accuracy is shown in inscribing their offices in sequence of tenure, even when quite irrelevant. Thus in an inscription set up at Comum after the death of Pliny the Younger, besides a catalogue of his endowments and legacies to his native city, all his offices, from the highest to the lowest, are set down, and the pedestal of a bronze statuette he put up in the local temple of Jupiter was to contain his full titles 'should his friend and agent think good so to do'. In Greek inscriptions, relationship with senators and consulars is expressly set out.

In Republican days, senators had the privileges of wearing a broad purple stripe on the tunic, and the senatorial shoe laced

halfway up to the knee, of having the front seats at spectacles : imperial legislation and tradition at various times conferred, in addition, some other rights. Thus an edict of Augustus of 36 B.C. gave senatorial officers the right of wearing a purple garment as organizers of spectacles. The covered sedan-chair, first used by Claudius, was, in the third century, a consular privilege. About the same time, carriages came into use at Rome ; up to then they had been forbidden ; and Alexander Severus gave senators the privilege of having silvered coaches. In the course of the second century the usual courtesy title of a senator, *clarissimus*, was used to designate men, women, boys and girls, all members of this aristocracy, in a shortened form after the proper name.

In virtue of his censorial powers, the Emperor could degrade senators. Reason might be condemnation, evil fame, loss of property, as well as more specific and occasional motives. Tiberius in 25 erased Apidius Gallus Merula from the roll, for not complying to the Augustan regulations, and, in 32, Junius Gallio, for proposing that the Praetorian Guards should after dismissal have the knights' seats assigned to them ; it was mere servility, but Tiberius imagined it an effort to win the army over. In 53 the Senate expelled a member, incited by Agrippina to bring a false accusation against a distinguished man, who committed suicide. More often resignation would be voluntary. In 52 Claudius in a speech praised those whom poverty drove into willing resignation, and expelled some whose lingering added the vice of impudence to the crime of penury.

Generally expulsion was regarded as a severe blow : seldom borne with the equanimity of Umbonius Silio. He in the year 44 was recalled from the governorship of Baetica (South Spain) by Claudius and degraded from the Senate, on the pretext of having neglected the army in Mauretania, in fact, because of the animosity of some freedmen. Umbonius forthwith had all his possessions collected and exhibited, as though for sale ; he actually would only sell his senatorial robes, thus showing he had lost nothing of any consequence. Further members expelled could recover their rank under a new Emperor : Galba in 70 reinstated three who had been degraded by Claudius and Nero for extortion, and Marcus Antonius Primus thus punished by Nero for forgery.

III. THE KNIGHTS

Every senator was purely Roman ; his creation implied his release from all liability to his native town. Foreign senators, too, were to regard Italy as their home ; not as a mere sojourning : hence the regulations of Marcus Aurelius and Trajan as to investing one third or fourth of their property in Italian land. On the other hand, the knighthood was cosmopolitan, at any rate after Caligula, though many settled in Rome as members of the jury ; that monarch, to stay the diminution in numbers of that rank, included in it every eminent man in every province, an example followed by Vespasian. In the provinces, as in the *municipia*, the knights were the aristocracy, and their esteem may be understood from many inscriptions, e.g. that of one Manlia Secundilla in a city of Mauretania, whose brothers and *avunculi* were Roman knights : it was set up by her husband Quintus Herennius Rufus, who was also a knight. Provincials and municipals whose sons were thus dignified, would be as proud as knights who could boast of having fathered senators. Censorinus says in his dedication to Quintus Caerellius (238 A.D.), that his knighthood had raised him above mere provincials.

Of military origin, the knighthood became a wholly civic rank. In the later Republic even a knighthood signified little more than the qualification for service in the cavalry, and was practically hereditary. In 67 B.C. the Lex Roscia legalized the customary census at 400,000 sesterces, at which it remained in the Empire. Innocent or not, any falling below this sum forfeited the rank, together with its privileges of the gold ring, the purple stripe on the tunic, and the seats at the theatre. The father of Herennius Rufinus became bankrupt at Oea (possibly a relative of Quintus, or the same man) : ' he lays aside the gold ring and the symbols of his rank, and makes a composition with his creditors '. The grandparents of Statius the poet (at Naples) could not muster up the necessary sum, and his father, as a child, had to give up the purple and the golden *capsula*, which children of knights and senators wore as necklaces. ' You have for so long ', says Martial to one Macer, ' given rings to girls, that you have none left for yourself '. Spendthrifts lose their ring, and Pollio must beg with bare fingers.

In the Empire, too, knighthood was not hereditary: the censors, and ever more and more the Emperor, used regularly to grant the equestrian horse, though seldom to boys, save after the second century. The number of life-long grants was limitless. Even under Augustus at the annual parade of the knights (a custom maintained into the fourth century) on July 15, at which all entitled would not attend, five thousand took part in the ceremony.

The equestrian horse was generally bestowed only on families with an ancient title; but men of no birth could also have it, as Tiberius' stringent exclusion of freedmen's sons (23 A.D.) was soon relaxed: it is not strange then that sons of pandars, gladiators, fencing-masters (who might be free-born) in Trajan's day sat among the knights. But even freedmen, subject to a fictitious adoption, might receive from the Emperor the golden ring and the full rank. The first Emperors were sparing of these grants, according them only to those freedmen of theirs most deserving or most in favour. Of these enough has been said. Thus Augustus honoured Titus Vinius Philopoemen, who had sheltered his proscribed patron, and Menas, the deserter from Sextus Pompeius, and his physician Antonius Musa. Soon after Philippi, Horace's anger was stirred at seeing one of these freedmen strutting about on the *Via Sacra* with a *toga* six yards long, and driving on the *Via Appia* with ponies, sitting on the knights' benches in the theatre, and being a legionary tribune. More lavish were such grants under the Flavian emperors: Pliny says that, under Vespasian, men who were yesterday slaves, to-day might have leapt into the second rank; a thing unprecedented: the sign, whereby knights were distinguished from the free-born, now confused them with the unfree. Later on, before the beginning of the third century, perhaps soon after Commodus, the golden ring did not, except under special imperial license, carry with it full rights of knighthood, nor full *ingenuitas*. The standard of honour exacted varied. One claimant, presumably rebuffed in consequence of an action for calumny, on a second application, was told by Hadrian that those who desire the ring must be above suspicion.

Although a seat in the Senate was incompatible with the equestrian horse, the senatorial career regularly set out with

the knightly services and offices, both for senators' sons, and for young men adopted into senatorial families. Both classes of future senators wore the distinguishing senatorial mark, the broad purple stripe, and were a special division of the knighthood, provisionally included.

The knighthood had ceased long ago to serve in the army, but were still organized in *turmae*, and, as such, turned out on solemn occasions, such as funerals and the annual parade on July 15. The *seviri equitum Romanorum*, the six leaders of these squadrons, were appointed by the Emperor, mainly out of the senatorial knights, and the princes, who wore the *toga virilis*, but did not as yet sit in the Senate, led them as the *principes iuventutis*. To this limited extent the knights were an organized corporation, but the essential unity of the Senate they never had, nor was it ever ascribed to them.

Gaius Gracchus (122 B.C.) had conferred on the knights the exclusive right of being *iudices*: thus they were the only jury down to the end of the Republic (except from 80-70), and in matters civil and criminal under the Empire: from their ranks the lists were drawn. Augustus released the senators from the obligatory service on juries, enacted by the *Lex Aurelia* (70 B.C.) and by Caesar (46 B.C.), and assigned to the knights the first three *decuriae* of jurors (about one thousand in each). Augustus added a fourth, and Caligula a fifth, consisting of specially competent men, possessing half of the knightly census. The lowest age limit was fixed at thirty; by Augustus at twenty-five. Under Augustus only Italians were admissible, later on, Latin-speaking provincials (numerous instances are found in inscriptions for Africa, Spain and Gaul, very few for the Danubian countries and still fewer for the East): and, further, only citizens by birthright. Such were the jurors for the first two hundred years.

The legal qualification for service as commissioned officers was the proof of the conference of knighthood by the Emperor. In the cavalry service (*militia equestris*) there were, at least, three regular ranks: the praefecture of an auxiliary division, the tribunate in a legion or cohort (both ranking equally), and the praefecture of an auxiliary cohort. Under this head there also comes the stationary command (*praefectura castrorum*), and perhaps many other ordinary and extraordinary officers' posts. There were no age-limits, and military service was

less tied up than the civil. Further, soldiers who attained the highest centurionate of the legion, were often given the equestrian horse, and the entry of veterans into the officers' ranks was favoured in the Early Empire ; later, when government relied more and more on the populace, these veteran promotions fell into a class apart.

Augustus had made service as officers compulsory on the knights. After Claudius' reign, and certainly after 100 A.D., they were obliged to hold three officers' posts ; after Severus, four. The duration of the several services is uncertain ; they might remain several years in one. To be appointed to the six months' post of tribune or praefect (which was equivalent to a year's service) was an envied promotion. Senatorial knights, on entering the Senate at the age of twenty-five, lost the right of being officers, and only had to serve once. The Augustan order of seniority remained in force until about 250 A.D.

For a long time, service in the army was an essential preliminary for the equestrian civil service. Augustus entrusted to the knights all offices personal to the monarch, such as the finance, and departments of home and war administration, less noble and more responsible, besides the new provinces, auxiliaries and fleets. As procurators (superintendents of finance and administration), knights were used in Rome and in the provinces, and, even in the senatorial provinces, as receivers of all revenues ; in the imperial provinces, as principals of the fisc ; and, after Claudius, as independent administrators or officials with supreme criminal jurisdiction. The other procurators had jurisdiction only in finance, and this much only after Claudius. From such posts knights in the course of the second century gained access to the administration of the imperial household, formerly held by freedmen, namely the Secretariate, the Department of Grievances and Petitions, and the Treasury. The highest posts were the praefectures of Corn and the Police and Fire-brigade of Rome, the governorship of Egypt, and the command of the Praetorian Guards, which was divided between two praefects during the first two centuries : there were also the praefectures of the imperial fleets at Misenum and Ravenna and the imperial post. Soon after Tiberius' reign, the praefects of the Guard ranked first after the monarch himself, as the commanders

of his personal¹ life-guards, and often enough the makers and unmakers of their masters ; besides, they more and more represented the Emperor in criminal and civil jurisdiction. Thus this praefecture became a vice-Empire, and was viewed as the second greatest earthly power by the writers of the third century.

These high positions naturally only fell to the lot of the few, and to attain a procuratorship was no small honour. which raised the holder's family into the equestrian nobility. The career was very profitable, and the high salaries determined the ranks of this hierarchy. Fronto recommends the Greek historian Appian, who was then engaged in legal work at Rome, to Antoninus Pius for nomination into civil service : Appian, he says, desired the post, not out of ambition or desire of a high procuratorship, but to invest his old age with a position of honour. The legionary tribunate could be held at eighteen, and was generally entered on by young knights at or about this age : the salary was 25,000 sesterces (£270). One of Hadrian's reforms of army discipline was the forbidding of beardless tribunes. Salaries of procurators were proportioned to their rank and importance. The largest was 300,000, the income of the chief of the Finance Department, the chiefs of the Secretariate and the Petitions receiving only 200,000, as also the director of inheritances that fell in to the Emperor. The principal provincial procurators received 200,000 ; the others 100,000 or even 30,000. 100,000 was also the salary of the directors of the Privy Purse, the Mint, Roman waterways, the great school of gladiators, public buildings, the Food Commission, and the postmaster-general. Assistants, sub-procurators, and sub-praefects received 60,000, and also the clerks of the State Council, the under directors of the Imperial Literary Department, provincial postmasters-general, the procurator of corn at Ostia, and (in the second century) the professional director of all the imperial libraries. The salaries of praefects must have been gradated similarly to those of the procurators.

An equestrian career was as varied as the senatorial. A tablet dedicated to Lucius Valerius Proculus at Malaga (perhaps his native city) describes his career ; somewhere he was praefect of the cohorts and legionary tribune, then praefect of the flotilla of coastguards at the mouths of the

Nile, then procurator of the province of the maritime Alps (from Genoa to the Varus), and, at the same time, charged with the log of the legionary reserves, and then, in succession, procurator of Baetica, Cappadocia, Asia, and the three Gauls; and, after serving at Rome as head of the Finance Department and praefect of Corn (under Antoninus Pius), praefect of Egypt. Seneca's friend Lucilius, was, at the time of Seneca's correspondence with him, procurator of Sicily: he had been in service in the Graian and Pennine Alps, in Dalmatia and North Africa. The career of Pliny the Elder is incompletely known: he was born in 23 at Comum, in 45 led a division of cavalry in Germany; then, perhaps, became procurator in Spain; in 52 was in Rome amongst Vespasian's Friends; then held several procuratorships, one perhaps in Africa; in 79 died during the eruption of Vesuvius as commander of the fleet stationed at Misenum. His long career as advocate and his literary occupations must have precluded him from higher posts at the age of fifty-six, despite his Emperor's friendship. These officials might be very enthusiastic: one Gaius Turranius, who was dismissed by Caligula from his procuratorship at the age of ninety, lay prone on his bed, and bade his servants raise a *conclamatio* as though for a dead man. He was not satisfied, until put back into his old harness. As a contrast to such indefatigability, Sulpicius Similis may serve; he, under Hadrian, requested dismissal from his unwilling praefecture of the Praetorium, and lived his seven remaining years in country retirement; and inscribed the years of his life as seven.

The *centuriones primipilares*, as has been said, could get an officer's commission, and enter on the official career; but there were none immediately admitted before Marcus Aurelius, and, after him, instances are rare.

'On the one hand, during the second century, more and more stress was laid on military service, and, in the third, the civil service was an epilogue to a long military career, and the administration treated as a provision for officers past service; on the other hand, a purely civil service grew up, leading to the same posts of procurators and praefects.' Hadrian's thorough reforms increased the numbers in the various branches of the service; freedmen were now, on principle, excluded from subordinate posts: hence the larger

demand necessitated a less vigorous qualification, as the officers who had served their time would be too few. Hadrian created a civil service, independent of the military, and with it an officialdom conversant with the facts and the rote of business. The apprentice stages were various : subordinate posts in the Food Commission, the Highways, the Inheritance-duty, the Imperial Fencing-schools, the levying of recruits, Roman public libraries and the Literary Office. A legal training was a great recommendation to promotion, considering the expanding jurisdiction of procurators and praefects. Hadrian organized his Council (*consilium principis*) principally out of professional jurists, especially of knights, for legal purposes of all sorts, and the praefecture of the Praetorium was totally changed, for 'jurisprudence took a foremost place, no longer the counterpart and complement of military service, but its full equivalent'. Even before the third century, knowledge of law had been the principal requisite for the praefecture of the Praetorium ; its holders had been the great jurists Paulus, Ulpian and Papinian, and Herennius Modestinus had been praefect of Police. Volusius Maecianus, the counsellor of Antoninus Pius, and the Friend of Marcus Aurelius and Lucius Verus, was probably praefect of Egypt, or judge in Alexandria ; Tarrutenius Paternus, under Commodus, had been praefect of the Praetorium. Equestrian jurists commenced their official career as paid assessors to provincial governors, pleaders to Praetorian praefects, assistants in the Council of State, lower officials, or in the Attorney General's Office (*advocatus fisci*), established by Hadrian, to aid the procurators in contentious cases relating to the fisc. Septimius Severus came of a knightly family at Leptis in Africa, was entrusted with this office by Marcus Aurelius, and soon made a senator ; his successor as *advocatus fisci* was Papinian, who was in the same reign promoted to be head of the Department of Petitions and Grievances, and afterwards praefect of the Praetorium ; he made Paulus and Ulpian his assessors. Opellius Macrinus, after his knighthood, also became *advocatus fisci*, and apparently ascended the official ladder in the usual way up to the praefecture of the Praetorium ; previously he had been procurator of the Privy Purse. Probably in the second century, amongst jurists of equestrian rank, members of the imperial council could be

chosen from amongst former distinguished Attorneys General, and then further promoted. A fragmentary inscription informs [us that a jurist of the third century first became imperial councillor at a salary of 60,000, then held a priesthood; and, after that, received 100,000 sesterces; he was afterwards appointed Commissioner of Food for the Via Flaminia (from Rome to Rimini), postmaster-general, and, at the last, imperial councillor at a salary of 200,000. Law might pave the knights' way to the Senate; e.g. Lucius Fulvius Aburnius Valens: this must have been frequent in the second century.

An edict of Marcus Aurelius and Lucius Verus divided equestrian officials into three classes: the first was the praefecture of the Praetorium, its holder being styled *vir eminentissimus*; the second, all other praefects (including the heads of the Finance and Petitions Departments) with the title *vir perfectissimus*; thirdly, all *procurators*, called *viri egregii*. Beneath them were the knights not in the service, the more eminent of whom were styled *splendidi* or *illustres*. *Viri eminentissimi* and *perfectissimi* down to the third generation were privileged in criminal procedure, in action and in penalty. These titles, unlike the *clarissimate*, seldom, if ever, were hereditary.

Knights often held the principal subordinate post, influential and well-paid, of *scriba* or book-keeper to the aediles and quaestors. Horace, who had been legionary tribune, bought himself such a position, as did Sarmentus, who, under Augustus, played a knight's rôle. Non-equestrian officials of this class were often made knights.

By the Augustan regulations the priesthoods of the *Curiones* and *Luperci* were tenable by both knights and senators: knights had exclusive right to the lesser *Flaminatus*, the *pontificatus* and *tubicinatus* and all Latin priesthoods, of which the *Caeninense* was the most important and the *Laurentinum* the least; this last knights of no standing, and (after Commodus) even freedmen might often hold. These priesthoods were esteemed as imperial favours, and valuable as conferring certain immunities.

Knights entitled to be senators often preferred to remain in their own order, so as to enjoy either the leisure of an unofficial life, the large profits of business, or the reality of

power in office or at Court, rather than have the tinsel glory and burdensome pomp of the senatorial dignities. Thus Quintus Sextius Niger declined the broad purple stripe offered to him by Julius Caesar, to live the philosophic life. The rejection of senatorial rank and precedence was a sore point with these haughty aristocrats. Tacitus the senator characteristically reflects on Lucius Annaeus Mela, the brother of Seneca the philosopher and father of Lucan, that his perverse ambition withheld him from competing for the Curia, so as to have equal influence, as a knight, with consulars; also, to make his imperial office a shorter cut to a fortune. Cornelius Fuscus, in early youth, had abandoned his senatorial rank 'for pelf'. On the other hand, Pliny the Younger praises some knights, unambitious, money-loving, or perhaps merely idle. Minucius Macrinus was raised by Vespasian to the rank of praetorian senator against his will; he preferred the leisure of the knight to the troublesome dignity of senator. Maturius Arrianus and Terentius Junior were of the same opinion. How knights were ennobled (the first instance being 19 A.D.) has been described.

Apart from these gradations, knights differed much in social position, income and family. All self-made men, risen through favour or military merit, were looked down upon by those who had, if not long knightly lineage, at least an inherited rank. 'Roman knight and son of a Roman knight', so runs an inscription at Misenum on Lucius Aemilius Pertinax Acceianus. Ovid gloried in his ancestral dignity; his knighthood was no mere personal desert of war or fortune; Persius pronounces it no reason for boastfulness in being able to strut past the censor at the Parade in the *Trabea* (the knight's robe) and being the thousandth scion of an Etruscan family.

The difficulties and indignities of knights too poor for their station, or too idle or incompetent for work, are dealt with in Martial's poems: he owed his elevation to his tribunate. He was always being referred to the favour of rich patricians, and never stickled at begging from them or the Emperor: his wishes were modest, he requested a good cloak and a fine *toga*: this last he received from Parthenius, the imperial chamberlain, and he sang his gratitude in two poems, to celebrate its newness, and mourn its shabbiness. To earn

his daily bread, year in, year out, he condescended to the lowest cringings of a client. His Muse was suborned to every man ; one of his most belauded friends, Pudens the centurion, never even attained his aim of knighthood ; Martial also wrote epitaphs for other centurions. The 400,000 sesterces scarcely supported life. Juvenal says they were a living wage and no more ; but, if double or treble the sum did not suffice, then the wealth of a Croesus or Narcissus would not. Some Roman knights had to live on bran-bread and sour wine ; and the many, who under the Julian Emperors disgraced their order by public acting and combats, can scarcely have so done, save under hardest pressure of need ; amongst those knights who appeared in Nero's spectacles, only a few were reputable and rich.

But there was also great wealth, in the provinces, the *municipia* and in Rome ; thus Persius the poet, of a Roman equestrian family at Volaterrae, left 2,000,000 ; Columella, probably a knight, of Cadiz, possessed land at Caere, Ardea, Carseoli and Alba. Vedius Pollio, the friend of Augustus, and owner of the great estate of Pausilypum (Πανσυλπιον), now Posilippo, was descended of freedmen ; his vast palace at Rome, 'larger than many cities', was, after his death, demolished to construct the Colonnade of Livia. Generally, the Emperor's equestrian friends were very wealthy. The bankers also belonged to this class—Augustus once as censor admonished them for borrowing at low rates and lending at high—also merchants (mostly engaged in sea-trade and shipping), manufacturers, tax-farmers, purveyors, directors and partners in companies and mercantile enterprises (e.g. the providing horses for the Circus). Seneca speaks of a 'splendid' knight, Cornelius Senecio, whose ability in business had enriched him, and whose death cut his career short : his money was invested on land and sea ; he found no industry amiss, and also farmed taxes. But investment was mostly in land. According to Quintilian, most of the jurors were landowners. The advocate must not seek terseness at the cost of intelligibility, or they would not follow his arguments.

Men unqualified often posed as knights. At the Court of Augustus one Sarmentus, an Etruscan, a freedman or a slave (according to Horace, of a lady, according to others of Marcus Favonius, who died at Philippi), gained so much favour with

his wit that he could appear as a knight. Once, when sitting at the games in the equestrian benches, the populace sang jeering songs at him. A trial for unlawful assumption of the title ended, thanks to his supporters, in an acquittal. In 23 A.D. Gaius Sulpicius Galba, as aedile, complained in the Senate that even publicans wore the golden ring; this was forthwith forbidden and the prohibition sharpened next year by the *Lex Visellia*. During the censorship of Claudius (47 A.D.) the knight Titus Flavius Proculus prosecuted no less than four hundred persons, freedmen having their property confiscated as well. Under Nero few freedmen dared so presume: Trimalchio, in Petronius, wears a ring half-gilded on one side, and on the gold set with iron stars. Martial never mentions such proceedings: but often speaks of Domitian's Edict (circa 89), prohibiting unqualified use of the equestrian benches, a practice condoned up to then. But richly dressed men, loudly commending these ordinances, would still intrude in these seats; they were recognized, and removed, and 'knights could at last sit at ease, and in their proper dignity, free from the pressure of the vulgar'. Martial and Juvenal use the expression *vernae equites* for such false pretenders, and they must have been a standing feature of Rome. Martial wrote an epigram on a barber who was decked by his mistress with a knight's feather, was accused, condemned and fled to Sicily.

IV. THE THIRD ESTATE

§ 1. RICHES AND POVERTY

Rome was mainly peopled by the 'third estate'; in this class the proletariat formed the majority; it lived on the '*panem et circenses*', the generous distribution of which was ever inflating its numbers. The great distributing of corn gave only the majority of the male freemen the barest livelihood, and thus in the over-big over-rich city, there was also poverty and need. The poor man, says Martial, may well be a Stoic, and despise his life; it was no merit of his. Their dark rooms, two hundred steps up, were not as high as a man's stature. Their hearth was cold, a jug with a broken handle, a mat, a heap of straw, an empty bedstead, was their furniture; a short *toga* by day and night their only

protection against the cold ; vinegar-wine and black bread their food. Bread, beans and turnips (the workman's lunch), lentils, onions, garlic, peas (one *as* bought a good meal), and fish, were their diet ; leeks and a boiled sheep's head, or a smoked pig's head, was luxury. On July 1, the usual day for moving, many poor families might be seen, driven out by the estate-agent, after he had taken all their best property in distraint ; with what was left they were sent into the street, 'a first of July disgrace', says Martial. A pale-faced man, exhausted with frost and hunger, the 'Irus of his day', and three women more like *megaeras*, dragging a bedstead one leg short, and a table two legs short, and other rubbish, a horn lamp and lantern, broken crockery, a rusted coalbox, a pot stinking of fish, an old wreath of black fleabane (esteemed a cure and hung up in bedrooms), a piece of Toulouse cheese, string to support the absent leek and garlic, a pot filled with a cheap depilatory. Why should they seek a dwelling ? the poet asked ; they could live free on the bridge. Bridges, steps, thresholds, inclines, were, as in modern Rome, the beggars' resorts : there, and in the *fora*, their picture of woe, their rags, and their maims and wounds (blind men led by a dog), sought to awaken pity : their hoarse voices intoned petitions for alms. Their refuge in the cold rain of December might be an open archway ; their dog their sole friend, and their food dog's bread (bran-bread) ; their wealth a staff, a blanket or a mat, and a knapsack ; their salvation solitary death.

Not all the poor were so poor. Some might be well off, by some vicissitude, such as raised slaves. Clesippus, a hunchbacked ugly slave, who had learnt fulling, was bought by Gegania at auction as part of a lot with a Corinthian candelabrum ; he became his mistress' lover, and her heir. When a rich man, he worshipped, as his god, his saviour candelabrum. Such careers were not rare under the Emperors. Licinius Sura, the friend of Trajan, had a love-boy Philostorgos, whose wealth irritated a friend of Epictetus ; the philosopher rejoined that Fate was not to blame, but he would not purchase wealth at that price. Juvenal had to see his former barber become owner of many country-houses, and be as rich as a lord ; and Martial look on at a freedman shoemaker, who used to pull up old skins with his teeth, living in luxury on his former patron's Praenestine estates. Former horn-players

R.L.M.

L

in gladiatorial touring companies often themselves came to give gladiatorial games, as also did, under Domitian, a shoemaker at Bologna, and a fuller at Modena. (Modena was a centre for fulling and wool-making). Such pieces of luck were few: but often did dirty dealers or auctioneers make more than advocates. 24,000 sesterces seems to have sufficed for a modest livelihood for one. Juvenal's Naevolus wishes for 20,000, and a little silver, not finely wrought, but not too simple, two strong Moesian slaves, to clear his way to the Circus, and two skilful artisans, to earn him something. This poverty would be bearable.

§ 2. INDUSTRY: CRAFTS AND TRADE

There was no unemployment at Rome for the willing worker, however poor. There was no export trade, and little manufacture, except perhaps of some military articles: a union of such catapult-makers is known of. The imports were enormous, and Rome was the principal exchange of the world. Transporters of wares on the river, which Pliny calls 'gentlest bearer of the world's traffic', stevedores, warehouses and their staff, the many middlemen, employed thousands as sailors, divers, weighers, clerks, agents, commissioners and porters; and in the exchange, besides the great bankers, there were many little money-lenders. The usurer flourished in Rome. Ambrosius' description may well literally be antedated: in him, usurers systematically fleeced rich young men; either by loans, or by inducing them to purchase valueless goods: they would lend on old family estates, and dun hard, if necessary, exacting newer and severer terms.

The underlings in trades and crafts were mostly slaves and freedmen working for their master, possibly on commission. The rich supplied many of their own needs through their slaves. A Yorkshire inscription in a tavern runs: 'Hail, oh god of this place; slave (*servule*), be zealous at your goldsmith's work in this inn'. But the need of providing the huge population with the necessary living wage, and the various and exigent luxuries of the rich, kept many independent handicraftsmen and dealers at work. But most of these even must have been freedmen, as the slaves would live

for themselves on what they had learnt for their masters, and as the poor free contemned such employment.

Scanty as the sources are, the crafts and trades of Rome may be reconstructed. The gazetteers of the early fourth century mention 254 bakeries (fifteen to twenty per *regio*, and twenty-four in one) and 2,300 oil-shops. Foodstuffs gave employment to thousands: and there were special markets for cattle, pigs, corn, vegetables, fish and delicacies; clothing-trades, dwellings, furniture were also amply catered for.

The complex division of labour incident to highly developed industrialism entailed a large populace engaged in the trades and the crafts. Many such workers of single articles formed guilds. From the ancient guild of the shoemakers, dating back to Numa, there had seceded the bootmakers' guild, which Alexander Severus reorganized. Sandal-makers there also were sufficient to name a street, slipper-makers, ladies shoemakers and other specialists in this craft, all similarly organized. Trajan reorganized the bakers' union, and, besides this, many special pastries had their proper guild. The copper-smelters were specialized into potters, makers of candelabra, lanterns, weights, helmets and shields: the ironmakers into fabricants of locks, knives, axes and hatchets, scythes and swords. Under Augustus a guild of ladder and stepmakers (*scularii*) had been formed. The restoration of works of art in metal busied modellers, founders, polishers, gilders, sculptors, chisellers and machine-workers; jewelry workers in pearls and diamonds; besides the guilds of gold and silversmiths, there were ringmakers', goldbeaters' and gilders' unions. St. Augustine compares the lesser gods, with their very limited power, to the craftsmen in the Streets of the Silversmiths, where every completed work has passed through many hands, where the mastery of the whole is hard to learn, and the special part easy. As in the nineteenth century, colonies of similar workers congregated at Rome and elsewhere in Italy in special districts.

The division of labour was most complex in art: the enormous demand for the unique products resulted in a large manufacture of them. The mural decorations of Pompeii, as also at Rome and elsewhere, point to decorators' guilds, in which painters of houses, of arabesques, flowers,

animals and scenery worked together. In the sculptors' yards of Rome (mostly in the ninth *regio*, between the *Porticus Europae*, the *Circus Agonalis* and the *Via Recta* ; also perhaps near the marble-wharves) statues were often transformed, even new heads put on : in the Pandects it is observed that a legacy of a statue held good, though an arm had been substituted before the testator's death. Tombstones were a special branch of work : in Petronius Habinnas is a stone-worker, of whom Trimalchio orders his monuments. In the Pandects a partnership for restoring gravestones is mentioned, one member giving the capital, and the other his ability. Some workers specialized on *genii*, their yards stood behind the Temple of Castor ; and others in eyes of some coloured material. This manner of production, together with the frequent employment of slaves, led to a great cheapness of statues, portraits ranging up from 3,000 sesterces. Similarly, expanding trade caused specialization : thus, lupine-sellers were a special branch of vegetable-dealers : in drugs, colours, salts, essences, toilette accessories, there were many special guilds ; and so, too, amongst the tailors for cloaks, mantles, summer garments, etc.

These very heterogeneous industries were carried on in the most frequented parts : at the end of the first century the nuisance of the shops which projected from the house-fronts had to be inhibited. Streets were named after their occupants, e.g. the streets of the corn-merchants, harness-makers, sandal-makers, wood-traders, glaziers, salve-dealers, scythe-makers. Such congregation was no doubt involved by the specialized labour, as St. Augustine observed. The *Via Sacra*, one of Rome's principal highways, was the Bond Street of Rome, containing, according to inscriptions, besides purveyors of luxury, jewellers, metal founders, and sculptors, a dealer in colours, a flute-maker, and a writing-teacher. Ivory dice might there be bought, and ' Caietan ' cord (really from Gaul), crystal balls, peacock feather fans, and other ladies' articles, fruit for dessert and crowns for the toppers at banquets. Rome's best shops, however, at about 100 A.D., were in the markets, surrounding the *Saepta* of the Campus Martius. There fine slaves were to be had, large citron-wood table-tops, ivory, banquet couches inlaid with tortoise-shell, ancient bronze statues, crystal and *murrha* vessels, silver beakers of

antique design, collars of gold set with emeralds, big pearl earrings, as well as less expensive wares. Other shops for luxury were in the *regio Tusca*, and in the arcades surrounding the Circus.

The shops and taverns in all their breadth opened on to the street, and were closed in with linen curtains, covered with notices or paintings: they also had signboards. Some tablets in relief have been preserved, which were either signs, or they may have decorated the shopkeepers' tombstones. On a ham-dealer's sign, there are five hams ranged arow. Two of these advertise two branches of a tailor's firm for men and for women; the design is a man or woman and their retinue examining proffered articles. One such sign represents a hare, two wild boars, and several large birds hanging on the wall; and a young girl bargaining with the mistress of the shop; both figures' costume, bearing and execution show the refining influence of Greece, like other examples, such as funeral monuments, which testify 'how much more general than in modern days, even in later antiquity and the lower ranks, was the need of beautifying life by art, and leaving posterity some record and remembrance'. Thus workmen would have tombstones depicted with scenes from their lives; there is one relief, a well-known group of the three Graces, and a matron fully clothed, her dress drawn over her head: the inscription is '*to the four sisters*'; it must have been the sign of a shop or inn, or, maybe, bawdy-house. A Greek-Latin book of dialogues contains the following: 'I am going to the tailor. How much does this pair cost? One hundred *denarii*. How much is the water-proof? Two hundred *denarii*. That is too dear; take a hundred. Impossible; I have to pay so much for it wholesale. What shall I then give? What you like. [To the slave or attendant] Give him 125 *denarii*. Shall we go to the linen-merchant?' Bargaining was customary, as Juvenal witnesses: a schoolteacher must expect a deduction from his salary, like a dealer on his rugs and bed-linen.

It is almost only from such reliefs and inscriptions that we get some insight into the lives of these many workers. They remind us how little we know: one inscription at Hierapolis in Great Phrygia of the second or third century, records a society of purple-workers founded for mutual support,

another in Sardes, 459 A.D., a quarrel—such as frequently arose among the Mauri in the Eastern Empire—between men and masters (*ἐργοδοῦναι καὶ ἐργολάβοι*): the former had discontinued a building-operation. The Roman *mimi* and *atellanae*, which borrowed their scene from these social strata, are unfortunately lost, and Petronius' *bourgeois* are South Italian only. The extant literature is entirely from a sphere which had more contempt than interest for the lower orders, the men who, day by day, tucked in their tunics behind the counter, or stood in apron and cap by their bench in the workshop, where nothing noble could be made, only the daily bread earned—where cheap goods were sold at 50 per cent. profit, be they hides or fragrances; for them profit was the best of scents. People of higher standing were no more connected with even the uncleanest business (e.g. the letting of houses and property for brothels) than are Russian grandees with the cheap spirit-stills; the transaction of such affairs by slaves and freedmen left them untainted: little tradesmen were taunted for their innocent cupidity. Pliny says that tailors watched the sinking of the Pleiades, on the 11th November, to see if it were cloudy—a sign of a rainy winter—or bright—a sign of a rough winter; and to judge whether to raise the price of cloaks or underclothing: he sees in this a cheating disposition. Workmen received, if satisfactory, a small extra wage called *corollarium*.

Workmen and small tradesmen were the most conservative class, as every revolution, riot, or civil war spelt their ruin. Cicero, enunciating a sempiternal truth, says: 'Most of the innkeepers desire peace. Their livelihood depends on their custom, which involves calm: every time they are closed, they lose, and what if they are burnt down?' This was what happened in street fights. In the combat between the people and the Praetorians, 237–8, the latter, pelted from the roofs, set fire to the closed doors of inns and houses. It was usual to see in inns, shops, workshops and offices badly executed busts, almost caricatures, of the reigning Emperors. On the imperial birthdays and festivals in the Emperor's honour, and other occasions, taverns were decked with laurels and lighted up: on days of imperial mourning they were closed.

The medieval guilds had their patron saints; the Roman

their tutelary gods with their holy days. Most general was the 19th March, the foundation day of the Temple of Minerva, protectress of all craft and art guilds, on the Aventine : later on, the festival was prolonged till the evening of the 23rd March. According to Ovid, spinstresses, weavers, fullers, painters, shoemakers, sculptors, doctors, schoolmasters (and their pupils had holidays) took part in it. The 9th of June (the Day of Vesta) was celebrated by millers and bakers ; donkeys were wreathed with flowers and loaves, and mills were garlanded. The guild of musicians (especially flautists), who played at acts of public worship, had their feast in the Temple of Jupiter on the Capitol, and, on the 13th June, crossed Rome in masks and disguised (generally in female garb), intoxicated, singing parodies set to ancient tunes. At such industrial festivals processions were common : one picture at Pompeii represents a procession of carpenters, and figures of men sawing, and others similar were carried about by the younger men. At Rome and elsewhere the guilds had a regular part in great processions, such as triumphs and imperial arrivals, and flaunted their flags bravely : no doubt they had their own banner bearers. A marble tablet found at Ostia contains a monthly list of members of an association (one a woman), and their contributions, the interest on which, at 12 per cent. went towards a common celebration of all their birthdays. One general festival of the common people (March 15) was the day of Anna Perenna, a goddess of the year, held in an orchard at the first mile-stone on the *Via Flaminia* (not far from the Porta del Popolo). The girls sang very free satires of ancient origin ; men and women lay down together on the grassy shores of the Tiber, in the open, or in huts, or improvised tents of reeds covered with their *togas*. There they had drinking-bouts, and prayed for as many years as they drew spoons from the bran-pie ; sang theatrical ditties, capered about, and returned home, riotously supporting one another, the mockery of all who came their way.

The guilds also provided for funerals : but most of the poor, who could not raise the money for their own burial, contributed monthly to death-funds, which admitted free-men, freedmen and slaves, and assured the members proper exsequies, generally in the *Columbaria* : these were huge vaulted buildings with rows of pigeon-holes. Such associations

also had their standing festivals, and celebrated the birthday of their patron deity (the dedication-day of his idol) with a banquet. Amongst the extant statutes of such associations, those of the 'Adorers of Diana and Antinous' at Lanuvium ([Città Lavigna]) of 133 A.D. give an interesting glimpse into the nature of these mortuary guilds, and an idea of their festivals. By way of preface is the warning: 'Do thou, novice, first read the statutes, and have heed not to encumber thyself or thy heirs'. New members paid an entrance fee of 100 sesterces, and an *amphora* of good wine: the annual contribution of fifteen sesterces was paid in monthly sums of five *asses*. 300 sesterces were allowed for individual funerals, except for suicides, fifty being reserved for the procession and distributed at the pyre. Grievances were to be dealt with at general meetings, so as 'on feast-days to carouse at ease'. Carousals were organized by four members appointed for every year; they had to provide covers or pillows for the couches, hot water and dishes and four *amphorae* of good wine, and a loaf of two *asses* and four sardines for every member. The expenses of the meals were probably met out of the interest of a capital sum given by some benefactor: wine could scarcely have been insufficient, as besides initial contributions, slaves on manumission had to give an *amphora*. There were six drinking-bouts a year; at the two principal ones, the birthdays of Diana and Antinous, the president, who was elected for five years, and received double portions, had to distribute oil at the public bath before the banquet. He also had to offer wine and incense at all feast days. At the end of his term, if he had administered well, he received one and a half times his share. Any one, who, at a feast, quarrelled and left his seat, was sconced four sesterces; any one guilty of abusive language, twelve; any one who insulted the president, twenty. When Christianity made inroads among these small tradesmen, many would not immediately renounce the benefits of these associations. In the letters of Bishop Cyprianus of Carthage, one Martialis is accused of 'frequenting the disgusting banquets of an association and by its means burying his children in heathen fashion in unhallowed graves'.

Indications are to hand of social and intellectual culture in this class, naturally not over great; as the bad grammar and spelling of their inscriptions show. In Gellius, a gram-

marian calls an unknown word 'plebeian and vulgar'. Yet lines from Virgil, whose popularity perhaps exceeded Shakespeare's, were in every one's mouth, 'abused and misused. A sign of a venison-dealer is inscribed from the *Aeneid* :

Whilst shadowy mountains
Rise to protect wild deer and stars circle still round the Pole-star,
Ever shall live thy name, thy honour, thy glory, eternal.

They also attempted original verse. One inscription laments the loss of a thirteen-year-old slave, the darling of his master, probably a goldsmith :

Skilled was his hand in the art of finishing necklaces finely,
And to enclose in hand-wrought gold bright glittering jewels.

Their manners, no doubt, left something to be desired. Hucksters in salt-fish were said, by a Graecism, to snuffle with their elbows, and their boys were unusually vulgar. Masters not unfrequently abused their disciplinary powers against their apprentices, even if free; one such clumsy pupil had his eye knocked out with a last. In the civic life of Pompeii, apprentices were not insignificant. Amongst the city election placards posted on to the walls, there is one written by the apprentices, and another by one Saturninus, '*cum discentes*' (sic). Some inscriptions on graves faithfully record the good qualities of the deceased. One freedman goldsmith, 'a master-maker of Clodian jars', is eulogized by his patron, as one 'who insulted no one, never thwarted his patron. He always had a mass of gold and silver and was never avaricious'. The tombstone of a freedman pearl-dealer on the *Via Sacra* begs the passer-by not to injure the grave where the bones of a man rest who was good, merciful, and a friend of the poor. One Lucius Nerusius Mithres, according to the hexameters on his tombstones, which are an acrostic of his name, was well known in the Holy City for his conscientious business habits as a goat-skin dealer, and for having, as a contractor, rendered all his dues to the fisc, and made equitable bargains. He had prospered, built himself a marble house, helped the indigent: and his great desert he deemed his building a burial-place for all his freedmen and freedwomen and their heirs.

Workmen often made an extra income by rearing and

training birds, though necessarily in competition with professional rearers. Manilius mentions trainers who traversed the town with caged birds, all their possessions being one sparrow. In these accounts, few as they are, workmen are several times mentioned as owners. A poor shoemaker had trained a raven to congratulate Augustus: the purchase was declined, as Augustus had sycophants enough already: but the bird repeated at the right time his master's complaint: 'All my trouble's gone for nothing', and was bought at a high price. A barber on the Forum had a magpie, which imitated musical sounds and men's and animals' tones: one day a stately funeral procession stopped in front of the barber's house, and the *tuba* blowers played a long piece. The magpie was silent awhile; envious magic was suspected: then she sang the whole of the funeral music from beginning to end. In the reign of Tiberius a raven flew out of a nest in the Temple of Castor into a shoemaker's opposite, and the master taught it speech. The raven learned to fly every morning to the rostrum, to address Tiberius, Drusus and Germanicus by name, to greet other passers, and was the wonder of all Rome. The owner of a shop near by killed it (on the pretext of anger, as it had dirtied a pair of new shoes), and the enraged people drove the murderer out of the district and afterwards murdered him. The bird was solemnly borne by two Moors to a pyre on the Via Appia, followed by a multitude with wreaths. Pliny, on the authority of the *Acta diurna*, dates this on the 28th March, 35.

§ 3. MISCELLANEOUS CRAFTS, ARTS, AND PURSUITS

(i) General

Not only handwork and shopkeeping, but many other, often profitable, businesses were considered ungentlemanly. The poor free-born man of liberal education spoke contemptuously of men who grew rich by the undertaking of funerals, bakeries, bathhouses, the farming of river and harbour dues, public works, the clearing of the *cloacae*, or as auctioneers of rubbish or priceless wares, and through other businesses.

Two employments were so vile as to disqualify (by a law of Caesar's) for election to city offices: those of undertakers and public criers (*praecones*). *Praecones* were used for all

purposes of publicity, e.g. to proclaim lost articles, runaway slaves ; but their main function was auctioneering, and the close connexion of this business and that of the public jesters may have caused their disrepute. But this fact made it very profitable : for public auction in Rome included, in part, our commission-agencies, which effected the sale of the superfluities of an inheritance, or the raising of a sudden loan. In the stead of the business-man, a professional middleman came in, the *coactor argentarius* or *exactionum*, so called from his having to dun for single demands : a profession in general disesteem. For his trouble and risk he received 1 per cent. on the price : and the quantity of the work explains the lowness of the rate ; it might be more in especially troublesome business. Horace's father had been a *coactor*, and profits were then as low as those of a public crier ; but by about 50 A.D., in consequence of greater facility and promptitude in transfers, both made larger profits. Strabo says houses were constantly changing hands. Arruntius Euaestus, an auctioneer who angled successfully in the troubled waters after the murder of Caligula, was (according to Josephus) as rich as the richest, and powerful then and after. In Martial a maiden is wooed by ten poets, seven lawyers, four tribunes and two praetors, and, without further thought, espoused to an auctioneer. Nor foolishly. A boy, if he is to make his way, ought not to study or poetize ; rather should he ply the cithar or flute, or, if long-headed, the hammer or architect's rule.

Architecture Cicero collocates with medicine as a useful art, and of all arts the most respectable : it was also the most profitable. Under Augustus (according to Vitruvius) even the profession was so overcrowded that they had to advertise themselves, and many were incompetent. The demand increased owing to the numbers of erections, public and private, necessitated in part by fire and collapse, in part by the building mania of the rich : the smallness of the city was compensated by the endless possibilities of the country.

Excepting for some famous and highly paid artists, little is known of the despised sculptors and painters. Musicians might make much : the economical Vespasian paid Terpnus and Diodorus the citharists 200,000 for their performances at the rededication of the Theatre of Marcellus. Teaching

was profitable: and the salaries of distinguished singers and citharists awoke the envy of the learned. 'Learn', says Juvenal to the rhetorician, 'the fee Chrysogonus and Pollio make for teaching rich children the cither, and you will tear up Theodorus' manual'. Nero and Domitian patronized music more than any others. Under Domitian Martial wrote as above, and that he was going to return from Forum Corneliai to Rome, as a citharist. Art, too, like music, paid well, if popular, especially acting and dancing, and also fencing and circus-driving.

The learned professions were relegated, like the arts and their appliances, to the third estate, or to slaves. Galen selects, as noble departments, medicine, rhetoric, music, geometry, arithmetic, accountantship, astronomy, grammar, and law; to which sculpture and painting may be added. The last two, as employments, brought in the quickest returns: hence Lucian was apprenticed to his uncle, the sculptor. The learned professions required laborious and unremunerative preparation for years, and 'hard it was, for men in poor circumstances, to rise' (Juvenal). There is some information as to their position in life.

(ii) *Teachers, Rhetoricians and Advocates*

During the first centuries, the teaching profession had no assured position, nor the esteem of an official security. Education was in the Early Empire not regarded as a matter of State, and, in the second century, to a very slight extent, being, if anything, municipalized. Up to then education was a private concern, and only fostered by the immunity of teachers from town rates. This is confirmed by a communal decree, recently discovered, in South Portugal; there a school was maintained or being proposed. Elementary schools must have existed even in small provincial towns; only the larger cities had secondary schools in the sciences, or in the highest subject, viz. oratory. Hence children were sent to a larger town or to Rome for a good education. The school, kept by the elder Statius at Naples, received pupils from Lucania and Apulia; the school of one Flavius in Venusia, to which the big boys of influential centurions daily went with their slates and pencases, could not satisfy the paternal care of Horace's father: despite his poverty, he sent his son to Rome

to be educated along with knights and senators. In the first years of Trajan, Como, having no teachers of rhetoric, had to betake itself to Milan, until Pliny the Younger proposed to contribute one third, together with the families interested, so as to pay a teacher at his native Como. He could not quite consent to promise the whole amount to the town, as municipalized schools were often in the gift of electioneering committees. As in this case, applicants used to go to Rome to gain practice, and, armed with letters from the great men of Rome, give public exhibitions of their ability to speak and to teach, in competition for the post. Gellius was present at such a probationary recitation at Brundisium of a Roman-trained orator. He read out a passage from Virgil very badly, and asked the listeners to question him. One of Gellius' questions completely nonplussed him.

Antoninus Pius assigned salaries, payable by the communes, to rhetoricians and philosophers in all of the provinces, and enacted their immunity from civic burdens in a decree; nominally applying to the League of Cities in Asia, but really to the whole Empire. In the larger cities there might be ten physicians, five rhetors, and five grammarians; in the smaller, seven, four, and four respectively, and in the smallest five of the first, and three of the two last. This allowance was obviously marginal, and wholly insufficient for cities, like Ephesus and Smyrna, two of the largest in the Empire; hence in rhetoric and grammar alone, these few official teachers must have been largely privately supplemented. Gellius often speaks of grammarians, in great repute at Rome as teachers, and never refers to the official teachers: were there any such in the *Athenaeum* founded by Hadrian, they must have been incommensurably few in comparison with the private tutors. And the public positions in the other cities were much sought after. The tombstone of a Latin grammarian at Tritium Magallum in Tarragonese Spain mentions as an extraordinary fact his official appointment by the city at the age of twenty-five. Teachers might also receive decorations, as did a Latin grammarian at Verona, a knight who was given the *insignia* of a *decurio*.

The grammarians, or teachers of the two languages and the poetical contents of each, often took single pupils and resident posts, or kept private schools, as the more prominent of them

usually did ; as Quintilian says, they deemed themselves worthy of a larger theatre, and left mere pedagogy to the weaker brethren. But, for high fees, they would also take private pupils. Marcus Aurelius was ever grateful to his great-grandfather for his never having been to a public school, and for having had such a tutor, on the true calculation that, for this purpose, no expense could be too great. It was always men of lower standing who took up the teaching profession ; and at Rome, freedmen, *peregrini*, provincials, who, consequent on Julius Caesar's grant of the franchise to teachers, flocked thither. Many of them came from Greece and the East, as Greek was eagerly learnt at Rome.

Most of the teachers followed no inner call, but only the need of bread, as may be gathered from the fact that, of the most famous and learned grammarians or philologists of Rome in the first century, several (on the authority of Suetonius) only chanced on this occupation, or came to it as a makeshift. Many built up their knowledge, as slaves or freedmen in the service of erudites, or as pedagogues accompanying a boy to school. The famous Orbilius had been servant to a magistrate, and then served in the foot and the horse. Marcus Valerius Probus of Berytus, who was even more renowned, only took to linguistics after losing every chance of a subaltern's post. A third had begun as a prize-fighter, a fourth as a clown. Pertinax, the future Emperor, however, the son of a freedman wood-dealer, exchanged this profession, unsuitable to him, for military service.

It was universally held that a teacher's bread was hardly won. Ausonius says that no grammarian was ever happy, and that an exception to this rule would be an offender against grammar. The work and conditions were severe, the gain scanty ; few were those consolable by the feeling that it was a lofty and royal calling ' to instruct the witless in good manners and holy knowledge '. The lessons began at or before day-break : the teacher had to be up and about, long before the smith or the weaver, to breathe air sullied by the boys' lamps, which begrimed the busts of Horace and Virgil in the schoolroom. The number of school hours varied, but, with the authority of Ausonius, was usually six. Galen tells a tale of a grammarian Diodorus, who was subject to epileptic fits, unless he took nourishment during this time, and, on his advice, took, at the

third or fourth hour, bread soaked in wine, which restored him. But, in Greek-Latin schools, the pupils at midday went home for their early meal, changed and came back for the afternoon. The usual entering age, according to Paul of Aegina, whose rules more or less define the practice in the early centuries and in the West, was six or seven; geometry, grammar and gymnastics begun at twelve; the years from fourteen to twenty given to higher mathematics and philosophy and the severer exercises. The teacher's worst task was to keep discipline among the excitable and fidgety boys, whose moral education he had to supervise like a father. St. Augustine repents, in his Confessions, his schoolboy sins: his fear of making a mistake was greater than his endeavour to rid himself of envy of those of superior social standing. He was always deceiving his pedagogues, teachers and parents, loved playing with nuts, balls and birds, seeing pantomimes and acting them.

Many schoolboy scrawls have been found on the walls in Pompeii. We also have a schoolboy's Will of Sir Jack Porker (Marcus Grannius Corocotta), a great favourite with the 'curly-haired legions'; the victim before immolation at the cook's knife-blade leaves his father Sir Boar-Larding (Verrinus Lardinus) thirty measures of acorns, his bristles to the shoemakers, his ears to the doves, his tongue to advocates and babblers, and so on: his tombstone is to be engraved in golden letters, 'Sir Jack Porker lived 999½ years; one half more would have made him a Millenarian'. As now, so then; school-wit is the same, the same little wars between boy and master, the same boyish gibes. A Greek collection of anecdotes has preserved us the following schoolboy story. An elementary teacher tells one boy: 'Dionysius, attention! No fooling!' The boy replies he wasn't doing anything: the master rejoins, 'take it for next time'. Quintilian says one of the reasons of the preferability of school to home teaching is the formation of friendships and the incentive of equal rivalry. Others maintained that school-life corrupted morals, though boys of good family were accompanied there by their pedagogues: the reputation of the teachers was also often impugned. Discipline was enforced by the cane and the whip: only a minority (one of them Quintilian) took a humane view, condemning corporal punishment. The hardships of the teacher

were often aggravated by the pretensions of the parents, over whose unreasonableness and over-fondness of their boys Orbilius wrote a whole book of complaints. School-dust, at least, was a curse from which teachers in Rome were free, as they taught in spaces open or half-open, on flat roofs, or in the courtyard adjoining the street, separated from it by a curtain. The summer holidays lasted three to four months, for, in the summer, Martial says, boys, if healthy, could learn enough of themselves. There were, besides, many festival days. Private tutors, especially Greeks, complained, often not unjustifiably, of all kinds of maltreatment and humiliations, and that they scarcely earned enough to pay shoemaker or tailor: whilst Romans asserted that, in the houses of the rich, these foreigners were preferred to them, and intrigued and wormed themselves to the effective sovereignty of the home.

Grammatical instruction at Rome was poorly paid. Juvenal gave 500 sesterces (5 gold pieces) as the fee for a year of eight months' work: but even thus the earnings for thirty scholars was only 15,000 sesterces (£163 2s. 6d.), without deductions for rent, etc. Good teachers were, no doubt, better paid: some may have had more pupils, some less: Martial makes one petition the Emperor for the Privilege of Three Scholars, instead of Three Children. In Diocletian's tariff the monthly fees for reading and writing are fixed at fifty, for arithmetic or shorthand seventy-five, for Greek and Latin and Mathematics 200 denarii (then worth less than 4s.). The competition was great; at the close of the Republic, there were twenty schools at Rome. Many schools were held in partnership, and older teachers (e.g. the friend of St. Augustine, Verecundus at Milan) employed assistants. Schoolmasters, generally, as Ovid says, but for a few great exceptions, drew very small incomes. Marcus Verrius Flaccus and his whole school was taken in by Augustus into the Palatium, and he received 100,000 sesterces (or £1,087 3s. 0d.) for teaching his grandchildren. Remmius Palaemon derived an income of 400,000 from his school, and no less from his private property, built in the first instance on his profession, and increased by a tailor's business and agricultural profits. Thus he, with the help of an expert, made a neglected vineyard at Nomentum (which he bought for 600,000) realize in less than eight years 400,000 on the vintage, and sold the

estate in ten years at four times the price of purchase to Seneca, who was a zealous cultivator of the vine and often mentions this estate. Epaphroditus of Chaeronea, a teacher in Rome from Nero's reign to Nerva's (he died at the age of seventy-five) owned two houses at Rome and a library of 30,000 volumes of great value and rarity. Grammarians received no other official posts, save as librarians in Rome and Alexandria, the higher places in the Correspondence Department only very exceptionally.

Professors of oratory were, to some extent, in similar difficulties. They, too, had to endure the whims of parents and the indiscipline of pupils, who often preferred dice or tops to the dying speech of Cato, and rubbed their eyes with oil, so as to malingering. Quintilian finds pleasure in recollecting that teachers arranged the class according to the work done; the value set on being top boy proves they were all still boys. Some few may have been older, e.g. Gellius, who attended as a young man. Martial calls Quintilian, as professor of oratory, 'the noblest guide of irresolute youth'. The rhetor Verginius Flavus was banished at the time of the Conspiracy of Piso for his influence over his *iuvenes*. Juvenal mentions that Rufus the rhetorician and others had been beaten by their own pupils. St. Augustine found the Carthaginian boys so wild that he abandoned his school of oratory there and settled at Rome, where discipline was less lax. And, at Rome, he fared so ill that he applied for a post at Milan. Libanius generally received nothing, as his pupils were too poor, or gambled or debauched away the moneys given by their fathers to pay the fees. But rhetoricians received more than grammarians (Juvenal mentions 2,000 sesterces, £21 15s., as the fee): their position was more assured and in greater esteem; the course was higher, taken by adults, and of practical necessity, as choice and flowing speech was the first requisite of culture, and indispensable for many situations and all the higher offices. Professorships of Greek and Latin oratory were then, in Rome and elsewhere, the only municipally paid posts: at Rome the salary was 100,000 (as much as a procurator of the third rank received, and four times as much as a military tribune). The first holder of the State Chair, founded by Vespasian, was the Spaniard Quintilian; he gained great wealth, and, as tutor to the princes, consular *insignia*.

R.L.M.

M

Nero's avowed passion for oratory enabled many teachers of oratory to rise from the lowliest beginnings to senatorial rank and the highest honours. In the first century even, and yet more in the second, some might become imperial secretaries, and thereupon hold the higher offices. One anecdote makes an astrologer soothsay of a boy he would become a rhetor, a praefect and a provincial governor. Hence, this profession would be embraced by knights: Blandus, under Augustus, is the first instance, freedmen having, up to that time, been the only givers of an instruction deemed dishonourable in an acquisition held in highest repute. Rhetors would often be knighted by the Emperors: thus, Dionysius of Miletus was knighted by Hadrian, made procurator in several provinces, and awarded the honour of the public meal at the Museum in Alexandria. Philostratus also mentions a sophist, Heliodorus, who with his sons was given the *civitas* by the Emperor (? Severus). No such tales are told of grammarians. After the second century, not only Rome, but nearly all the other cities and towns appointed rhetors, and the number of students at Rome increased considerably; for, being armed with recommendations from the famous teachers of Rome, they could most easily gain official posts in Italy and the provinces. Pliny requests Tacitus to select from his many admirers young men suitable to teach rhetoric at Comum. Fronto applies to his son-in-law Aufidius Victorinus for a recommendation for Antonius Aquila the rhetor to a public professorship in Gaul, in the cities of which teachers of Greek rhetoric held public appointments at the time of Strabo. Lucian boasts of being one of those, who held a highly paid post.

The Courts of Justice afforded a more profitable theatre to the rhetorician than the lecture-room; not every capable teacher could be an advocate, but many, like Quintilian, combined both, or passed from the one to the other, selecting the profession of teaching as a more peaceful occupation for old age. The great qualification for advocates was then eloquence, the special object of the jurist's ambition, to which the study of the law was subservient. Most of the professional *advocati* were simply rhetoricians, and employed *pragmatici*, or legal advisers, on both sides. Of these *pragmatici* mention will be made.

Advocacy was the obvious road of success to plebeians with brains and ambitions : ' the *toga* was the means of advance ', and worn by advocates and clients : Quintilian is called by Martial the ornament of *togati*. In Italy and the provinces this was the profession of the talented and ambitious (e.g. Lucian and Apuleius) : in Petronius the freedman will make his son an advocate, if not an auctioneer. Advocacy and law were the most honourable civil callings, and the only ones accessible to the third estate and reputable to knights and senators ; the former was the only ladder to success for low-born talent and fortune ; by it Eprius Marcellus and Vibius Crispus attained the Consulate, the Friendship of the Emperor, and great power. The authors of this epoch, Seneca, Suetonius, and the elder Pliny, were knights and began at the bar : Pliny the Younger, who pleaded in his nineteenth year, and Fronto, as senators, still remained true to advocacy.

Famous advocates lived in great state ; their roomy and decorated *atria* daily crowded, their names in every one's mouth, courted by the rich and the mighty, sought for by strangers from districts whither their fame had penetrated. In their houses and the vestibules stood their statues (mostly erected by grateful clients), and even equestrian figures of them. Their steps and their portals were decked with laurels commemorative of forensic victory. A great crowd would follow the triumphant pleader home, whilst the acquitted parties shaved their heads, as a sign of a danger escaped, and repaired to a temple to thank the gods. And what if advocates gained neither rank nor office ? Their doors were besieged by parties, and guarded by janitors, and they gained wealth, in no dishonourable fashion. Besides these great advocates there were, of course, many small ones, too glad to deliver four speeches for a piece of gold, with a commission to the *pragmatici*, scarce able to pay their rents. Country clients generally paid in kind. The rows of jars of fruit in the storeroom of a great advocate would be the gift of some fat Umbrian defendant ; hams and casks of salted fish a recollection of a Marsian client ; in Martial a Picenian sends his advocate a little box of olives for the Saturnalia, a set of seven glasses in coarse Saguntine work, and a red striped napkin : Juvenal mentions as fee five bottles of country wine, and so on. On the other hand, Martial implores clients to spare his friend *Restitutus*

the advocate such gifts on his birthday ; for a boastful shopman by the Porticus Agrippae would send him purple cloaks ; a defendant in a suit for a drunken fight, dinner costumes ; the young woman, who has just divorced her husband, would herself bring genuine jewels, and the old connoisseur a fine piece of marble.

The profession was very overcrowded, and advocates had to resort to advertisement of all sorts. To attract attention through an air of prosperity they always walked about with big bundles of documents, richly dressed, with retinues of slaves and clients round their sedan-chair ; they hired valuable rings to put on during the interview, so as to extort higher terms. They would bid their clients retail the facts to their assistant, or meet them 'only on the day of hearing', thus to seem pressed with work, or to make a show of instant perspicuity'. For their speeches they would demand a very generous measure of water, wander far afield with much irrelevance, in an action for a lost hen mouth and intone and gesticulate about Marius and Sulla, the wars with Carthage and Mithridates, and their hoarseness would involve much alleviation. They did not stickle at hiring applause, and secured a fine escort home. Yet, even thus, fortune sometimes could not be bought : many had to suspend payment and betake themselves to Gaul or Africa. No few prostituted their eloquence to any and every cause ; many, piratically (in Quintilian's phrase) settled their fees in advance. Martial specifies 2,000 sesterces (£21 3s.) as such a fee, the client to pay half if he lost. Philostratus mentions that the famous sophist Polemo undertook an action in Sardes, on which the entire property of a rich Lydian depended, and exacted two talents (£472 2s.) as his fee. But the judges, too, occasionally sold their decision ; as actions might be prolonged even twenty years, and survive the original parties, besides consuming their property, Martial recommends payment as cheaper than litigation. Often, too, advocates 'prevaricated', i.e. were bribed by their opponents to present a bad case ;—though the penalty, if discovered, was disbarring. Hence advocates were abused as a 'venal race', and their wives said to derive from their husband's greed for pelf, a greed for food. A further cause of disesteem was their habit of abusing not only their opponents (often at their clients' request), but their opponent advocate as well. Lucian

stigmatizes advocacy as indissociable from deceit, lying, impudence, and pushfulness. The picture Ammianus Marcellinus draws of all who live by litigation is even more lurid. Pettifoggers and wranglers were so many that their enemies compared their oratory to the yelping of dogs. Their lively gestures were mocked at: a dumb jester of Tiberius boasts, in his inscription, of having been the first imitator of the advocates.

(iii) *Jurisconsulti*

The *jurisconsulti* ranked as high as the advocates; Quintilian mentions, as a favourite school-essay, 'which of the two, a lawyer or a soldier, is of higher standing?' But law, whilst offering knights and senators a road to the highest positions, offered lesser folks something inferior to advocacy. Quintilian says jurisprudence was practised mainly by disappointed barristers; Libanius says only the slow-witted took to poring over the heavy parchments of juristic lore. But it was profitable enough to attract many of the third estate. One of Petronius' *bourgeois* gives his son a collection of red-backed books (*codices*), to 'learn a little law for home use', as 'it spelled money'. Juvenal says that in the lowest classes men were found capable of unravelling knotty points of law: in one of his satires, a father, goading his son on to work and earn, gives him a choice of advocacy, study of law and a centurionship.

Jurisconsulti also made money as teachers, as only few young men can have been introduced to the law by high professors of it, and been able to dispense with paid instructors. Very many took up this study; provincials, Greeks even, flocked to Rome for this purpose. Most of the great jurists were provincials. Gaius came from Little Asia, Papinian from Syria, Ulpian from Tyre; Cervidius Scaevola, Modestinus, Callistratus, Marcianus, Tryphoninus, were all from the Greek Orient; Salvius Julianus, and perhaps Tertullian, from Africa. Jurists of lower rank took fees for their courses; but Masurius Sabinus (under Tiberius), who began poor, and was knighted only at the age of fifty, would not accept fees, but let his pupils support him. Ulpian mentions payment as the usual thing: it was preliminary to the course, as it could not be legally enforced afterwards. In Rome jurists were exempt from becoming *tutores* and other burdens, but not in the provinces.

In the first half of the second century, if not earlier, *stationes* were scattered throughout Rome, at which jurists gave public instruction and advice in law. Gellius (it was when he had abandoned the school for the law, about 160) says that the favourite question at these stations was whether a quaestor could be summoned by a praetor. Pompeius Auctus, who, according to Martial, 'sat in front of the Temple of Mars Ultor'—i.e. had his 'station' there—was 'deeply versed in law and skilled in the use of the *toga*'—i.e. both a *pragmaticus* and an advocate—and remained up to ten o'clock. The right of giving *iuris responsa* was first limited by Augustus to imperial nominees, and their written and sealed opinions were binding in Court. Other jurists' opinions had a merely scientific and theoretic significance. But ordinary jurists even could hardly fail to have many clients, as soon as they attained some fame; these would arrive at cock-crow and, no doubt, pay for the opinion. Ammianus, who severely censured the jurists of his day, says they charged even for yawns; and made matricide venial if their client were rich enough. A jurist was essential to any litigation, and he, not the advocate, was the principal person: tombstones bear the legend, 'may pettifoggers and jurists avoid this monument', so much might they tamper with testamentary directions. Claudius liked giving *responsa*, and his reliance on advocates rather than jurisconsults proved his incompetence. In Seneca's pasquil the advocates bewailed his death as the termination of their saturnalia, and the *pragmatici* crept forth again, like resurrected corpses, thin and ghastly.

Sometimes jurisconsults (e.g. Paulus) acted as advocates, but only exceptionally, their usual function was to advise. Quintilian, anxious to degrade jurisprudence and uplift oratory, speaks of these *pragmatici* as mere onhangers of the advocates, the powder monkeys to the real combatants. Libanius says, that in the good old days, before lawyers were so unduly esteemed, they had to wait humbly on the advocate's command to recite the law. This occupation was only taken up by smaller jurists, at low fees, from country clients, often in kind; such as a sack of corn, millet or beans.

Jurists also earned by drafting notarial or other written documents, such as petitions, deeds, contracts and guarantees. They could be punished (in the provinces by the governors)

by exclusion from the Forum or inhibition of legal practice ; specifically they might not draft deeds or petitions or depositions ; or have their register in the public archives of original documents, or sign, witness or draft wills, a large part of their business. Nero confiscated the goods of those freedmen of his who did not testify their gratitude to the Emperor, and punished the lawyers who drew up the offending wills. Non-jurists even would draft wills, as it was a profitable business. A scribe at Venafrum boasts on his tombstone of having made out wills for fourteen years without a jurist's assistance, and a schoolmaster at Padua of proficiency in will-making. A *testamentarius* of Gades, Quintus Valerius Litera, seems to have derived his cognomen from his business.

Finally jurists often held the post of assessors to judicial officers, who, in Rome and her provinces, were, from Republican times downwards, bound to associate legal persons in making their decisions ; and these would often be the determining influence ; Seneca says that Praetors gave the sentences dictated by their clerks. This custom in the Empire, together with the bureaucracy, ever took more defined shape, and long before the third century, judicial magistrates (in Rome the *Praefectus Urbi, Praetorio, Vigilibus*, the Consuls and Praetors, in the provinces the governors) were legally bound to have one or more judicial assessors. Josephus says in his polemic against Apio, of the early second century, that the holders of highest posts showed their ignorance of law in this universal custom. The right of the assessors to some fee (acknowledged as early as Trajan) was expressly legalized in a rescript of Antoninus Pius. Up to the end of the second century, these fees were agreed upon between the provincial governors and their assessors : after the third were directly paid from the Treasury. In Rome there were agencies for placing young lawyers, after their apprenticeship, as magistrates' assessors. At the end of the second century, if not before, it was usual to appoint to judicial offices, only men with experience as assessors, and candidates learnt in the courts from the lowest upwards.

(iv) *Medicine*

Medicine was, up to the last, largely in the hands of freedmen and slaves ; Justinian authorized the maximum price (sixty gold-pieces) for slaves thus trained, eunuchs fetching

only fifty. Jurists constantly speak of the services due from physicians' trained freedmen ; thus, they had to visit their patrons' friends gratuitously. Patrons could also prevent their freedmen from setting up a competing practice, and, with this object, compel them to accompany them on their own visits.

Free-born physicians at Rome were mostly foreigners. If permanent residents, Julius Caesar enfranchised them, as also teachers : Augustus extended this by conferring civic immunity. Romans, according to Pliny, rarely learned this profession. Most of them were Greeks and Orientals, especially Egyptians, and men summoned to Rome to cure diseases endemic in their own country. The principal of these were eruptive (the Bible speaks of the 'boils and blains of Egypt') : Galen speaks of the commonness of elephantiasis. Under Tiberius there was a plague, imported from Asia, and Egyptian physicians were brought to Rome, to cure only this disease : they returned with great profits. Nero summoned an Egyptian physician to cure a friend of a herpetic eruption. A recollection of this condition of things is preserved in an Arabian legend of modern Alexandria, of a spring that cured leprosy, and the King of the Rumi, who searched for it. At Rome patients felt more confidence in foreign physicians, though, especially in the Early Empire, there were no few good Roman practitioners at Court. Scribonius Largus, Claudius' physician, accompanied, as he says, 'our God Caesar' to Britain. Vettius Valens, another of his doctors, was a knight, a dignity conferred on other Court physicians, e.g. the freedman Antonius Musa, who cured Augustus by cold-water treatment, after all other physicians had abandoned the case. Galen mentions several medical men who invented drugs ; some are Roman, such as Valerius Paulinus, Pompeius Sabinus, Flavius Clemens. Such names are common on oculists' stamps, and, in the Western provinces, most of the doctors were not Greeks.

Strabo is the first authority for the communal appointment of doctors for cities outside Rome ; such as Massilia, and other cities of Gaul. Antoninus Pius defined, for the Province of Asia, the number of communal physicians, who were to enjoy immunity, as ten for the large cities, seven for smaller ones, and five in the smallest. This immunity, extended by Vespasian and Hadrian to the provinces, allured many to

medicine. Probably, after the second century, most cities appointed communal doctors, and Galen mentions that, in many places, large, roomy, well-lighted halls (*larpeia*) were assigned to them, as offices. In the larger towns, doctors formed *collegia*, e.g. at Beneventum; these guilds would normally, as at Turin, have a common cult of Aesculapius and Hygieia; and, in Greek cities, they might often be priests of these deities. Inscriptions of two cohorts of police (*vigiles*) at Rome in 210 A.D. record that every cohort (of 1,000 men) had four physicians attached, ranking as the last subordinate officers. If the same proportion held good for the legion, the number must have been twenty-four, all called legionary doctors. All divisions, too, had their special medical officer. To the British fleet, there was a special oculist attached. One Marcus Ulpus Sporus was first physician to two corps of cavalry, and then official physician to the town of Ferentinum. Physicians, as the staff of legions, city and praetorian cohorts, had to be Roman citizens, and Caesar's grant of the franchise to all doctors may have been induced in part by considerations of hygienics. On Trajan's column two physicians appear armed like soldiers, busied in binding up wounds and extracting arrows.

The title of *archiater* (Head-physician) was borne by imperial physicians, the first to be so called being Claudius' physician Gaius Stertinius Xenophon, and Nero's Andromachus: the ordinance of Antoninus Pius may have conferred the title on city doctors in Greece and Little Asia: as also in Italy, where we find a knight of Beneventum, who was also the first official of the commune, and in Pisaurum a freedman, in Aeclanum a Greek, in Venusia a Jew. The origin and bestowal of this title is uncertain, as also when it first became, as it was in the fourth century, an official rank, with its proper emoluments and privileges: in Galen's day it was in some way a superior medical post. A decree of Valentinian I A.D. 368 to the City praefects directs the appointment of fourteen *archiatri* for the fourteen regions, besides the Athletic Society (*Porticus Xysti*) and the Vestal Virgins, to whom doctors had been assigned: they were to receive salaries, treat the poor, but might also take fees. Vacancies were to be filled by the remaining *archiatri* carefully selecting a candidate, and proposing him to the Emperor, 'worthy of their college, their *archiatria* and

the imperial judgment'. A decree of 370 A.D. makes such an election valid only with the assent of the seven seniors of the order: the new officer ranked last, and all were promoted one degree.

From medical writings the methods of practice are recorded with much more detail than the information extant for the other professions: the chief of these is the comprehensive work of (?) Claudius Galen, one of the most prolific writers of all times. Born at Pergamus about 128 or 129, he studied medicine at Smyrna, Corinth and Alexandria, from 156-7 and 161-2 was gladiatorial physician at Pergamus, then passed three years at Rome, from 162-6, when he returned to Little Asia. On the summons of both Emperors, he repaired to Aquileia in the winter of 168-9, refused Marcus Aurelius' offer to accompany him on his German campaign, was physician to Commodus as a boy at Rome, and died in 198 or 199. How extensive his practice was, may be estimated from the fact that in one summer (probably at Rome) he had four hundred serious cases. The number of his free patients, who were not confined to their beds, was about three to four thousand a year.

In antiquity there were no examinations and little responsibility: hence many unqualified practitioners thrust themselves into a lucrative profession, such as shoemakers, carpenters, dyers or smiths, just as unsuccessful doctors became corpse-bearers or professional gladiators: at any rate, Martial scoffs at such, who in their new occupation practised the old one still. Amongst these quacks, makers of salves and officinal wares rank high. Galen says that most so-called physicians of his day could hardly read, and warns his colleagues of the necessity of good grammar in addressing patients: such physicians also would know nothing whatsoever of rhetoric and philosophy. Thessalus, an apprentice of his father, a weaver, as a doctor under Nero gained great vogue, and said all his knowledge had been won in six months. His example inspired others. Physicians were accompanied by their pupils on sick visits. Martial says that, once when he was ill, Symmachus with one hundred students attended him, and their two hundred ice-cold hands gave him fever as well. Philostratus says that Philiscus was attended by Seleucus of Cyzicus and Stratocles of Sidon and over thirty pupils.

Perhaps, too, the large number of practitioners necessitated

many specialists (who abounded in Egypt) apart from assistants, who plucked healing roots, concocted drugs, bandaged, clystered, bled and cupped. No one, says Philostratus, can be a universal physician; there must be specialists for wounds, and fevers, and eyes, and consumption. Most numerous of these were the oculists: over one hundred seals are extant, and there was a branch of operators. Caligula's freedman Gaius Julius Callistus owned amongst his slaves more than one accomplished oculist. Galen boasts of having cured an eye-trouble by ordinary treatment, despite the existence of many 'so-called' oculists. Ear-doctors, dentists and others, too, are known of who treated fractures, fistulae, uvulae. Martial speaks of a number of Roman specialists in the year 95: thus Cascellius draws or stops teeth; Hyginus burns away over-long eyelashes; Fannius treats dripping uvulae innocuously; Eros erases slaves' brands; Hermes is the best doctor for fractures.

There were women's doctors, and female physicians; these were mostly midwives, though they also treated women's diseases. One Valeria Verecunda's tombstone preserves her title of 'first medical wetnurse of her *regio*'. According to Soranus, a good midwife went through a complete medical training. She had to be able to read, so as to learn the theory as well; must not be avaricious, that she might not sell means of abortion, nor superstitious, lest some dream or omen should make her careless. Galen observes that hysterical women called themselves thus from hearing the word on their female doctors' lips. Juvenal makes a fat Lydian woman treat sterile women with a savoury drug; and Galen mentions an Antiochian woman's plasters for the spleen, dropsy and gout.

Surgeons specialized more than any. According to Plutarch they worked with physicians without impinging on the other's territory. According to Galen, at Rome none but surgeons operated: a rule he himself there followed. He also says he was consulted in all interesting cases by the physicians of Rome and Ostia and Portus, so that he saw every extraordinary case of distortion of the shoulder. But surgery, too, was more minutely subdivided. Galen specifies the operations for fractures and stone, and the sewing together of the eyelids. Alcon the surgeon, put by Martial along with Symmachus and Dasius, the principal physicians of Rome,

'mercilessly cut incarcerated ruptures, skilfully treated the bones'. Implements for fistulae operations, and others have been found at Pompeii and elsewhere. Anaesthetics were administered in the form of mandragora juice or atropin (also used as a sleeping-draught). A tablespoonful ($2\frac{1}{2}$ per cubic inch) was a sufficient dose to produce sleep; the mere smell was enough with some men. For the purpose of couching cataract, the pupil was enlarged by *anagallis*.

No exact line could be drawn between theory and practice in medicine, but a distinction was recognized between empirical and advanced study, when professors were called medicinal 'sophists', 'sitting on high chairs and overwhelming their hearers with abstruse lore', but quite incompetent practically. People generally reckoned any one who dealt with curatives theoretically from a book a sophist.

Roman physicians, at the top of their profession, made large salaries. Wealthy men had their own family doctors. According to one tale of Galen, a rich man with an estate near Rome requested him to treat one of his stewards, who was going blind, as the family doctor, as an adherent of Erasistratus, would not consent to bleed. Family doctors received fixed salaries. Quintus Stertinius (the brother of Gaius Stertinius Xenophon), in reply to Claudius, proved his income from private practice as amounting to 600,000 (£6,525 10s.). In the Pandects a legacy is noticed for future annual payment to a doctor after his patient's death. Such fees were paid on the first of January. But special high fees were charged for individual cures. Manilius Cornutus, ex-praetor and legate of Aquitania, agreed to a fee of 200,000 for scab; the same sum was charged by Charmis of Massilia to a rich provincial for a second treatment. Galen received from Boethus, a consular, later on governor of Palestine, 400 gold pieces (£435) for curing his wife. His income was also increased (like other famous doctors') by consultations outside Rome, by letter; from Asia, Gaul, Spain and Thrace for eye-troubles: he answered pertinent questions, sent the drugs, and thus restored to health many whom he never saw. We still possess his advice to the epileptic son of one Caecilianus, framed on consultation with the family doctor, Dionysius. The salaries of Court physicians have been mentioned. Crinas of Massilia left 10,000,000 (£108,750), after spending an

equivalent amount on the walls of his native city and similar projects. Claudius condemned Alcon the surgeon to a fine of 10,000,000, which he earned back in exile in Gaul, and during the first few years of his return to Rome. Possibly, however, modern fees are higher. In 1787 even Hunter took two guineas for a consultation and four for a visit; in Berlin about 1800 Heim made 12,000 thalers a year; the incomes of Brodie and Wright in 1851 were about £10,000, and Billroth's at Vienna, in his first year, 12,000, or 15,000 gulden. In little places in antiquity practice was proportionately remunerative, as the inscription of the freedman Publius Decimius Eros Merula at Assisi, 'clinical doctor and operator of the eye', shows. He paid 4,000 for his manumission, for his appointment as *sevir* to the city exchequer 2,000; 30,000 on statues in the Temple of Hercules, to the paving of the streets 37,000, and owned 520,000 on the day before his death. One Heraclitus of Rhodiapolis in Lycia gave his services free there; his fortune had been built up by practice in Alexandria, Rhodes and Athens; he erected a temple to Aesculapius and Hygieia in his native city, gave the statues and spent 60,000 on the Feast of Aesculapius in doles and bouts. Pliny says competition, and not delicacy, reduced medical fees, which they demanded and got at the bedside, and calls it 'taking rapacious advantage of the imminence of death'. Ulpian says: if an oculist by using harmful remedies nearly blinds his patient, and induces him to sell him his property under the proper value, the provincial governor is to decree restitution for this *incivile factum*. A decree of 370 A.D. recommends the communal *archiatri* 'rather honourably to relieve the poor, than slavishly serve the rich. We allow them to accept what the restored offer them, but not what the sick promise in desperation'. The author of a pharmacopoeia compiled in the first half of the fourth century from Pliny's *Natural History* had fared ill on his travels at the hands of his various doctors. Their greed made them undertake what they could not effect, and sell the cheapest stuffs at famine prices, prolong illnesses, curable in short time, to secure large fees. It was to arm himself against their like, that he put together many of the most usual medicaments.

Galen gives very definite counsel as to medical relations with the patient. His visits should be long or short, as his patient wished, whom he must not irk. Some doctors clumsily

awake and irritate a patient by long speeches or noisy tread ; such things must be avoided. He must show tact, not blurt out the truth, like Callianax the Herophilean,¹ who answered a patient's complaint at his imminent death ' Patroclus also died '. Some made themselves odious for rudeness, some contemptible for servility. The doctor must avoid both extremes, be affable, sensible and dignified. A suitable theme for conversation is Hippocrates' maxim, that the cure depends on three factors, the sick man, his sickness and the physician. If the patient aided the doctor, both would overcome the sickness. Some patients must be enlivened with anecdotes. The doctor must deport himself properly, not be pompous, affected, or cringing. The golden mean must be followed, but the patient should be humoured, if he has dislikes in dress or style of hair : thus short hair was worn at the Court of Antoninus and long at that of Lucius Verus. Doctors should not reek of garlic or onions. One fellow-countryman of Galen smelt of wine, when visiting a rich man who had fever. His patient bade him stand further away, as the smell was overpowering. Quintus brusquely replied that he had to stand the far worse smells of the sick-room. Many doctors acceded to their patient's every wish, giving them cold water, snow-cooled wine, baths, whenever requested. True, they thus found a ready key to many doors. They grew rich, had much power, and often had pages given them as pupils. The rich were the most rebellious patients ; best avoided altogether, says Galen ; but doctors had, willy-nilly, to put up with their whims. Whilst disapproving of mere submissiveness, in special circumstances, the physician might, against his better knowledge, indulge the patient in some comparatively harmless trifle ; doctors, if loathed, are not obeyed.

The patient is docile, said Hippocrates, if he regard his doctor as a miracle or demi-god. At Pergamus, patients consigned to Aesculapius' Temple would undergo the severest orders, abstain from all drink for a fortnight, and do what no mere doctor could have induced. And his best spell was correct diagnosis and true prediction. Galen used to tell the nature of the disease, wherever possible, without questioning the patient. Often, had he, like Erasistratus, felt by the quickening of the pulse that love was at the bottom of the

¹ Follower of Herophilus of Chalcedon.

trouble, if the beloved came into the room, and the same magic helped Galen to discover the bad conscience of a rich patient, who, contrary to orders, had taken certain remedies, and in pills, so as not to discolour the tongue, but stoutly denied the charge. These tales gratify Galen exceedingly, and he claims that, 'thank God he had never once made a false diagnosis or prediction'. He discusses Hippocrates' saying that the physician should help, or not retard the patient, and says he, at least, never took the latter course. But whilst he laid much weight on his diagnosis, others thought they were no doctors, did they not, immediately after entering the sick-room, gird themselves, lay a plaster on, or make a fomentation, or a clyster, or bleed. Such should bethink themselves of the maxim of Hippocrates, not to bare their elbows; even advocates, and doctors all the more, should avoid appearing like prize-fighters.

Medical quackery occurred in all shapes, from the thoughtful frown in trivial cases, to the theatrical operation before a multitude. Celsus says only playactors should prank themselves out. Galen observes that theriac was often of great service, but people who recommended it for weak sight and poor hearing were mere hawkers. A certain amount of publicity was usual in antiquity. Doctors gave advice, sold and dealt out remedies, performed operations, in booths and shops opening on to the street, and treated cases as they came in, put-out shoulders, swelling, headaches and what not. The most incompetent were zealous to deck their offices with ivory boxes, silver cupping-glasses, and knives with golden handles. Epictetus says matters went so far, that the doctors asked their patients to step in.

Probably, too, physicians often gave public lectures, as Galen at Rome in the Temple of Peace; disputations might take place there. Shortly after his first arrival at Rome, Galen quarrelled with several elder doctors of the school of Erasistratus on a case when bleeding seemed to him essential; on the next day, his fellow-countryman and pupil Teuthras read Erasistratus' books out before 'all the philosophers', and proved that his treatment often caused death unnecessarily, and challenged the old school to a public disputation. Their sense of dignity, however, would not let them argue with a younger man. But, as Galen used to give daily lectures on

questions put to him by his auditors, he had to debate Erasistratus' contention. He dictated this discourse, at Teuthras' wish, to a slave: it was published without his knowledge, and converted the Erasistrateans to his views. Galen also tells us of how a theoretician or sophist, after maintaining an impossible position in a lecture, and being publicly applauded, slunk off, to avoid Galen's refutation. Next day Galen handed it in, and it was unanswerable. Even charlatans took to public dissertations on the organs and functions of the body, and their pretended knowledge won them patients.

No epoch lacked its distinguished doctors, and of them many, especially the Greeks, were authors. One Hermogenes of Smyrna in seventy-seven years wrote seventy-seven books (seventy-two on medicine). A Court-physician, Tiberius Claudius Menecrates, wrote 156 books in support of a new logic of medicine. Heraclitus of Rhodiapolis in Lycia, celebrated in his inscription as the first of physicians of all times, wrote medical and philosophical books in prose and verse, and bore the name of the Homer of medicine; he left his works to his native city, to Alexandria, Athens and Rhodes: in Rhodiapolis, besides other honours, he was awarded a statue *τῷ τῆς παιδείας ἀνδριάντι*.

Up to the twelfth century, north of the Alps, and, in ancient days, south of them, the pharmacopoeia had an altogether different meaning, as apothecaries, who regularly prepared drugs, scarcely existed. In Germany, they were hardly found in little towns before the end of the eighteenth century: thus Hufeland in Weimar (1783), 'as then usual', himself made and dispensed his pills and powders. In antiquity dealers in salves, drugs and groceries also sold medicines: the *aromatarii* were a guild at Rome; there were, besides, travelling hucksters and swindlers. From such shops, Pliny the Elder complains, doctors often bought the remedies, instead of exercising their proper profession of making them. The ingredients they scarcely knew, and, should they desire to make up written prescriptions, would be cheated by the salesmen. Many doctors bought plasters and drugs ready-made. Galen also groans at the frauds of those 'cursed dealers', and says they, too, were innocent victims of the collectors of herbs, who brought saps and flowers and fruits and sprouts into the towns. But the ingenious make-ups of these men

would deceive the greatest experts. Galen, in his younger days, had been a pupil under a man who forged balsam, Lemnian earth, white flowers of zinc and other rare drugs to perfection, and earned thereby largely; Galen, however, would not have his methods known, and fall into the hands of the unconscientious; he rather hoped to incite the young, by his writings, to investigate and discover the working of the healing plants for themselves. Any one who would have the command of all medicaments, must understand what are the useful parts of plants, animals, metals and minerals, and be able to distinguish genuine examples and forgeries.

But these important articles were seldom genuine, if merely imported: for security's sake, they should be specially got from the proper regions through reliable friends, and, if possible, a lifelong supply. Galen made several journeys for this purpose, and annually received regular despatches of such stuffs from many provinces, partly through friends, partly through the provincial governors, from Syria, Palestine, Egypt, Cappadocia, Pontus, Macedonia, Gaul, Spain and Mauretania. He once went to Lemnos to get Lemnian earth, and to Cyprus for her metals. In Cyprus his friendship with the imperial procurator of the mines at Soli enabled him to secure copper vitriol, copper vitriol water, cadmia, vitriolic ore, and white flowers of zinc, in quantities sufficient, not only for lifelong practice, but for distribution. Litharge he discovered between Cyzicus and Pergamus. He could not discover the river Gagates in Lycia (whence came the jet), though he coasted all along Lycia. From the Dead Sea he fetched asphalt and certain porous black inflammable stones: he went to Palestine, mainly, to get balsam, which grew in an imperial demesne at Engaddi in Judaea, and was only sold by the fisc. On his return, he had the luck of meeting a train of camels, bearing Indian aloe and lycium to Phoenicia, and of obtaining the latter pure, the impure material being unknown there. Many drugs had to be preserved in oils. But dealers sold not the old oil required, but swine-fat mixed with common oil, a very plausible composition; and the commercial pure oil was usually not old and had not the requisite qualities. Galen got oil from his father, who had kept it stored, and was ever renewing his supplies, which were thus perpetual, even should he live to be a centenarian.

R.L.M.

N

Physicians, in so far as climate permitted, cultivated the medicinal plants (as also in the sixteenth century Germany). Pliny complains of the experts of his day, who withheld their knowledge, contrasting it with the unstinted spirit of old, that searched every cranny and every peak, marked the nature of every root, and utilized what even the kine would not browse on. In some Greek works the pictures would be inaccurate, or descriptions only, or mere names be given: Pliny, however, had seen, with his own eyes, nearly all the medicinal plants in Antonius Castor's botanical garden (perhaps a freedman of a daughter of Marcus Antonius), the great botanist of his day, a writer on plants and cultivator. He had reached the age of a hundred without a single illness, and showed no signs of senility.

At Rome the imperial house had ample private stores of the curatives from all countries of the best quality. Sicily every summer sent her supplies, as did Africa and Crete (where the Emperors subsidized the collectors, 'who sent their medicinal stuffs carefully packed and labelled'): wicker baskets were there filled with herbs, partly for the imperial apothecaries, partly for sale in Rome. Galen mentions imperial slaves who caught adders, whence drugs were made. All the resources of this store were at Galen's service, as Court-physician. He could select the old Falernian of the proper year, from the long row of clay bottles, each duly labelled, or similarly the honey from Hymettus. The wooden cases of cinnamon dated back to Trajan, Hadrian and Antoninus Pius, and among them was a box four and a half yards long, containing a whole cinnamon-tree. Other stuffs must have been there in similar quantity (such as the balsam of Engaddi): Pausanias incidentally mentions that the valuable oil of Thitorea, used for salves, was sent to the Emperors.

Besides being able to get drugs, physicians had to know how to prepare them, and a good collection of recipes was an indispensable qualification, often the only one. Scribonius Largus, the Court-physician under Claudius, compiled such a book at the instance of his patron Gaius Julius Callistus the freedman, who gave it into the 'divine hands' of his master. The author imagined the gift of healing to be knowledge of the means of healing. Even if Asclepiades—as falsely reported—had cured illnesses without the use of drugs; a doctor who

did not possess two or three essential medicines for every evil stood in a very bad way. For medicaments defined medicine, and to excel in this knowledge, no effort should be shirked, and persons consulted, who, unconnected with the scientific study, often succeeded, where doctors failed. Thus Scribonius got one very successful cure of colic from an old hag in Africa, and a remedy for snake-bites from a stuff Sicilian huntsmen carried in their belts. His teacher Apuleius Celsus made up a remedy against hydrophobia, and sent it every year to his native place Centuripae in Sicily, where there were many mad dogs; but it only alleviated. But Scribonius was apprised that in Crete an old man from some barbarian land had been shipwrecked, and received a fee for a thoroughly effective remedy: he learned from Zopyrus, a physician from Gordium (who came to Rome on an embassy and stayed with him), that it consisted in a piece of hyaena-skin wrapped up: he instantly got it; but, he remarks, had fortunately not had occasion to use it. Ambrosius of Puteoli mentions as a remedy against stone a stuff that must be pounded with a pestle that had no iron in it—a superstitious cure he does not vouch for. Most of his remedies—one of them a toothpowder used by Messalina—he approves through personal use, and very few only on the oath of his friends.

A great part of Galen's writings, too, deal with the preparation of drugs. He wanted to enable the practitioner to substitute, if necessary, for the requisite drug, as many were helpless without their stores. Many medicaments were very much compounded, e.g. theriac (which was used until the nineteenth century) was made of sixty-one constituents, dried adders being one of them. The number of supposed medicinal stuffs was incalculable; some were loathly, such as bugs and centipedes. Galen is amazed at the recommendation by Xenocrates of Aphrodisias (circa 60 A.D.) of human brains and flesh and liver and blood as cures, considering the formal prohibition of cannibalism. The same authority prescribed certain secretions from the human body, and from hippopotami and elephants. Roman doctors, like Serenus Sammonicus—and Germans in the seventeenth century—prescribe excrements. Galen loathes such means, but says they may work well, e.g. for dangerous swellings of the throat the excrement of a boy externally applied, provided the patient was not informed

of what was being done. And further such remedies should be reserved for sextons, mowers, and people of no standing, who were no better than donkeys and might be similarly treated.

Medical books also touched on poisons and magic drinks, love-philtres, dream-inducers or means of tying up an adversary's tongue in Court. These Galen disregards, as also deathly drugs, in which experiment is crime. One man had two doctors who offered honey for sale, tasted it, and fled—to die. Some drugs also emptied the body of blood and thus induced death. According to a story Galen tells, in his youth, a man from Bithynian Thrace (near Byzantium) accidentally discovered a herb, which had this effect. He was arrested, and, on his trial, stated he had first experimented on a pig's liver, and then successfully applied it to the next man he met and on many others, and so killed them all. On the rack, he said he had not disclosed it to any one: but it was growing everywhere, and he was led blindfold to execution, for fear he might point it out on the way.

Poisons and antidotes were largely used and a large part of medical experiment. Nero's physician Andromachus, the inventor of theriac, in a long poem exalts it as a panacea against all poisons and for the most various diseases. Hence many took it every day as a preservative, for example Marcus Aurelius, but especially all well-hated men. Scribonius catalogues the effects of most of the well-known poisons, such as hemlock, opium, henbane, gypsum, litharge, whitelead, and their antidotes, one of which was a panacea invented for Augustus by Marcianus.

Many abused their science and dealt in cosmetics: such was the Court-physician, Crito, who wrote four books on the subject: Galen only retails the prescriptions for the retention of beauty. It were unworthy of him to detail depilatories, fragrances for clothes or rooms.

As the opinion obtained that the dearest stuffs were the most efficacious, and the rich, therefore, would have nothing cheap, his apothecary's business was extremely profitable to the practitioner. One rich man, whose slave Galen had cured of a dangerous tumour, asked for the recipe, saw that its ingredients were cheap, and demanded something not fit for beggars. Galen taught him a more expensive one, and he then experimented on free men and slaves, and acknow-

ledged his indebtedness to Galen for his great successes. Of the two kinds of storax Galen recommended the commoner and cheaper as a rule, and the rarer for emperors and the plutocrats of medicine. Laxatives were made needlessly costly and expensive.

The processes of popular drugs were kept secret. Claudianus, a friend of Galen, found in an inheritance, a parchment book containing a remedy for premature baldness, which, he knew, had been highly successful : but it was expressed in symbolic language, which Galen could scarcely puzzle through. Scribonius Largus gives a 'wonderful remedy for pains in the breast'; it was long known but popularized by Paccius Antiochus (a physician whom Galen often mentions) : it was very efficacious and a good investment for a doctor. He prepared it with locked doors, and mystified his assistants by telling them to pound many unnecessary powders. After his death, the recipe was given, at his wish, to Tiberius, who deposited it in the public libraries, just as, later on, Hadrian and Antoninus Pius ordered the like publication of the works of Marcellus of Side.

Drugs used to be labelled with their names, their inventors, and their objects, or even the name of a patient for whom it was intended, or on whom it had worked well. Galen gives some instances. 'A drug of Berytus, used by Strato of Berytus for watery eyes, Instantaneous'; or 'Eye-salve tried by Florus on Antonia, mother¹ of Drusus, after the other doctors had nearly blinded her'. 'For scab. Pamphilus found it very profitable at Rome, when scab on the chin was raging.' 'Ointment for gout, made for Patroclus, imperial freedman,—safe cure.' 'Ointment, by Pompeius Sabinus (called the 'expensive' ointment) for Aburnius Valens (perhaps the famous jurist) for diseases of the hip, gout, trembling and nerves.' Or euphonious names would be given, such as 'ambrosia', 'nectarium', 'anicetum' (*ἀνίκητρον*), Phosphoros, Isis, Galene (the name given by both Andromachi to their theriac), 'parrot', 'phoenix', 'swan' (from its colour). The labels were written on the packets or the skin drawn over them; Galen mentions that adders' poison if kept in a tin box ferments and bursts; or on a string attached. Only *collyria* or eye-salves were stamped, and sent out dry, in

¹ The text of Galen must be wrong: Antonia was the wife, not the mother, of Drusus.

square sticks. About one hundred and fifty stone seals of oculists have been preserved, in England, France, Germany, Austria and the Netherlands, in Italy only three, 'containing the names of the physician, the object, the drugs, the ingredients, and mode of dissolving (in eggs, water or wine)'.

This profession, unreservedly open, exposed to such temptation, must have included bad characters. Martial makes a physician steal the medicine-spoon. Poisoning and adultery were ascribed to doctors, or a 'feverless' murder of the husband. Greed, extortion, the spirit of rivalry between the many schools, mutual animosity leading to abuse at disputations and at the bedside, or to fights, were frequent accusations: they were said to be too cocksure, even as against an Apollo or Aesculapius, and envious to the point of slander, persecution or murder, especially as envy was fostered in Rome by the hugeness of the profits. His colleagues' hatred drove Galen from Rome; it grew in proportion with his patients' admiration of him: Lucius Martius, a fine character, whom Galen cured of melancholy, says his voice sounded like the priestess's from the golden tripod. The worst and most general vices of the profession were quackery, ignorance, and practical contempt of theoretical training.

The chief schools were the Dogmatics, the Empiricists, Methodics, Pneumaticists and Eclectics: besides them there were many others, named after their founders, such as the Erasistrateans. Tiberius Claudius Menecrates, the Court-physician, wrote an 'illuminative work on logic in 156 books, for which many great cities passed decrees of honour on him' and his Roman adherents put a monument up. Or these schools might name themselves after their method of cure, e.g. *οἰνοδόται* (wine-givers), or water-physicians: hydrotherapia became the fashion in Rome under Augustus through Antonius Musa, and under Nero through Charmis of Massilia. Charmis used to prescribe cold bathing even in the winter, and dip his patients in large baths: aged consulars were treated by him, who, as Seneca says, 'made an affectation of their torpidity'. Feuds were severe and vituperative; Galen inveighs against the 'simpleton' Thessalos and 'the asses from his herd', against 'the wooden-headed methodists'. No science, says Pliny, is more variable; Vettius Valens, the Court-physician, founded his new school, to be succeeded by Thessalos

with his absolute innovations, and mad polemics against all former doctors : on his tombstone he calls himself ' tyrant of medicine '. He was the head of his profession ; no charioteer or pantomime had a larger retinue ; yet Crinas of Massilia dethroned him, throwing on medicine a specious semblance of truer care and honesty, by associating it with astrology, and settling meal-times by the planets. And he too gave way to Charmis, so that three incompatible theories of medicine in succession ruled Rome. ' Beyond all doubt ', Pliny continues, ' their craze for novelty was simply ambition ; the patients were their pawns ; the sickbed the scene of their independent quarrellings : the tombstone, which says death was due to the too many doctors, tells the truth. Daily a new-fangled science ; daily are we blown about at the wayward mercy of the talents of Greece. Any voluble person has powers of life and death over us, just as though thousands of peoples did not live on without doctoring, as Rome did for six hundred years ; though she was no inapt pupil in the sciences and hungered after medicine until experience sickened her of it '.

Asclepiades of Bithynia, a talented man, in the latter days of the Republic, took up the teaching of rhetoric, and, finding it unprofitable, all at once turned to medicine. He inculcated a new diet, mainly based on expediency, but very adaptable to the patient's mood, and what with the grossest quackery—he revived the dead—brought it about that nearly all obeyed, as Pliny says, his laws, to fill his coffers, as though he were descended from on high. His fame even reached King Mithridates, who summoned him to his Court. Asclepiades declined, but sent a copy of one of his works on medicine. He won his bet with Fate ; that, were he ever ill, he would no longer deem himself a physician, and died, at a ripe old age, of a fall from a ladder. Magic was a great part of his success. He asserted he knew of herbs that could dry up rivers and lakes, open locked doors, put armies to flight and provide a purse of Fortunatus.

Magic and medicine had much in common, and was employed by doctors in good faith. The prodigious superstition which antiquity welded into medicine infected most of the practitioners. The most universal belief amongst all (not only amongst physicians) was in an antipathy and sympathy throughout all Nature ' in the friendships and hostilities

of things dumb and unconscious'. According to Pliny, medicine was the science of these antinomies. Thus Nature had created remedies easy of discovery and abundant; but expensive rarities and their mixtures had been begotten by human fraud and greed. Dioscorides too recommends sympathetic remedies: his pharmacopoeia obtained for sixteen hundred years as the oracle of medicine, as to this day in Turkey. He also tells of how men, when digging up hellebore, for use in such diseases as epilepsy and madness, ought to stand up and pray to Apollo and Aesculapius, and take heed not to be overlooked by a passing eagle, for this spelt the digger's death. Jasper in any form was serviceable as an amulet, and, tied round a woman's loins, quickened birth. But eagle-stone retarded birth and should be given to women, who desired this, to be tied round the left arm; if taken thence, and bound on to the thigh, birth would be painless. Galen says that jasper was a cure for abdominal pains. A prescription of Nechepsos, King of Egypt, made some engrave on it, a snake with a wreath of stars. But Galen's experience was that the charm worked well, unengraved; he had a necklace so made that the stones touched the pylorus, and this proved successful. He had been an unbeliever in spells, but had been converted, whereas the Pythagorean mystical numbers, as applied to the theory of critical days, seemed to him nonsense. For what should the seven Pleiades, or the seven Mouths of the Nile, have to do with the fact that, on the seventh day, inflammation of the lungs or the chest entered on the critical stage? It happened just as often on the other days. Ulpian says that enchanters, or exorcizers, must not be deemed physicians, though many proclaim the good effects. Exorcizing of demons was an ancient practice in Egypt, and practised by the Jews as well. Sceptics of magic would not easily doubt the astrology which, especially in Egypt, was the foundation of therapeutics, and esteemed indispensable by many doctors, or non-doctors. One physician, Decius Servilius Apollonius, who, according to his tombstone, died at the age of ninety-three, had prophesied this astrologically. Galen too believed the phases of the moon exercised much influence on the things of earth and approved the discovery of the Egyptian astrologers, that the positions of the moon in regard to the good and evil planets determined the condition

of patients. For example, if, at birth, the good stars were in the Ram, and the evil in the Bull, diseases are at their worst, if the moon be in the Bull, in the Lion, in Scorpion or Aquarius; whereas, no danger need be apprehended if the moon is crossing the Ram, the Crab, Libra or Capricorn. Any one who neither observed these phenomena, nor believed others' observations, was one of those blatant sophists, who ask for reasons of the obvious, and do not strive to proceed from proven facts on to unknown ground.

(v) *Astrology*

Astrology was a profession, illegal, often prohibited under severe penalties, but for the most part tolerated, in as far as the Emperor's person or matters of State were not touched. Amongst the teachers subsidized by Alexander Severus, by the grant of lecture-rooms and the appointment of sons of poor free families as scholars, *haruspices* and astrologers were included, besides rhetors, grammarians, doctors, mechanics and architects. Caecilius Argicius Arborius, the grandfather of Ausonius, clandestinely practised his art of astrology: he sealed up the tablets of his grandson's horoscope, but his daughter broke them open. St. Augustine in his youth lent much confidence to soothsayings, but was convinced of their falsity by an older friend, who had chosen star-gazing as his profession, thoroughly mastered it, and then turned to medicine on conviction of its untruth. But Firmicus Maternus (an author of about 350 A.D.), in disgust at the 'currish' quarrelsomeness of advocacy, and its risks, took to research in things divine and heavenly, i.e. astrology, so as to purge his soul from the contaminations of evil society. He, apparently, did not adopt astrology as a lucrative profession, but mentions astrologers in his book as the professional men. The professional tax raised from the astrologers of Alexandria was called the 'Fools' Tax,' because it was the clients who really paid it. Astrology does not seem to have declined in repute during the Empire. Astrologers, mainly Greeks, Orientals and Egyptians, at the palaces of the Emperors or the grandees, were constantly to be seen, intimate confidants, and advisers or inciters in enterprises of peril; hence often involved in cases of high treason.

Pammenes (circa 40 A.D.) was an astrologer of fame, whose

art created him many friendships : in the latter years of Nero he was relegated to an island, and there received messages and questions, and a yearly grant from the Consular Publius Anteius. Another relegate to the same island got hold of Pammenes' secret documents and in 66 denounced Publius Anteius and Ostorius Scapula for their correspondence with him : both anticipated condemnation by suicide. Astrology was the aristocratic form of prophesying, like psychical research nowadays, in comparison with fortune-telling from cards. Artemidorus, the dream-interpreter, despised sooth-saying from the countenance, the form or the hand, dice, dishes, sieves, cheese and fire, and even ghosts, as vulgar, and would only acknowledge dreams, entrails, the flight of birds and the constellations as authorized modes ; he also doubted horoscopes. But horoscopes were the favourite species of prophecy in all ranks of society, high and low : besides the ' holy ' pretentious prophets, in Rome there were many starbook makers, especially in the Circus, who made out horoscopes at a vulgar price. They would also forecast the weather, as certain changes in the wind occurred on certain days, a fact Columella disproves in a pamphlet. They would tell the farmer how his crops would turn out, or a merchant what chance his business stood, or the heir-in-waiting when a rich testator would die. The last would be the most frequent inquiry, and the answers suited the askers' books : Galen says the rich only troubled about astrology as a forecast of legacies. Engaged couples inquired of astrologers what would be a lucky day for a wedding, builders for the laying of the foundation-stone, and travellers when they should start ; the fee for such a consultation on one occasion was a hundred denarii (£4 7s.). To remove every possible doubt, astrologers would demonstrate their absolute knowledge of their clients' past. Trimalchio says his astrologer had recalled things he had himself forgotten, and told him ' your friendships will not prosper. No one will be grateful. Your wealth is great. You are taking an adder to your bosom ' ; but, adds Trimalchio, ' I have still more than thirty years to live, and a fortune waiting '.

Firmicus Maternus in his work on astrology (written at the instance of Mavortius Lollianus the proconsul and dedicated to him 354 A.D.) is at pains to present his science as innocent, elevating and enlightening, and one that none but those pure and holy as

priests should pursue. His admonitions to budding astrologers illustrate their faults and dangers. The initiate into the Holy teaching, he says at the end of the second book, must be like unto the image of God, and ever wear the crown of truth. He must be affable, and approached without dread ; modest, sober, frugal, content with little, that mere self love may not dishonour divine art. He, the priest of the Sun and the Moon and the other gods, who guide the plot of earth, must aim at behaving worthily of his model. His answers should be publicly made ; the questioner should be warned to ask nothing unseemly. Questions as to the condition of the State and the life of the Emperor he must pass by : both are criminal ; the latter impossible, for the Emperor's fate depends not on the zodiac : the lord of the world, his doom is supremely guided ; he is one of the gods set by the One God to perfect and maintain all things. So the *haruspices* confessed that no godhead they could invoke could explain the superior godhead of the Emperor. The master of all ranks and conditions is himself a god in power and station. Should any thus inquire, he should not be objurgated, but gently reproved and corrected. But he need not inform against an impious inquirer ; otherwise he might be implicated in the guilt of treason, and of bloodshed the priest must be pure. He should have a wife, a house, many and true friends, not be a hermit, yet abstain from all dissension and wrongful acts, and be careless of gain, a stranger to savage passion, have no joy in others' enmities, moderate in all things. He should flee from sedition and seek friendship, and always be blameless ; not perjure himself, or practise usury, or make others' loss his gain. He must not accept or promise on oath, not seem to beseech the gods for paltry things. To those astray, and his friends, he must point the right way, and save them from evil. Never should he partake of offerings at night, speak to any one secretly, but in full daylight exercise his godly art. In his horoscopes he must not dwell too closely on men's vices, but show some reason ; not make the hostile stars a personal reproach. He must hold himself aloof from the temptations of the shows, so as to avoid seeming a partisan ; God's priests must not be fond of pleasure. Arrayed in this armour of virtue, let him proceed, and, thus only, study the following books on the stars and the lot of man. No soul prejudiced and seared

with evil passions can embrace the Divine lore ; an impious mind injures itself thereby. Spotless, pure, and true he must do his holy work, and purity avails him more than knowledge. In the proem to the fifth book, Firmicus makes an impassioned prayer to God the Almighty, the ' Father and Mother of all beings, Father and Son in one kinship '. May God regard it kindly, if the author is moved by a higher impulse and a pure will to explain the courses of the stars and their influence : ' For Thy Romans have I written these books, so that, when all things have been rendered in their tongue, this may not be the only exception '. Then he prays the stars, the Sun and the Moon to forgive his intrusion into their secrets ; for no villainous curiosity or spirit of impiety impelled him ; only a spirit strong in the Divine inspiration, whereby he had to uplift to the Temples on the Tarpeian Rock what seers of Egypt had brought to light.

§ 4. AGRICULTURE—THE MARINE—SUBORDINATE OFFICES— MILITARY SERVICE

(i) *Agriculture*

This occupation Columella exalts over military service or the marine, commerce, usury, advocacy, clientship. Land in Italy only paid 6 per cent. ; hence, when interest under Augustus sank to 4 per cent., prices rose and land became a favourite investment. But little poultry, vegetable or fruit-farms, the crops of which were readily saleable at Rome, were rented higher : some fruit-trees near Rome earned 2,000 sesterces a year (£21 2s. 6d.) and flowers also paid well. In 227 A.D. a vegetable gardener on the road to Ostia paid 26,000 sesterces as rent. Such high prices induced many investors, including most of the landowners, to draw ground-rents in the shape of interest on small holdings : the *coloni* under the Empire throughout the realm formed a considerable part of the population, and sometimes (as their inscriptions prove) reached great prosperity.

Small holdings, were then, as now, in Italy, almost universal, and large holdings were only a mass of small ones. But, in the course of time, small rent-holders supplanted both small properties and even proprietary management ; Pliny the Elder, when he said that the large estates had ruined Italy

and the provinces, can only have been thinking of the replacement of peasant proprietors by peasant leaseholders. He was exaggerating even in this point, as usual, as is shown by two bonds, touching on Trajan's provisions for the education of the children of the free poor, for whom lands (at about twelve times their value) were mortgaged, in the neighbourhood of Veleia (near Parma) and Placentia, and near Beneventum. At Beneventum, peasant ownership still prevailed: out of fifty owners of mortgaged lands there are only two large owners (their estates amounting to 451,000 and 501,000 sesterces), nine owners of lands worth from 100,000 to 400,000 sesterces, the rest all having smaller estates (the Roman acre of 252 hectares of cultivable ground being valued at 1,000 sesterces). In Aemilia a far greater proportion of the former small holdings had been monopolized, 'as the rich country on the Po attracted capital, more than did the Hirpine Hills'. There out of 52 owners, half only possessed lands worth less than 100,000, and about as many estates varying from 100,000 to 400,000, and a fifth larger estates, three in this last category owning lands worth more than a million.

Vines were the most profitable form of cultivation. Seven *iugera* of vine-lands with the slave service, vine-stocks and the inventory, together with interest for the two years of waiting, cost 32,480 sesterces (£353 10s.), and Columella says this capital yielded 18 per cent., if well cultivated, not to mention the cuttings from the vines, so that despite bad years, expenses of management and accidents, the capital yielded a good profit, as the earnings of Remmius Palaemon show.

(ii) *The Marine*

Less certain, but more profitable was the Roman commercial marine, the flag of which was seen in every sea. According to Manilius' *Astrology* (circa 14 A.D.), the Crab initiated and favoured sea-trade. Those born under this constellation spread their over-sea goods through city and country, looked out for the accidental destruction of corn, and trusted their fortunes to the winds. The world was their vendor and their purchaser; unknown lands and unseen sunrises served them and their needs. Trimalchio, whose

wealth had thus been gained, ascribes his luck to the Crab. A corn-merchant (from an inscription on a statue erected at Praeneste 136 A.D. by his son) was well known in Rome and respected for his honesty: he made his purchases partly in Etruria and Umbria, but 'used eagerly to visit the safe havens of weary mariners'. The extent and variety of Roman commerce, which went far beyond the boundaries of the Empire, its dangers and its winnings, will be later examined in detail.

(iii) *Subordinate Offices*

The most sought after were the subordinate posts under the magistrates and priests. These were open to freedmen, and by them almost entirely filled. They were paid, and could be permanent, despite the yearly tenure of their superiors. These *apparitores*, on retirement, might sell their position to a successor. Hence, even in the Republic, these practically permanent officials had rights of corporation into *decuriae*, and, under good imperial government, this system of protection won their guild a certain amount of power. Almost exclusively they were the aristocracy of the freedmen. Trimalchio wishes to have it inscribed on his tombstone, that, had he wished, he could have entered any of the Roman *decuriae*.

The most reputed and best paid of them were the secretaries and treasurers, the *scribae*: but only the *scribae* of the quaestors were incorporated (into three *decuriae*) and those of the curule aediles (into one): both bodies being principally engaged in the administration of the *aerarium* (the Treasury and the Record office) and with the public book-keeping. With magistracies of one year, naturally, the substantial control would be with the permanent under-officials; and they could, through their knowledge of the law, of the accounts and the archives, and office regulations, not unfrequently lay under obligation the cities of Italy and of the provinces, which returned the favour in the form of civil rights and decrees of honour. But this high service was comparatively seldom in freedmen's hands: though they were not excluded: their sons were admissible, but knights also aspired to these posts. Just as the corpse of Augustus was borne on the knights' shoulders, the body of Drusus

the Elder was carried by the *decuriae* of the *scribae*. Vitruvius mentions the house of a scribe Faberius on the Aventine in whose peristylia the walls were covered with cinnabar.

Next to the *scribae* among the *apparitores* ranked the *lictiores* of the various magistracies, who formed three *decuriae* with a committee of ten. Sometimes they might be influential. To one consular lictor of the guild of the Divers and Fishermen of the Tiber (whose patron he was) a monument was set up, as he inaugurated a service of boats. Sons of over-lictors (*lictiores proximi*) are often knights. More powerful than the lictors was their fellow-officer and substitute, the *accensus*, whom the magistrate selected out of his own freedmen, to be his personal companion or intimate even. To one Lucius Licinius Secundus, who held this post under his patron, Licinius Sura, the powerful friend of Trajan, during his three consulates (98, 102 and 107 A.D.), at least thirteen statues were set up at Tarraco, by individuals and by corporations.

Lower than the lictors in this progression stood the *viatores* (messengers), mostly freedmen and meaner folk, but some quaestorian *viatores* were knights. The lowest of these were the *praecones* (criers), whose unesteem sprang from their opprobrious office. The inscriptions mention only freedmen and bastard *praecones*. Manilius' *Astrology* assigns an especial constellation to the talents requisite for these various dignities. Any one born under it knows his city, and as *praeco*, acts as broker to the state auctioneers; as *viator* or *lictor* arrests wrongdoers; as *scriba* cites State debtors. Further, *apparitores* of low standing often had a trade or handicraft, such as tailoring, oil-selling, pearl-dealing, or metal-founding.

(iv) *The Army*

Military service was the occupation most preferred by the people. The garrison of Rome, which under Vespasian consisted of nine Praetorian Cohorts, later of ten, and three or four City Cohorts (in all 13,000–14,000 men), was drafted solely from the free, but the militarily organized Fire Brigade (who were the night-watch and police, about 7,000 in all) from freedmen. The rank and file of the Roman garrison had higher pay and standing than the legionary privates. Service in the City Cohorts was for twenty years, at a

denarius a day, the Praetorian Guards receiving two denarii a day. Largess was a matter of right on special occasions. Claudius initiated the custom of purchasing their support, by promising them, at his accession, 15,000 sesterces a man : other emperors yearly, or at intervals of five or six years, used to make distributions.

But not only these advantages, the prospects of promotion and pension, the pleasure of soldiering induced men into the ranks : there was also the increasingly high social position. Like the higher ranks, soldiers were exempt from relegation to the mines or the rack. In a poem written about the beginning of the second century in praise of the army, the excesses permitted to the Guard are mentioned. Any assault by a Praetorian might neither be warded off nor judicially punished, and, in the court-martial of the regiment, no witness or evidence would be obtainable. Pertinax made the Praetorians furious, by forbidding robbery and violence.

In the provinces, the troops were no less arrogant. The legions were mainly raised by levies, but many entered voluntarily, induced by poverty and hatred of a regular life : preferable to them was twenty years of rough camp-life (from 17 to 37, under Hadrian until 42), unmarried, and often in the wilds on the frontiers. This long period of service no doubt hardened and uncivilized them : and the stinting of their pay emboldened them to rob. Quintilian warns the advocate not to censure whole classes at once, or, at least, to add something in extenuation. Soldiers may be greedy, but naturally do not rate their life cheaply ; impudent, as more familiar with military than civil life. The biographer of Pescennius Niger awards him special praise for repressing his soldiers from forcing gifts of oil, wood or labour. A tale in Apuleius' romance illustrates their arbitrariness. A legionary private in Macedonia met a gardener riding an ass, and brusquely addressed him unintelligibly in Latin. No answer was returned, and the soldier characteristically knocked him off his mount, and despite the victim's apologies, was going to appropriate the animal with violence. Entreaties are met with threats : the gardener simulates death, is robbed, and flew to a neighbouring town and shelter. Thither the soldier follows him, and conspires revenge : he and his comrades accuse the gardener of stealing a silver ornament of

the procurator, and the gardener is condemned and executed.

The most coveted regiment was the privileged body of the Praetorians; younger sons of the *honoratiores* and high officials of the *municipia* served in it as privates. But the admission was tardily granted; only the strongest and tallest were selected, and none accepted who was not at least five (Roman) feet ten in height. Any one falling short, be it by four inches, was drafted by Hadrian into the City Cohorts. Into the City Cohorts sons of freedmen were admitted, as were citizens of the City Tribes, who ranked between the full citizens of the country tribes and the freedmen, this class never entering into the legions or the Guard. Augustus gave these *tribules* of the second order no further right than to join the City Cohorts. The Roman garrison, however, was, at first, recruited only from Rome and Italy, under Tiberius from Etruria and Umbria, from the Latin cities and ancient Italian *coloniae*, which were first enfranchised 90 B.C. By the time of Claudius, Transpadanians were also admitted. Next candidates from provinces outwardly latinized were allowed in, such as men from Macedonia, Noricum and Spain, which, according to the tables of the Praetorian Guard, under Severus then amounted to 23, 18 and 13 men respectively, Pannonia contributing 11, Narbonensis 6, and Dalmatia 5. From this select force Africans, natives of the Greco-Semitic East, and the barbarian parts of the Danube, of Rhaetia, extra-Narbonese Gaul, Germany and Britain, were excluded, but such men could serve and the Africans especially in the City garrison, cohorts and fire brigade. In the second century the large majority of the Praetorian Guards were still Italians; the fragments of their lists show, 119/120 A.D., 102 Italians to 10 foreigners; 141/142 A.D., 36 Italians to 4 foreigners; 143/144 A.D., 260 to 12; 153/156, 47 to 2; 172/178, 60 to 15. So, too, with the City Cohorts; in a list of 197/198 A.D. there were only 16 foreigners in 172 men. Severus in 193 A.D. disbanded the Praetorians and reorganized them, and roused great discontent by incorporating veterans from all the provincial legions, thus filling the city with soldiers of savage semblance, rough manners and barbarous tongues. Now the Guard consisted mainly of Illyrians, Africans and Syrians. Their monuments, in bad grammar and poor writing, show how

R.L.M.

O

little their barbarous nature was affected or polished. 'Here lies Laudator', runs one inscription of a centurion of the Guard, 'a simple, honest man, whom Sassina bore; whom Aquileia lays to rest; who faithfully led a century of a Praetorian Cohort not of a barbarian legion'. The youth of Italy, debarred from the accessible service in the City, turned gladiators and bandits.

A man who started *ex caliga* (from the rank and file) could rise to be centurion, a position of considerable command. The *primipilatus*, or highest centurionate, was only gained by few, by those whose long military career under different suns, assailing the camps of the Moors and the fortresses of the Brigantes (in Britain), had earned them, unkempt, unwashed, this right in their sixtieth year. At this point veterans retired. They were called *primipilares*, and formed a special class, specially privileged and respected, and generally enjoying a fair competence on retirement; if they were not made knights, their sons always were; and, if veteran centurions in the cities of Italy and provinces set the tone, *primipilares* would be even more eminent. Augustus conferred on all centurions in honourable retirement the *toga* with the purple stripe and the rank of *Decurio*. Generally *primipilares* would hold the highest offices in the cities, and be the patrons of the communes, and by the Emperors be selected as civil officers and commissaries to city administrators (*curatores*). Further, as trustworthy men, they would be employed on important messages and services.

Moreover, the centurionate might be the stepping-stone to further advancement, in a two-fold fashion. Young men of the third, or second order even, began their military career, by imperial permission, as centurions, and, after serving three equestrian ranks (the praefecture of the cavalry, the tribunate of a legion or cohort, and the praefecture of an auxiliary cohort, and under Severus a fourth position as well), either left the service with the title of *a tribus* or *a quatuor militiis*, or, as procurators entered the administration, there to advance higher still. Knights, beginning service with this non-equestrian centurionate, temporarily lost knighthood, hoping to gain the honourable and well-paid officers' command, and the highly salaried procuratorships.

Besides this, soldiers who had risen to the *primipilatus* were

encouraged, in the Early Empire even, to enter the officers' career; the legionary tribunate being the next step, and after that the *praefectus castrorum*. Often they were appointed tribunes of the City Cohorts, but seldom praefects of the auxiliary cohorts. Later on the *militiae equestris petitores*, as they were called under Commodus, formed a special class, to which young knights might belong, but which gradually came to consist only of veterans, and these mainly Praetorian. This class, too, if knighted at a comparatively early age, might attain the highest posts of knighthood or even the Senate; though this ennoblement is not found before the end of the second century. No few names have come down, of whom it is known that they rose in one or other of these ways.

§ 5. CLIENTS

During all epochs in the history of Rome, the number of men living by clientship, wholly or partially, must have been very great. Tacitus, in describing the feeling at Nero's murder, emphasizes only two classes, the mob of the Circus and the theatre, and the uncorrupted adherents of the great houses, the clients and freedmen of the banished and condemned. This division may be incomplete, but it illustrates the extent and significance of *clientela*. The *clientela* of old was a *pietas*, a sacred obligation; its later echo a mere relation of master and servant. The ancient client was, as Ennius testifies, the faithful follower and even confident of his patron, who protected him: now he had become a scurvy, ill-paid attendant in his lord's or 'king's' retinue.

In the later Republic, the old relation might survive, as in Horace's description of the Consular Lucius Marcius Philippus, and Volteius Menas. Philippus takes Volteius, for his personal qualities, into his house, acting on information that he was a man of small estate, but blameless and merry, and that his society would relieve the overstrained business man: as a companion, he makes him his daily associate, and gives him a wherewithal to live. But soon this personal relation came to an end, with the increasing number of the clients, and the ceremoniousness of their position. The Republican tradition of every distinguished man having a retinue commensurate with his rank, to fill his *atrium* every morning, to accompany him on all public occasions, and

generally to invest him with splendour, became more and more common, more and more exacting, even on less wealthy men of business : all must have their clients, surrounding their sedan-chairs, refuting any imputation of petty commerce ; and a great number of needy men was at the cheap disposal of the train of a rich or eminent man, or of the Emperor. Each service had its fee, generally paid in kind or in money to buy food. And competition was always lowering the pay. In Martial's day, clients complained of the close-fistedness of the great, and cast envious gazes on the generosity and affability of the Mummii and Pisones, the Cottae and Senecas of the olden times. The spirit of aristocratic pomp and patronage had changed : and, even if antiquity may have been enhanced by regretful memory, at least one contemporary of Martial and Juvenal did find the condition of clients a miserable one.

Besides the regular fee in kind or money, clients received other occasional benefits, such as a casual invitation to an empty place at the patron's table, a rare and valued recognition of long service ; or, perhaps, presents : a worn-out cloak, a shabby *toga*, sometimes a thousand sesterces, or a few acres of land, as a final requital of lifelong attachment (wherever Martial mentions the meanness of the rich to their poor friends, he is thinking of the clients). Such was Martial's little estate of Nomentum, perhaps out of Seneca's property. In one of his last Roman poems, he indulges in comic exaggerations of the diminutive size of an estate given him by his friend Lupus. It was smaller than the flower bed outside his window ; a cricket could cover it with its wing, too short for a cucumber to lie straight in, its harvest might fill a snail-shell, its must a nut-shell. Others found it wiser to appoint old clients to the supervision of their estates, 'fee'd henchmen', says Columella, 'too old to do daily service', and wholly incapable of conducting what they superintend. Sometimes the patron gave his clients and freedmen free lodgings ; but loans, guarantees, legal help and general protection seem to have been regularly expected and received. Paetus Thrasea was impugned for devoting more time to the private interests of his clients than the public affairs of State. But, as a rule, clients made a poor living ; many were fed on great expectations ; 'few', says Martial, 'got much in the *atria*

of the great ; most were pale for hunger '. Yet many again sought the service, even of poor men : ' how much stupidity the Roman *toga* covers up ! '

In Martial's day, clients were paid the wretched sum of 6½ sesterces a day, barely sufficient, with other advantages, to support a client, and this had to be laboriously earned. The most arduous task, and the most essential, was to wait on the lord or king every morning, and to help to supply the social requirement of a full *atrium*. This would be in the first and second hours. But clients had to be punctual, if anything, to wait for admission, however far they had had to come : generally they started in the dark to visit friends on the way, who did not return the call ; often having no time for sleep or digestion. According to Juvenal, ' as soon as the stars begin to dim, or whilst tardy Boötes is still moving in the heavens, the poor client rises from his bed, in haste forgets to lace his shoes, anxious lest the host of visitors have already run their orbit '. And Martial, too, bitterly complains, that, in return for his little poems, he demands little more than to have his sleep out ; and he may not ; these endless troubles in this ill-paid service drove him out of Rome, and, at home, he found repose once more. A further inconvenience was this : the client had to present himself to his patron in the *toga*, the costume of state and ceremony : it was a hot, cumbersome cloth cloak, disused more and more at Rome after the beginning of the Empire, and soon to be the garb of the clients only, and no slight expense, as in summer four or more even would be worn out. In this accursed *toga* they went their ways, before daybreak, in streets empty, save for bakers, who were hawking their goods, their first customers being boys, going lamp in hand to school, or meeting roysterers coming home from a late feast. Wind or hail or snow, no inclemency that deterred others, might deter them. Add to this the dirty streets, the long distances, for many had to pay several visits, and, as the day advanced, the obstruction of the growing traffic, and the dangers in the narrow tortuous streets from the overlaid waggons. These daily inconveniences in themselves made this mode of life intolerable : Martial makes one client plead gout to excuse himself from the daily visit.

This early call, being their principal obligation, gave them

the names of *salutatores* and *togati* ; but many had to work on most of the day, or even all day long, in the *cortège* of their lords, following or preceding his sedan-chair, accompanying all of his visits whatsoever, at the tenth hour repairing with him to the *thermae* of Agrippa ; whilst they had to take their baths at the Baths of Titus, a half-hour's distance. They had to elbow themselves forcibly through the crowd. If their lord was travelling into the country or abroad, they had to be in readiness to take an empty place in his chariot. Were he reciting his poems, they had to give, by gestures or otherwise, the signal for the applause of his audience ; were he pleading in Court, the collective bravoës of the *togati* manifested, as Martial says, the eloquence, not of the orator, but of his scullions. Once an especially patient client was dining with the hot-tempered orator Caelius Rufus, and still found it hard to keep the peace. At last the continual assents wearied Caelius, and he exclaimed : ' Do say no, once at least ; so that people may know we are two people here '. Nor was their work always innocuous. Sometimes they had to be the tools in plots, the discovery of which spelled ruin to all participants. In the year 55 Junia Silana used her clients Iturius and Calvisius to implicate Agrippina in Nero's eyes in an attempt on the sovereignty. The conspiracy failed and brought banishment to Silana, and relegation to the clients. In Pompeii clients agitated in the city elections of their patrons. Sometimes the clients of a great house combined, to set up in his *atrium* a statue of their patron in his honour.

Not only from the lord, but from his slaves as well, clients had to endure bitter humiliations. Columella calls their profession the lying 'bird-catching' of the 'paid visitors', who swarm about the threshold and learn from hearsay how their king has slept. For often the slaves vouchsafe no reply ; often must he be repulsed by a chained porter and lie outside like a dog. If they had some urgent business, and could not afford to be put off by usual pretexts, of the master being out, or being shaved, or busy in preserving the first hair shorn from some favourite slave, then they must bribe the haughty slaves, who thus derived much tribute from the scant earnings of these poorer clients. And, after getting through the half-opened door, once inside, they still

had to face 'the pride of the announcer and the frown of the chamberlain', and make greater efforts still, to gain admission. Usually, the great man received the greetings in a preordained order, and made no return salutation. 'How many', says Seneca, 'still wearied out from yesterday's debauch, will only yawn a haughty half-heard answer to the poor men, who interrupt their night's rest, to wait on a stranger?' It was a condescension to remember the humble visitor's name. But the client had to meet his patron with the greatest reverence, to address him as lord and king, were he not to fall into disfavour, and lose the desired reward. The patron showed his 'friendship' at most, by freedom from restraint in his client's presence. Often lifelong service would change nothing in this respect. The 'happy friends' only understood being enraged, and thereby profited, for hatred is cheaper than generosity: the Roman grandees easily put up with the loss of a client; and clients were often burdensomely officious to their patrons. But the patron who exacted slavishness could expect no love.

Their greatest humiliation was, however, at table. Juvenal's fifth satire deals with this; the general accuracy of his description is confirmed by Martial and others. In many houses clients and other humbler diners were accommodated very differently from the masters of the house and his guests, in food and drink. Their lower standing was made painfully evident. Pliny the Younger warns a young friend against such a combination of luxury and meanness; at one house where he had recently been entertained the wines for the guests, the 'lesser friends' and the freedmen were of distinct brands. Pliny, in the course of conversation, remarked that at his table, all, including the freedmen, fared alike: his neighbour remarked that it must be costly: Pliny rejoined that he drank the same as his freedmen, not his freedmen the same as himself. Martial makes the patron dine off Lucrine oysters, the finest mushrooms, a flounder, a fat dove or thrush, whilst the client had watery mussels, bad mushrooms, poor fish, and a magpie that had died in its cage; the client drank new Sabine out of glass, the master an old vintage out of a *murrha* vessel; *murrha*, says Martial, being opaque and obscuring the liquor. And yet the rich marvel that friendships no longer exist, like those

of Pylades and Orestes—who shared the same food. To have love, they must follow a piece of advice of the Stoic Hecaton, mentioned by Seneca; they must show love themselves. Juvenal paints a similar picture. The patron drank out of costly vessels: but if such a glass were given to a client, he was closely watched and the jewels counted, or he was given a broken earthenware jar. The fairest youth of Little Asia waited on the lord: on the client some African runner, or bony-handed Moor, an ill fellow to meet of nights. Slaves demurred to obeying or tending an old client, and were jealous of his sitting while they stood. They would hand him stale bread; the good white bread was for the master, and the client was repulsed if he ventured to touch it. The lord had a lobster, asparagus and fine oil; the client a Tiber fish, with lamp-oil. The client dare not drink his lord's toast; dare not open his mouth, for fear of ejection, must acquiesce in being the laughing-stock of his lord or his guests. The author of the *Encomium* on Piso says that the poor clients had thus to earn their scant livelihood, and says of his patron's house that there 'nobody's insult would arouse general laughter'. In the fifth century, Valerianus, a Bishop in Gaul, expresses indignation at the giving of broken dishes to poor guests, at their beards being plucked, their chairs being taken from under them, and their being provoked to fight, so as to amuse their host.

Epictetus confirms these descriptions, mentioning the hubbub and morning visits as characteristic of Rome. A client should show equanimity, if not invited to a feast, or being given a back seat. The few honoured paid dear in morning visits, bearing the patron company, and flattery. Any one seeking access to a rich man must expect to be repulsed or shown the front door, or to have to kiss his hands.

Few facts are known as to the *clientela* of the second century, though no change need be looked for, despite the vanishing of the old aristocracy after Nero's reign, and the rise of new municipal and provincial families. In the second and third centuries, the number of noble families was probably undiminished, and, no doubt, these mushroom senators derived no fewer advantages from riches and influence than their aristocratic predecessors. The clients had the same duties. Fronto says that Gavius Clarus the senator, from youth onwards, showed the

same readiness to oblige him as a faithful and zealous freedman. Galen makes out a prescription for the many, whose unquiet life forced them before daybreak to knock at their patron's gates; who often arrived in a sweat, and then took cold, who attended others at their bath, and accompanied them home; themselves bathing and dining in haste. Tertullian repeatedly reprobates the cringing patience of these slaves of the belly, these thralls of rich favourers. Lucian's *Nigrinus* seems to show that the barrier between clients and patrons had broadened, and one side was slavish, and the other domineering: he may be rhetorically inexact. But essentially nothing had altered since the first century. The clients still had to rise at midnight, run about the entire city, be shown the door by slaves, and bear the most unseemly abuse. And the rich still strutted about in purple, poked out their beringed fingers, and were tastelessly, needlessly ostentatious; their accosters had to be content with a stare and a word from a follower. Prostrations even did they demand, like the Persians; when they are near, men must bow to them, and when they are afar, must humiliate their souls and wear lowly garments; and kiss their breast or their hand, and be envied this honour. And the reward was a contemptuous entertainment, the guests being often, unwillingly, forced into drunkenness, and going back home, cursing their host, loathing his stinginess, and hating their humiliation. Then in the street-corners, they would begin to vomit, next day be ill in bed, and have doctors—if they had time at all to be ill.

Most of these willing slaves were men of low standing, 'people with ragged cloaks', as Juvenal says: generally freedmen acted as clients to their patron, or even soldiers. Claudius prohibited soldiers from waiting on senators, but more out of fears for the stability of his throne. Lucian, too, speaks of the crowds of soldiers, who would not wait in the *queue* but elbowed their way through. Many, too, who had been better off, kept up a scanty old age in this fashion. Such were Junia Silana's clients, Iturius and Calvisius; they, after consuming their whole fortune, at their patroness's behest aided the indictment of Agrippina. Even men of education could be forced by hunger to mingle with these rude retainers, such as Publius Egnatius Celer the Stoic, a client, and afterwards the accuser of Barea Soranus,

Martial, a knight, and the youthful author of the *Encomium on Piso*. According to the latter only few houses had literary or scientific men as clients: he was fortunate in his lot. For Piso had no pleasure in crowds of boors, who could only offer mere service, and had only wit enough to precede and make room for their lord. In his house the poor friend was not contemned, and the client not downtrodden.

But, especially in earlier times, when clients were more than paid footmen, patrons, too, had some responsibility and grievance. Many had no leisure from their crowds of clients, or, as Horace says, had to slip out by a back door, whilst they waited in the *atrium*; a course Seneca deemed crueller than refusal. Their requests he had to listen to; they gossiped anywhere and everywhere of his family secrets. They brawled at his table and fought with his freedmen. At the *Saturnalia*, on New Year's Day and his birthday, they brought little presents, serviettes, spoons, wax lights, paper, baskets of Damascene plums, angling thus for larger returns. The poor man, says Martial, is most generous to his rich friend, when he gives him nothing. But the speculation did not always come off: 'the patron's gold was seldom heard rattling'. Instead of his expected rent money, the client might receive a flask of wine, a hare or game. Every slave also claimed his share, or commission on the present he carried. Eight brawny porters, says Martial, on the *Saturnalia*, dragged a number of articles into his house, scarcely worth thirty sesterces in all; one slave could far easier have carried five pounds of silver. And then the poor man had to extol the gift to the skies, whilst his was contemptuously cast aside. At the feasts of the *Saturnalia*, all the clients were entertained at once, and Lucian almost literally reiterates all Juvenal's complaints at their treatment at table, but adds that their behaviour often justified it.

§ 6. THE FREEDMEN

In conclusion it must again be pointed out, that the importation of slaves in masses from every part of the Empire, as well as from beyond, out of whom every year hundreds or thousands were freed and entered the third estate, rendered the population of Rome extraordinarily cosmopolitan. Of the tombs that line both sides of the military roads from

Rome, more than half belong to freedmen. The 80,000 citizens whom Caesar settled in various places beyond the sea, seem to have been mostly freedmen, as was certainly the fact in Corinth. Some indication of the extent of manumissions may be gathered from Augustus' restriction of testamentary manumissions—and he limited them as far as he might—to one hundred. Further, free provincials were always immigrating in masses, especially from the South and the East, and thrusting the original Romans out. Lucan even calls Rome a city filled with the scum of every nationality. Rome, said the Romans of the second century, was Greek, but populated not from Greece, but Little Asia and the East; the Orontes (the chief river of Syria) had flowed into the Tiber. Athenaeus (circ. 300 A.D.) says that the cities in Rome were innumerable; whole provinces, such as Cappadocia, Scythia, Pontus, were there settled. The huge number of Orientals may be gauged by the numbers of the Jews. An embassy of Herod to Augustus was accompanied by 8,000 Roman Jews: in 19 A.D., 4,000 freedmen of military age were deported to Sardinia for 'infection with Jewish and Egyptian superstition'. The volume of immigration increased: the true Roman free-born decreased by commixture; in 24 A.D., a revolt of slaves was anticipated, and Rome felt serious apprehensions at the limitless growth of her slave-class, and decline of the free-born *plebs*. Augustus limited legal manumission and recommended to the Senate and his successors the same advice, 'so as not to fill the city with all sorts and conditions': but freedmen multiplied and Rome's population was heterogeneous and chaotic.

The freedmen foreigners were often very wealthy. Their riches were in part derived from service in great houses, in which Greeks and Orientals ingratiated themselves, or made themselves indispensable or dreaded as acquainted with shameful secrets. In part their opulence came from their Oriental industry and skill in commerce. Juvenal makes one rich freedman, his Euphratian birth-mark betrayed by the pierced lobes of his ears, demand precedence over praetors and tribunes; for he had five shops that brought him in 400,000 a year. Trimalchio tells of how he, as a boy, came from Asia to Rome and was for fourteen years his master's darling, and on a very good footing with his mistress; and

he was not in the habit of boasting. Thus, by the grace of the gods, he became master of the house; he was made co-heir with the Emperor, and a senatorial fortune left to him. But contentment is not human; so he went into business, built five ships, freighted them with a wine, then worth its weight in gold. Unfortunately they all stranded, and Neptune drank up 30,000,000 sesterces. But nothing deterred him: he built bigger and stouter ships; loaded them with wine, bacon, beans, perfumes and slaves: in one voyage made 10,000,000, bought back all the property of his former master; built a palace at Naples; at last owned more than his native city; retired from business, and now let his freedmen earn for him. His tombstone was to be inscribed: 'a self-made millionaire: I have left an estate of 30,000,000 and never heard a philosopher'. His fellow freedmen are 'people to be respected': one of them began on nothing, as a carrier of faggots, and now has 800,000; another's credit is momentarily shaken, but has been worth a million. Petronius does not exaggerate, he draws from life. Demetrius, a freedman, is said to have left 4,000 talents (£943,050); and Didymus and Philomelus, the richest men at Rome in the time of Domitian, must have started as slaves. Freedmen's wealth was proverbial at Rome, even in the Early Empire, as also their tastelessness and impertinence and ostentation. Of Calvisius Sabinus, whose riches were as great as his ignorance (he was consul in 26 A.D.), Seneca remarks he had a freedman's properties and proprieties. On freedmen's tables vessels glittered, 'on which a whole silver mine had been expended'. In their baths, statues, columns, waterfalls abounded, all decoratively useless. The mirrors for their daughters' vanity cost more than the dowries of the daughters of the statesmen of old. In sybaritic luxury they excelled the most eminent: in all the greater contrast stood their vulgarity and ignorance. They, who once had feared the whip, who now plastered weals and brands over, or bribed physicians to silence, to take the marks out,—they were now to be seen in snow-white *togas*, Tyrian purple, scarlet shoes of the finest leather, their fingers gleaming with jewels, their hair scented, and on the front benches of the Theatre of Marcellus. Their predilection was to treat their betters with disdain. The rich freedman

was the type of the common upstart, shameless and boastful. Zoilus in Martial represents him, like Trimalchio : he wears heavy rings, almost as heavy as his former leg-irons ; uses a monstrosly big sedan-chair : malingers to show off his Egyptian bolsters with purple coverlets and scarlet quilts : enjoys the costliest wines and foods himself, whilst giving his guests common stuff and leavings : his snoring at table must be respectfully listened to, in silence : any one happy at such a feast the poet deems worthy of his beggar's bread. The self-complacency of this class was increased by the sight of the power of their peers at Court, and the reflection of that Court-glory on themselves : their sons and grandsons often attained high posts as knights and senators ; even in Nero's reign many such families were of servile descent.

But beside this ostentation of these former slaves, no few showed a nobler pride, the pride of the low-born but able, as against the *fainéant* rich. Cicero, in the heyday of aristocracy, dared only hint at the superiority of the middle-class : 'the nobles in their excess of good and evil quite outdo our potentialities'. Two hundred years later, when the nobles had been depressed by monarchy, Juvenal accentuates the value of the lower orders. 'Catilina and Cethegus, with all their blue blood, aped the Gauls in attempting to fire the Capitol and had to be curbed by the ignoble new man of Arpinum, who, at Rome, had been only an obscure knight before ; free Rome hailed him *pater patriae*. And another man of Arpinum it was who had earned his daily bread in the Volscian mountains, when weary of working on others' soil ; and he later swung the centurion's whip on to a soldier entrenching but idly. And he, as consul, checked the Cimbri and saved the panic-stricken city. Hence his noble colleague was only awarded the second laurels, when the ravens flew over the battlefield, and fed on the gigantic Cimbri. The Decii, in name and soul plebeian, were the accepted sacrifice of the Nether Gods. The last good King of Rome was the son of a slave ; the sons of Brutus the consul traitorously opened the gates to the banished tyrants, and were loyally betrayed by a slave. However far your family-tree go, your first ancestor was a shepherd or a robber, one who found refuge in Romulus' camp. In splendid palaces indecent Andalusian songs and dances are found seemly.

Dice and adultery are the shame of the humble, the sport of the great ; the guilt of the cobbler and glory of the noble. From the depths emerge the eloquent, who defend the ignorant nobility, who solve the riddles of the law, and the martial youth who, under the eagles, guard the Euphrates and the Rhine : the nobles are as useless as the armless busts of Hermes, with only an ancestry to boast of, and devoid of sound sense.'

But how strength arose from out the lower ranks, and the weaker upper orders sank and decayed : how the three orders of societies, to a certain extent, regularly interchanged in constant succession, this fragmentary account from few and scattered sources can give no sufficient idea.

CHAPTER IV

ROMAN SOCIETY

THE interaction of Society on Court and Court on Society has already been mentioned, but can only be imperfectly described, in part only conjectured. *Clientela* corresponds most closely to the Court ceremonial of visits. And the *officia* or social obligations were very various and could not be disregarded by any one in Society, and least by the prominent members : ceremony, developed and extended, became subject to stricter regulations.

I. As in great houses, receptions were held in the early hours of the morning. The Roman day assigned all business to the daylight, and in the afternoon brought it to an end at the principal meal ; hence the dawn only was left for most social obligations. Every morning, then, the Roman palaces re-echoed to the sound of many feet ; the clients, in dirty *togas* and cobbled shoes, clattering up even earlier, in such numbers even as to cause an obstruction in the street. Sedan-chair carriers, in red mantles, like soldiers, would hurriedly carry a rich man along ; he would be enjoying some sleep behind drawn curtains, and his clients walking all around him. The well-known cry of the lictor would be audible, making room for a consul, and, to the lictors with their *fascies* and the servants who knocked at the doors, preceding the high dignitaries in purple *togas*, the crowd would give way. Or a needy Greek applying for the position of teacher in a noble house, and overdressed—beyond his income—imitating the costume and tastes of his patron, would come by ; or, in the days of Marcus Aurelius, a Greek philosopher in a rough cloak and long beard, anxiously trying through a slave to secure an invitation to the table ; or a senator, ambitious for a consulate, a knight soliciting a

legionary tribunate—all, as Plutarch says—like a swarm of flies round the coveted honey. Seneca remarks, no doubt from experience, that many seldom visited men to whom they owed gratitude, and, to avoid seeming clients, succeeded in being ungracious. At the door stood the porter with a long stick ; his goodwill generally had to be bought ; sensible men, says Seneca, regarded him as a toll-collector on a bridge ; others forcibly broke their way in, answered him gruffly, or begged his master to give him a whipping. People of lesser standing were simply shut out.

The *atrium*, where receptions were held, was a columned hall with an aperture in the ceiling, and, in noble houses, very capacious. There were benches for those who had to wait : on New Year's Day, 31 A.D., a sofa in Sejanus' palace broke down under the weight of the multitude that came to congratulate him on his consulship ; it was taken as an omen of his imminent fall. The rooms were gorgeous, lofty, and huge, shining with marble ; ancestral portraits covered the walls ; the lackeys in magnificent livery : a mass of splendour, likely to dazzle the unsophisticated stranger. The principal slaves and freedmen had to be managed or bribed : the *Nomenclator* or announcer required long written lists, despite his selection as a good memorist. As at Court, visitors were divided into first-class and second-class : inside there were many doors open, but to the few, friends or favourites ; fewer still could enter the reception-bedroom and be at the levee : most were greeted in the *atrium*. When Plautianus (Cassius Dio says) summoned his friends before the rest, one Coeranus followed them to the last door : this was shut in his face, but he secured the desired impression. Court-receptions were very similar. The door of Sejanus was as thickly beset as the palace : no one but feared he might come late or not be seen : senators paid homage to his clients, and courted his freedmen and porters. Plutarch says that one who has a great crowd to greet and attend him is deemed rich in friends. In 62 A.D., Seneca, to disarm Nero's suspicions, abandoned his splendid manner of living, and the morning-receptions. Great advocates enjoyed this satisfaction of seeing the most eminent visit them. When the reception was over, a great wave seemed to roll out of the palaces.

The custom of patrons holding morning-receptions and going out accompanied by their clients continued until the end of the Empire. Tertullian (circ. 200 A.D.) says that competitors for an office used to assure themselves of a place in all the *atria*, by waiting during the night. Firmicus the astrologer (circa 350) speaks of people who visit every house they can. St. Jerome in his letters from Rome (382-385) says: 'I am ashamed of the many visits we make or receive', and Symmachus (about the same time) also speaks of the nightwatches outside the doors of the rich. St. Orientius describes (circ. 450 A.D.) how an applicant gets up before daybreak, waits outside the rich patron's portals, falls asleep, or is moved on forcibly by the lictor, unless he bribe the porter. Sidonius Apollinaris praises two distinguished consulars who always went out with a numerous following of clients, because access to them was easy and inexpensive. Paulinus of Périgueux in a poem (A.D. 460) describes his honourable escort of humble clients.

Not only formal visits, then so many more than now, but a number of festive occasions, requiring the presence of guests, took place in the early morning. Such were the assumption of the *togâ virilis*, betokening a boy's maturity physical and political. The Emperor Claudius, who during his boyhood had been persistently slighted, celebrated the usual sacrifice on the Capitol, and was carried there at midnight without the usual company, to avoid publicity. At weddings, too, the houses of both parties swarmed with guests before daybreak. Thus, too, betrothal feasts were celebrated in the first and second hours of the day, so that those invited lost the night's rest needed for digestion. But the rule requiring all who had any connexion with a new magistrate, to attend on his day of inauguration at daybreak was especially strict; the solemn procession of the friends, relatives and clients to the Capitol attending consuls or other dignitaries is often mentioned. Hadrian used to attend his new consuls and praetors on such occasions; and Verginius Rufus, the great patron of Pliny the Younger (he was thrice consul: his death occurred in 97 A.D.), used to come to town on every new elevation of Pliny, though he generally refused such functions. Corellius Rufus (died circ. 97 A.D.) also used to accompany Pliny the Younger on such occasions.

R. L. M.

P

Pliny formally apologizes to Valerius Paulinus for his absence on the day of his consulate: the letting of his estates was occupying his personal attention. This letter shows what a slight non-appearance was considered. Many, too, says Martial, took pleasure in these duties, and were seen in the retinue of any and every new consul or tribune; and Ammianus Marcellinus observes that pedantic critics of history thought all the names of persons should be catalogued, who formed the new City Praetor's retinue.

Other multitudinous functions, such as funerals, took place later in the day, and persons with many social ties found these obligations very consumptive of time, whilst to fulfil all was impossible. Plutarch says, the many friends of any one man may each demand assistance as advocate, or assessor, or commercial advice or presence at a wedding or funeral, all at the same time. Want of memory or knowledge is a better excuse than necessary praetermission of one duty by another, e.g. neglecting a sick-bed visit for a banquet. Martial had to be about before the dawn to pay visits and offer congratulations, none of which were returned. Then he had to witness a document with his seal at the Temple of Diana, had appointments for the first and fifth hours, was claimed by a consul or praetor, or had to listen to poets' effusions all day long. And no one dared refuse to attend the addresses of an advocate or grammarian or rhetor. At the tenth hour (the second before sunset) he came tired to the bath, having no time over to compose. 'It is curious', says Pliny the Younger, 'how in Rome one's account to oneself of every day seems fully made out on every day, but never after that day. The ordinary day is filled up with such functions as the taking of the *toga virilis* by a friend, a betrothal or wedding, a sealing of a will, assistance in Court or Session; all inevitable on that day: all seeming a waste of time on consideration, especially after leaving Rome'. These 'sessions' are judicial: magistrates, praefects, aediles, used to invite their friends to sit as honorary assessors. Pliny also mentions social engagements sufficient to occupy the day. Plutarch and Martial specify other promises, more exacting still, such as the witnessing of wills and deeds. Pliny tells of how one Aurelia put on her best on making her will, and one witness Regulus actually asked for her garments

as a legacy. 'Why', asks Seneca, 'are these dandies invited to seal the will? In order that a man may not deny receipt of what he has received'. The legal making of wills and manumissions required the presence of many witnesses, who were ranged in order of their standing, social and personal. A most rigorous *étiquette* governed the order of guests at table. Seneca calls those fools who get angry at a lower seat being given to them. This order of the semicircular dining-sofas lasted down into the Middle Ages.

Birthday congratulations were another frequent social engagement, as also sick visits and condolences: Regulus, a well-hated man, had all Rome on his heels to condole with him on the loss of his son. So, too, a new official had to be congratulated, or a new provincial governor escorted. An assessorship might last for days, and canvassing for a candidate whole weeks. But recitations by authors were the most wearisome and prolonged obligations: in spring or summer they might take weeks or months: Juvenal puts them in the same category as fires and collapses. On such occasions, clients, friends and the most distant connexions had to attend. Cicero says that to accompany the sons of the least considerable men to the forum to assume the *toga virilis*, men would come from afar, and similar obligations obtained, though perhaps in a less degree, under the Empire. From the desire of assembling very many at such festive occasions, and showing proper gratitude, the custom arose of making monetary gifts, which was established by the beginning of the second century.

In this social whirlpool, self-life became impossible: deeper natures fled into the country to have solitude and freedom; but not all might thus rescue themselves: Seneca is eloquent on the unprofitable and vain life he must lead at Rome. No one, says Martial, has control of his own time in the wayward currents of City life: life is fruitlessly passed away. But busy leisure here found its greatest joy. In the Early Empire even, very many passed their lives in useless ceremonies; as a conspicuous class receiving the new name of *ardeliones*. In his *Astrology*, Book II (temp. Tiberius), Manilius says that those born under a certain constellation will be lively, nimble, indefatigable in rendering services, filling the city like a people, crossing thresholds, friends

of everybody, ceaselessly congratulating in identical words. Another poet under Tiberius speaks of the Roman nation of the *ardeliones*, ever idly busy, ever profitlessly out of breath, useless busybodies, a nuisance to themselves and a bore to others. Seneca compares these men to ants running aimlessly up and down the walls of houses, theatres and *fora*. Their life is one restless inactivity, a semblance of business, devoid of purpose, out of doors by every new dawn, to make the streets more impassable. What they want they do not know; they only propose paying calls, or doing something. One must compassionate them, running about, as though there were a fire, and tumbling into each others' arms. And their object? To pay unreturned visits, to follow a funeral of a stranger, to attend the last suit of a litigious person, or the last engagement of a much-married lady. After these futile scamperings, they come home, not knowing why they have been out, or where; and to-morrow *da capo*. Even old men tottered about Rome, weary and sweating with Rome's kisses: hoary old men, who daily made the circuit of the City, greeted every lady in her chair, every new tribune, every new consul, and ran up and down the Palatine ten times a day, mouthing the names of the favourites of the Emperor. 'Young *ardeliones* have some grace', says Martial, 'old ones have no excuse'. One hundred years later Galen describes the Rome of his day: in the morning every one visiting every one: next, the crowded law-courts in the forum, the tumultuous hangers-on round charioteers and pantomimes; nor fewer who pass the day flirting, gambling, in the baths, toping, and, in the evenings, banquets, not for music and not serious; only for carousals, till dawn breaks anew.

II. At Rome there were many *ardeliones*, but also many genuinely busy for profit, material or otherwise. Pelf was the genius of the noisy, restless striving which daily filled the streets and palaces; one universal chase after money as the original good, whence were derived rank, respect and honour. The complaint was just, that wealth was the sole criterion and the one aim of Rome; for the poor ever sank inextricably deeper (otherwise, says Umbricius in Martial, they would all have emigrated); and, further, Rome was a rigid plutocracy. Hence, says Pliny the Elder, came the downfall of all that lends life real value: turpitude was

the best means of advancement, a goddess served in many individual fashions : but one and all agreed in striving after riches alone : the most distinguished even paid more honour to foreign vices than native virtues. 'Be it', says Juvenal, 'that to Gold the Fiend we have no temples erected, no altars to the jingling coin, yet Mammon is enthroned supreme God'. Galen, too, complains of the loss of all ideals.

No one, not blind or purblind, could not see how, under specious shapes, there lay mere selfishness and materialism. It was an open secret at Rome that the most wide-awake and zealous of the *officiosi*, or dandies, were professional ghouls-in-waiting, flattering their expected testators, anticipating astrologically their decease, bribing doctors to hasten death on—a reproach hurled by Pliny the Elder against medicine. The extent of this professional fore-measuring of dead men's shoes casts a lurid light on the mendacity of the Rome of that day. Not only adventurers and speculators trod this path to fortune, for the upper classes were unnaturally barren. Even in the Republic, marriage was a burden, undertaken only from patriotic motives. The Civil Wars undermined the crumbling moralities permanently : and the remedies of Augustus could only be superficial, not radical, and failed. In vain he fulminated rewards to matrimony, and punishments to celibacy and barrenness. For the childless had too much advantage in the power of ceding an inheritance : to comfort and calm they could add the pleasure of envy and adulation.

As early as Augustus' reign, this reversionary speculation had become a systematic art, with its adepts and novices. Seneca includes in this class the two senatorial orators Lucius Arruntius and Quintus Haterius. Satire dwelt on the relations between the holders-on and grabbers of inheritances. One of Horace's wittiest poems makes Ulysses ask the shade of Tiresias how he might make up for the damage done by the wooers, and is advised how to qualify to put on dead men's shoes. Every feature of the art is found here, and afterwards is only reiterated, how the huntsman ingenuously tracks his quarry down, and the quarry cunningly offers false baits of hope. Little attentions, great personal services—there was nothing they might not exact, presents of delicacies, fruit, pastry, fish, game, wine : it was an expensive specula-

tion. Martial advises one Fabius not to grieve at the failure of Bithynicus to leave him anything, as his death amounted to an annuity of the 6,000 sesterces he had been every year spending on him. The health of the rich was narrowly observed. If ill, they were sure of the kindest nursing, even of being washed and having their noses blown. If they recovered, prayers and offerings, ex-votos on the temple walls, horoscopes that were cast, and, says Juvenal, sacrifices of elephants and men. If a friend's house suited them, it was promptly given away to them; their losses through fire were amply compensated. Advocates rushed in to defend them in need, and desperate must their cause have been, if they lost. In 58 A.D., Pompeius Silvanus, the proconsul, was indicted for maladministration in Africa. Despite his many accusers, his wealth and childlessness bought an acquittal, but he survived his interested friends. The verses of rich old men were panegyricized: their recitals crowded: such as Annaeus Cornutus (banished by Nero in 68), whose philosophy lectures were packed by students of his material wealth. Their most patent lies were credulously swallowed; at dice they always won; their every frailty was subserved. Ladies never refused their offers. Their *atria* every morning hummed with the most prominent men. Martial specifies as one of the clients' duties to accompany his rounds to ten old crones. A praetor, says Juvenal, in early morning hurries his lictors on, to forestall any competing colleague at Lady Modia's or Mme. Albina's. Difficult as it was to outbid all rivals and vouchsafe a rich man's every whim, it was still harder to keep up a specious disinterestedness. Keen were the wishes for a happy return and a long life, for the birth of an heir; legacies were given, in the expectation of similar bequests; the number of these provisions provoking a law for their invalidity. Many suddenly stopped their benefactions, after ascertaining, from the will, that their object had been gained; but, as Martial says, the meshed-in boar might burst his thongs, if the fodder were withdrawn.

All these despicable servilities might be frustrated by the schemers' own predecease or their being outwitted. The owners wanted to feed the hopes of the hankerers without satisfying them, to prey on their officiousness, and withhold the booty. Ever and again, the promise of a will: wills

were made twenty or thirty times a year. They would pretend illness, cough; Pliny tells of one Julius Vindex—the man who very ably undertook to rid Rome of Nero—who did not hesitate to attract his would-be heirs by using a drug for artificial paleness. 'Tongilius', says Martial, 'has fever every other day: but he really is only hungry and thirsty, and simulates diseases, so as to hook in fat thrushes, pike and barbel; to be able to reckon on supplies of good Falernian and Caecuban'. A past master, even if poor himself, might sometimes secure these advantages of the childless rich, and make a great show of huge estates in Africa, ships coming in from Carthage or somewhere else. Many sanctioned the morality of seeing the biter bit. On the other hand, any one unwilling to have the slur of fortune-hunting cast on him, had almost to avoid the childless rich, and, at any rate, says Pliny, must not offer them gifts.

Writers of every epoch portray the frightful extent of this industry, incredible but for reiteration. Only in one passage is childlessness deplored, in a congratulatory poem of Statius to Vibius Maximus the knight on the birth of a son: 'childlessness, assailed by hostile heirs' avarice, and buried unmourned'. But the numerous pictures of happy barrenness are all tainted with rhetorical exaggeration, then often merely habitual. 'In this city', Petronius (under Nero), transferring the habits of Rome to Croton, writes 'neither science nor oratory is practised, nor can honesty or purity flourish, but all men whatsoever belong to one of two sets, the anglers and the angled. In this city, no one acknowledges children; a man who has heirs is ostracized, and leads a shamed and lonely life. But bachelors without kin are honoured and deemed model men. It is a city, like a field during a plague: corpses and carrion-birds'. The story breaks off at the point when a will is read out, in which the legacies are made conditional on the legatees' publicly carving the testator's body up. And that this condition was not impossible is shown by a fragment of a speech, for, if one close one's eyes, it is easy to see, not the human flesh, but ten millions. And beleaguered men often ate human flesh, without this incentive. That Petronius was only caricaturing facts, is shown by the contemporary complaints before the Senate (A.D. 63) at fictive adoptions by which the childless

secured the rights of fathers: 'for the childless already gained enough by their freedom from cares and burdens, and their popularity'. Seneca even, who often attacked this legacy-hunting (and was often accused of it), could write to a mother who had just lost a promising son: 'One consolation bold but true you have in the fact that with us that childlessness gives more power than it takes away, and solitude confers on old age, whilst depriving it of its support, an influence which will make many simulate hostility to their sons, and even abjure or disown them'. Pliny the Elder says that fortune-hunting was the most profitable occupation, and that a childless condition was a great honour. Tacitus says that it was equally influential in times good and evil, and held up Germany, where this view did not obtain, as an example of uncorrupted morals. Pliny the Younger testifies to one of his friends' great civic virtue in having many sons and being a grandfather even, 'when most deem one single son a burden'. Plutarch witnesses to the same advantages of barrenness. Juvenal, in one of his satires written under Hadrian, expresses lively joy at the rescue of a friend from the sea, and orders a thank-offering: this might, he says, seem suspicious, were the man not the father of three sons, and unlikely to be offered a sick hen or a quail. Under Marcus Aurelius, too, this profession was one of Rome's most obvious perversities. Under Severus, Tertullian describes 'one of the kinds of patience the Devil taught the heathen (in competition with Christian endurance), as that which in snaring the childless endures with pretended affection the labour of a forced complaisance'.

This long list shows how the practice impressed all contemporaries in all epochs, and characterized and illuminated existent social conditions, ceremonies and their object.

Modern Italian custom is paralleled by the ancient habit of meeting in public places, for amusement or business even, in the 'stations', public squares and walks, baths, temples, libraries, book-shops, or barbers' and apothecaries' shops; only in ancient Rome this fashion prevailed much more, in consequence of the mode of life and the multitude and splendour of the public buildings, which were open to one and all. In the later hours of the day, after business was over, men went for walks, into the public paths, lined with

box-trees or laurels and planes, or in the richly carpeted colonnades of statues and paintings. By inscriptions the length of the walk might be estimated. On the green sward of the Campus Martius, all Rome practised gymnastics, ran, rode, played at ball, drilled and wrestled, swam in the yellow Tiber; and success was rewarded with cheers. Just before the dinner-hour the daily bath assembled thousands in the lofty and gorgeous *thermae*. The public spectacles were also social occasions, where select groups of acquaintances met at special places in circles (*circuli*). Martial mentions a poets' resort (*schola poetarum*) and the colonnade in the Temple of Quirinus where his poems were read out, when the listeners were weary of chatter and the Circus. A more leisured company could not be found even in the colonnade of Pompey, of Europa or the Argonauts. In these circles novelties of the day or of literature were discussed. If Caesius Sabinus liked Martial's poems, the poet felt no fear, for 'feasts and *fora*, temples and public places and taverns would soon resound with them, and a copy sent to one man would be universally advertised'. Ulpian, the great jurist, according to Athenaeus, got a nickname which almost replaced his own from the learned questions he volleyed forth anywhere in the streets or shops. If he could live his own life, says Martial, he would choose the Campus Martius, with its colonnades and shady parks as his home, and his baths in the cool *Aqua Virgo* (the conduit, which now feeds Fontana Trevi), and as his occupation, talk and read in the *thermae* and walks.

The only social gatherings of invited guests were the banquets; no others are mentioned, and these banquets took up all of the free afternoon and night. At banquets, entertainments and pleasures as diverse as possible (though varying according to the culture of the host) were given to the guests. Vulgar delights, such as rich freedmen mostly gave best, the clumsy stupid jokes, which made their banquets the mockery of the more refined, have been painted without overcolouring by Petronius, though he transplants his scene from Rome. For guests of taste and breeding Plutarch specifies the best means: the dialogue takes place at Chaeroneia, but is dedicated to the Consular Sossius Senecio, and represents Roman or Roman-Greek customs.

Plutarch also mentions a few unusual entertainments: such as actions of Platonic dialogues, instantaneous artists or moulders of little figures as presents for the *Saturnalia*. In cultivated Society, too, there were various forms of entertainment. At carousals gay Andalusian girls used to dance to the tune of castagnettes and flutes, and accompanied by doubtful songs: clowns and fools indulged in obscenities; children from Alexandria, and trained at Rome, amused the guests with their impertinences; mimes acted in parts that would dishonour the slaves of the honourable. Where decency was more regarded, pantomimes danced, scenes from tragedies and comedies, especially of the newer school, were acted. Plutarch says that there was no need to join in the applause at a banquet if the citharist sang badly, or an expensive actor murdered his Menander. The most usual entertainment consisted in recitals, literary and musical solos and chorus-singing, lyre and flute-playing, often *ad nauseam*: the best party, says Martial, is one without loud music. But the most modest banquets would have their music or declamation; recitals from Virgil or Homer were common. There existed professional declaimers and anecdote-tellers. One Tiberius Claudius Tiberinus, an imperial freedman, in his inscription (which he composed) mentions that his jests made the life of long-drawn banquets, and that he was an expert reciter of the epic poets, and performed publicly in the Forum of Augustus. That the dramatic recitation of scenes from Homer by so-called Homerists in Homer's verses often took place at feasts, is fairly certain. Often the host recited his own compositions.

After the meal, gambling usually followed: the habit often amounted to a dangerous vice, (according to Juvenal) in Trajan's reign, especially in the ranks of the aristocracy, against which he aimed his barbs. There, in front of the statues of the august sires, the descendants gambled all night long and went to bed, when their father's trumpets sounded the *réveille*. Battles were formally waged, the weapons being dealt out by the croupiers; enormous fortunes were won and lost; 100,000 sesterces disappeared, whilst new tunics for the freezing slaves were forgotten. Many, says Galen, devoted as much zeal to dice, as earnest men to science, and showed Stoic endurance in this pleasure-

seeking. St. Ambrose paints the *aleatorum conventicula*, and the applause and laments as men lost or won whole estates. There was a special code of honour in these circles, unflinching obedience: a judgment of the *aleonum consilium* was more feared than a judicial sentence. Suetonius records a letter to Julia, the daughter of Augustus, enclosing 250 denarii: Augustus was an ardent lover of dice and played, not only on the *Saturnalia*, but on other feast days and ordinary days as well: he says he had given each guest so much, in order to play at Odds or Evens. Claudius, too, adored dice, and wrote a book on them.

The conversation at banquets and in society was no matter of indifference to the Emperors, for it was here that public opinion shaped itself. 'I know very well', says Tiberius in a speech to the Senate in 22 A.D., 'that complaints are raised at banquets and in society at the prevalence of luxury, and measures of restriction are being clamoured for'. Society had more importance in many respects in ancient than in modern Europe, as the only vent for publicity, and largely replacing our written and printed divulgation of news. 'There is in Rome', Count Champagny (1804-1882) writes, 'a sort of publicity, unknown to our Northern sedentary habits; which loses power with greater distance, filters but slowly through the provinces, but operates very speedily in the City. Perhaps Rome was every minute better informed of its own doings and thinkings than Paris of to-day. The journals of conversation were not subject to stamps or censors, or police or arrest'. Rome had a written paper; but it was a government organ: the *acta diurna* published what the Emperor thought fit, and no more; disguising fact and abridging reports: Court news, family events in the highest circles, and City reports were also included. Public opinion, as in modern Rome, occasionally found expression in placards on the statues or the walls: or in quick apprehension of the bold insinuations of actors on the stage: or in popular demonstrations at the Circus, where greater licence prevailed. But these scanty inklings roused desire and could not satiate; and forcible suppression in the one spot, whither the news of the whole world flowed in, and where the fate of the world was decided, could only augment guesses, and rumours and surmises and fiction in this 'talkative and interpreting city';

could only foster curiosity and conjecture. Tacitus, even, thought city rumours worthy of inclusion in history. Thus, in 54 A.D., he mentions that, on the eve of a Parthian War, the inexperience and instability of the seventeen-year-old Nero filled some with anxiety, whilst others trusted to his counsellors, Burrus and Seneca: or again, in 70 A.D., that reports of the revolt of the German legions under Galba became more and more frequent, and, in consequence of the popular acceptance of all melancholy news, the Senate despatched an Embassy northwards. In the same year Vitellius entered on his pontificate on the 18th July, the anniversary of the defeats on the Cremera and the Allia, an evil omen to the 'all-interpreting city'. Vitellius' prohibition of conversation on the war only increased it, and spread more disquieting rumours: publicity would have allayed and shown forth the facts. Martial has depicted the professional newsmaker, who knows what King Pacorus is doing in the Palace of the Arsacidæ, knows to the last man the exact strength of the forces on the Rhine and the Danube, can tell the contents of the unsealed despatch from Dacia, and sees the laurel before it has arrived. He knows how often rain has fallen in Upper Egypt, how many ships have sailed from Africa, and the next laureate on the Capitol. 'Spare thy craft', the poem closes, 'and dine with me to-day: on the condition thou tell no news'. Women, too, there were, who knew everything that was going on: caught the last rumours at the City gates, or set them in circulation; were the first to see (November, 115) the comet adverse to the King of Parthia, and could detail all the floods and earthquakes in the farthest East.

Conversation on these topics was allowed: but the absolutism of Rome prevented any mention, save the most cautious and distant, that even touched on home or foreign politics. In one poem of Martial's, six friends are asked to a frugal meal at which any freedom, regrettable next day, was to be avoided: 'my guests may talk of the Blues and the Greens in the Circus, and my cups are not to bring any one to the defendant's dock'. This poem is included in a book published under Trajan, to show that the best government is still despotic: 'freedom of thought and word' was never realized in imperial Rome. This enables us to gauge the

frightful oppressions in the imperial Terrors, when not only the confidential phrase, uttered without malice in the exhilaration of wine, might testify against the speaker, but the destined victims were surrounded with spies, and their every look or sigh or murmur noted down, their thoughts filched from them, so as to punish their guiltless trustfulness with death. Eavesdroppers then made converse almost impossible: 'memory even', says Tacitus, 'would have been lost with speech, could we have silenced our mind as well as our tongues'. In his picture of the trials for high treason, which connect the facts of this period, Tacitus only condescended to brand the higher and more obvious *delatores*, who, by their shameless profession, aimed at pre-eminence: the baleful secret spies and eavesdroppers he passes over with contempt.

Only scattered indications of the scheme of the secret police have come down. Perhaps, as in other imperial institutions, the Persian monarchy provided the model. According to Dio, Maecenas advised Augustus he should have throughout the whole Empire spies to report what should be averted or prevented, but should be cautious in his credence of them. Dio ascribes the same warning to Livia; for spies often denounce the innocent from spite or for bribes, or being disappointed of their blackmail; and often not for overt acts or intentions, but mere words, mere silences, or expressions of feeling. Claudius instructed his spies to inform him accurately as to family circumstances (presumably amongst the knights and senators): they had been remiss. For people, informed against as being childless, unmarried or poor, frequently proved the contrary. One man accused of an attempted suicide, stripped and showed he was unwounded. Nero utilized the brothels and their inmates, to discover who were the visitors: Pliny, in his bombastic manner, says that the result was barbarous, and the City filled with the ghosts of the victims. Soldiers in civil dress as secret police are first mentioned under Otho (69 A.D.); they frequented the houses of the noble and the rich and spread a general panic. 'Precipitate confidence', says Epictetus, 'gives the incautious over to the soldiers. A soldier in civil dress sits by you, and begins to abuse the Emperor: his simplicity allures you to equal frankness,

and chains and prison follow'. Hadrian organized a special corps, the *frumentarii*, as police and then as spies, and maintained a surveillance in his friends' houses. In his reign, this vicious system reached a fearful height. Aristides, in his eulogy on his successor, says that the entire Empire had been oppressed with servile fear; everywhere spies were on the alert; no one dared utter his thoughts; freedom, intellect, and justice were dumb; every one feared his shadow: but the reigning Emperor had banished this horror and restored freedom in full and ample measure. It was in the capital that spies abounded most. Tigellinus caused Apollonius of Tyana to be watched with the Argus eyes of Empire, standing or sitting, silent or speaking, or eating; and noted with whom he ate, and when he made sacrifice. Apollonius himself calls Rome a city all eyes and ears: no reform of state might be dreamed of, unless by a man yearning for death: even in things licit the wise were not too free. Lucian, in his satire on a self-made man, who wished to recommend himself to Marcus Aurelius by the purchase of a library, says he was deceiving himself: the Emperor had many eyes and ears. The upper classes were the most surveyed. Caracalla made the soldiers thus employed answerable to himself alone; only he had jurisdiction over them: they informed him very thoroughly and tyrannized over the senators. The biographer of Alexander Severus says that he appointed competent secret spies, for the hope of the spoils depraved society. In the fourth century, Diocletian reorganized the secret police over the entire Empire: they, intent only on their own ends, persecuted the innocent, and concealed crimes, such as false coining. The comparison Libanius makes of these informers to dogs who have an understanding with the wolves, and the many and passionate complaints of the writers of the day apply equally to the first century. The evil was true to its vile nature, and new only as ramified.

The power of these spies in the milder reigns, as under the Antonines, may have been less: but never, in imperial Rome, was political conversation, in assemblies or public places, permitted. Dread of the lurking informers made caution in conversation essential: Tacitus calls Rome a city in which all is learnt and nothing hushed up. The spread of dangerous secrets was not always evilly intended; impor-

tunity, curiosity, incaution caused a great deal of harm. Seneca attributes this to the many busy idlers of Rome. 'Hence', he says, 'this frightful vice of spying on affairs public and private, and the knowledge of things, neither to be heard nor told with safety'. Seneca's reticent words are noticeable: he never refers to the subject elsewhere. The huge numbers of the clients and domestics of the great houses furthered this gossip; clients and, still more, slaves were said to be chatterers. To blurt out a secret of their master was a greater delight than to steal and drink his Falernian; there was no crime they would not attribute to them, out of spite at some punishment. 'Even though his slaves keep silence', says Juvenal, 'his horses and dogs and lintels and walls will speak: closed windows, stuffed-up chinks, extinguished lights, solitary sleep,—nothing will prevent the nearest publican from knowing what he did at cock-crow'. Martial says one coachman received 20,000 sesterces, for being deaf.

Hence, knowledge of personal doings quickly spread abroad and furnished new matter for gossip. Besides informers, scandal-mongers were active. Cicero even said that in 'a city so full of evil talk' hardly any one could escape calumny; the experience of St. Jerome five hundred years later, who says that each absent guest in turn had his character and habits pulled to pieces. Especially relations between the two sexes were thus treated. Propertius called this the fee women pay for beauty: he and other poets of his day complain at this persistent gossip. Statius, in his poem on the marriage of Stella and Violentilla, says that Rome can at last see the embrace she has been talking about. In this branch the women were especially happy. And, beyond these topics, all these busybodies knew the secret faults of every man; what one man paid for his mistress, and how another man feasted till daybreak, that Titus owed Lupus 700,000; and the luxurious loved having their luxury common talk. Any intestate death of a rich man, or great banquet of a poor man, provided the banquets and *thermae* and theatres and stations with endless matter. Pliny the Younger tells a friend of the death and will of Domitius Tullus, who had outwitted expectation by thinking of his relatives rather than the leeches who were awaiting his decease, and gives

the various opinions held, how some admired his evading his expectant flatterers after all. He concludes: 'This is all that Rome is talking about'. Or new palaces and villas might be the topic, a new tragedy with bold passages, or a celebrated pantomime's last dance, and, above all, the Circus. The Emperors made every effort to divert the people, and the greater the preparations, the greater the success. Passion for the stage, the arena and the Circus was an endemic at Rome, affecting the upper classes as well: gladiators and racehorses (according to an author about 100 A.D.) left Rome no time to think of culture. Remarks on the Circus and the weather (the usual method of beginning) were the stopgaps of the cultivated even. Epictetus recommends little conversation, and no small talk on gladiators, chariot-races, athletes, food and drink, and, least of all, on persons. These were the fop's interests; some of them are touched upon in Martial's description of the dandies of his day. 'You are a good fellow, Cotilus. So they all say. But what is a good fellow? One who has his hair nicely curled, and smells of balsam and cinnamon; who can hum the tunes of Alexandrian and Spanish dances, and sits all day long between the ladies, whispering, writing and reading *billets doux*; who also hates being jogged by his neighbour, and knows also every one's lady-love; one who runs from one party to another, and knows the pedigree of the best racehorse by heart. Is this right, Cotilus? Then it is no easy matter to be a good fellow.'

The principal duty of a host was to see to the guests having pleasant topics of current interest to talk about. Plutarch has enlarged on this art of leading conversation, as the main constituent of social intercourse. He gives examples of proper questions, where an office has been successfully held, an audience had of the Emperor, or the sons of a man have been progressing well, or in unpleasant things, on the defeats of a guest's personal foes. He thought that explorers suffered most from the megalomania of retailing their own experiences; Epictetus cites the boring iterations of an old campaigner in Moesia: 'as I said, I was climbing the escarpment, when . . .' Sportsmen loved questions as to their hounds, athletes on athletics, religious men on the success obtained through dreams or sacrifices by the grace

of God, and the aged were indulged in the liberty of narrating any reminiscence they would.

The art of conducting a lively intellectual banquet was amongst Greeks and Romans in high repute, and important writers tried to inculcate the methods of it. The gorgeous banquets of the rich were held in halls of thirty tables and three hundred guests, where one man might be alone, not knowing any one there : Varro advises the numbers should only scale up from that of the Graces to that of the Muses, and should be chosen with a view to general sociability. Small parties of witty and educated men made confidential conversation thoroughly a delight and a restorative. Cicero said that the Latin *convivium* was an apter word than the Greek *συμπόσιον*, as eating and drinking did not comprise life in common. The pleasure of such a party concealed the immanent self-culture.

But Romans were rather incapable of a heartfelt friendship ; Fronto says, in all his life at Rome he never enjoyed this *φιλοστοργία* which he could not translate into Latin, and his imperial pupil Marcus Aurelius includes among the truths learnt from him, that distinguished men were cold-hearted (*ἀστοργότεροι*). But just as Italians of to-day, with all their reserve, are charming, amiability in Rome was common. At banquets especially the southerner displayed his gifts—ready speech and wit, the true Roman salt, specifically ascribed to Rome as ‘urbanity’. Cicero thought the old Roman wit was saltier than the Attic ; its rarity in its genuine form made it the more valuable, as the old Roman grace was almost merged in a flood of Latin, foreign, and even trousered Transalpine elements.

A born entertainer was eagerly sought after in every portico and theatre. True, conversation was often interrupted by a plethora of recitations, music or theatricals, and the banquetting hall tended to become a stage or lecture-room ; and Pliny the Younger says the bored guests were not at fault in leaving early or lounging in wearied attitudes. But, in apt measure, entertainments could direct the conversation ; thus recitations from poets bring about aesthetic appreciations, such as women adored. The custom of varying banquets with intellectual sweetmeats must not be condemned by its exaggeration. It rather indicates how this epoch under-

R.L.M.

Q

stood the refining of its pleasures. These cultured extras of intellect to a feast were almost universal : even the Trimalchios had them. The pleasant dessert for a society of education and good taste was talks on science, art and literature ; even the rude, says Plutarch, felt and satisfied this want by propounding and solving riddles. Plutarch's conversations, partly at the board of the Consular Sossius Senecio at Rome, partly in his Greek circles, cover a very wide field ; some dealing with the banquet, whether the host should assign his guests their places, or leave them free to select, whether the so-called consular place is the highest ; whether the sea or the land give better food ; whether simple food or made-up dishes are better. Or in philosophic circles, acuteness was tested by such questions as, why A was the first letter ; or which came first, the hen or the egg. Or they might be scientific : why the aged are long-sighted, why snow is kept under blankets and chaff ; whether new diseases can arise and how. Or literary problems might be discussed : why Homer calls salt divine, and only the liquid oil liquid : which hand of Venus was wounded by Diomedes. Or in aesthetics : why anger and sorrow on the stage afford pleasure, and in life even the news of them pain ; how to avoid the degrading effect of ignoble music. Or notable facts might be handled : the birthdays of great men, or Pythagoras' prohibition of eating fish ; whether Jews forbade eating swine out of respect or disgust ; who was the god of the Jews ; why the days named after the planets were in reverse order ; the effect of the evil eye. Learned men might not withstand the temptation of giving an over-exhaustive dissertation on their subject. Lucilius, a Greek poet under Nero, complains of the philologists of the dinner-table, and begs his host not to immolate him to the pedants and word-sticklers of the craft of Aristarchus ; could he be excused to-day from hearing *μήνιν ἀειδε θεά* ? Philosophers, too, would, with their severely abstract speculations, torture their fellow-guests, who could not follow them, and relieved themselves with songs, and anecdotes, and things common and trivial. Varro had deprecated such table-manners. Some people, too, wanted to appropriate some impressive philosophic snack for exhibition at the Emperor's table, and studied philosophy and attended lectures, so as to impose

on senators who might be their neighbours ; or they would dazzle the guests with a catalogue of monograph-writers on a particular form of syllogism.

Such habits may then have been laughed at, but must have been more usual than they are now. For, in ancient society, culture and intellectual advancement were far more than now the objects of personal intercourse ; 'in living exchanges of ideas and gay companionship', and thus the many banquets of learning and philosophy were a kind of academic session. But the consideration of them is not in place here, where only the nature of cultured society has to be considered.

CHAPTER V

THE POSITION OF WOMEN

ALL these dissertations have necessarily been fragmentary, as the sources of information are only occasional: of the life of women also, and then only of those of the upper classes, very little is known.

Roman maidenhood did not last long; as soon as puberty was reached, betrothal and marriage followed. Identical with modern times were the anxious care of mothers, relatives and nurses, the words of endearment (such as birdie, little dove, little crow, little mother, little lady) and the lisping childish language and the lullabies ('sleep, my child, or suck'), rattles and other means of soothing (such as beating the stone that had hit the child), and the many superstitions, at all ages: such as binding on teeth of horses and boars to alleviate the teething, and old wives' simples and amulets against the evil eye. As a preservative against the *strigas*, or vampires, garlic was wrapt up in the swaddling-clothes and hawthorn planted in the windows. A mother, who was passing a temple of Venus, would mumble a prayer for her daughter's beauty and make a vow. The figure of the girls was made artificially perfect. They wore tight stays from early childhood, so as to raise the hips into relief, and nurses' carelessness often produced rounded backs or unequal shoulders. This practice could not have been confined to Pergamus, where Galen observed it most. Terence, in a passage pointing at Roman customs, blames the mothers who made girls weak, with low shoulders and narrow breasts. Any one not thus crippled the matrons call a pugilist, and starve her: thus even the finest natural figures are all as like as peas.

Many mothers gave the whole care of their children to

nurses, slaves and often barbarians. Wet-nursing was the general rule in Greece and Italy, however deplored by philosophers, such as Favorinus and Plutarch; Plutarch's wife certainly did not give suck to her own daughter (who died in infancy). Physicians wrote, giving full directions as to the selection of a nurse: her milk ought to be tested by three senses. And Soranus of Ephesus, a physician in Rome under Trajan and Hadrian, advises the employment of Greeks, so that children may learn the most beautiful of languages, and receive the utmost attention, lack of which so often caused bow-leggedness.

Little girls had, as toys, flowers, coloured stones, shells, amber, balls and nuts (with which in modern Italy many games are still played), and are thus often represented by artists: and dolls, of ivory and terracotta, with movable limbs; examples have been found in the tombs. Plutarch, in a letter to his wife on the death of their daughter Timoxena (she had already lost four sons), mentions an instance of her sweetness, that she used to bring her toys to her nurse to give suck to.

When sated of play, little girls would sit at their nurses' feet, and listen to fairy-tales. Roman fairy-tales began like ours: 'There was, once upon a day, a king and queen . . .' and led the child's mind into the same bright realm of wonder. Roman princesses, too, were 'too beautiful for words': the fairest of three sisters was envied and pursued by intrigue; and, in the end, she too married the fairest prince, whilst the two ugly sisters were consigned to a shameful death. We, too, know the suspense on the child's face, when the princess must perform the three labours, and the sigh of relief at their accomplishment by supernatural aid. When, at the evil mistress's behest, she had to pick out the millet from a huge heap of grain from morning to evening, the ants came and did the work for her. The reeds whispered to her how to pull out tufts from the wool of the wild golden-fleeced sheep, and the eagle fetched her the miraculous water from the dragon's well.

Next came the years of lessons. They were taught womanly work. Embroidery, as a general rule, was a man's occupation. Varro only requires girls to be taught painting, so as to be able to judge carpets and curtains. Spinning and

weaving was the principal subject: for, in old-fashioned houses, clothes were still home-made. Even Augustus' daughters and granddaughters spun and wove, and he wore the work of the hands of his wife and sisters. Quintus Lucretius Vespillo (consul 19 B.C.) in the inscription on the tombstone of his wife Turia praises her above other women for her especial virtues as a spinner. Naturally this obtained less in the aristocracy, and more in the lower and middle classes; even the Cynthia of Propertius, and the Delia of Tibullus, who were not matrons, spun and wove. Tibullus consoles himself, on parting, by imagining the next meeting, how Delia, late at night, by lamplight, will be listening to the tales of an old nurse; how all the maids will have fallen asleep, but she, at the sound of his step, will spring up, with bare feet and loose hair. Columella's grievance that most women were too luxurious and idle to look to the spinning and weaving of the home, shows that the custom was obligatory, though already in decay. Musonius Rufus and Tertullian both specify this duty of women. Inscriptions, belauding women as good spinners, or depicting a loom as their emblem, prove the continuance of this custom, and very late evidence of it is found. Ausonius in his poems on his mother and his nephew's wife did not pass over their 'busy spindle': Symmachus thanks his daughter for a dress sent from Baiae, a fine example of her homely work and her affection.

Daughters in the higher ranks received learned instruction at home; only the smaller people sent their girls every morning to early school, to be disciplined by the master, 'so hated both of boys and girls'; and both sexes were (perhaps up to a certain age only) instructed together. Martial asks: 'is it a poet's ambition to be read out by a hoarse and pompous schoolmaster to an unsympathetic crowd of boys and girls?' The tomb of a schoolmaster at Capua depicts an elderly man on a high seat, on his right a boy, on his left a girl. According to Paul of Aegina, reading and writing should be taught in mixed classes at the age of six or seven. The higher instruction of girls is seldom mentioned, but seems to have been the same as the boys', reading and explaining poets in both languages. Boys and girls, says Ovid, read Menander, though he is nothing but love-stories. Martial

mentions epics and tragedies as poems read in such schools : Claudianus praises Honorius' bride Maria for going on with Greek poets (such as Homer and Sappho) and Roman poets under her mother's guidance. A late Christian poet says that Christian teachers are at fault for letting Virgil, Horace and Terence be read instead of St. Paul and Solomon. Quintus Caecilius Epirota, a freedman of Atticus, and a known and learned man, taught his patron's daughter after her marriage with Marcus Agrippa ; he was suspected of an intrigue and dismissed. The pupil in this case was already married : thus the danger involved in private tuition of boys (according to Quintilian) must have been as great in the case of girls.

Music and dancing formed an important part of girls' education. Catilina's friend Sempronia, who knew the two literatures well, 'danced and sang better than an honest woman should'.¹ Famous musicians, such as Demetrius and Tigellius, in the time of Horace, spent a great part of the day by the easy chairs of their pupils. In an elegy on his fascination by feminine charms, Ovid calls a well-trained voice irresistible, as also an adept lyre-player, or the graceful movements of a dancer. Hostia, the lady of Propertius, was skilled in both arts. Statius praises his stepdaughter as well-trained : she, he tells his wife, will soon find a man, and her excellences deserve it, her playing on the lute, her improvisations of native songs, or her white arms swaying to the dance. But her talent was nothing in comparison with her taste and virtue. On inscriptions the cither sometimes typifies the maid, and the scroll the youth ; the continuance in heathendom of music as the principal female education is vouched for by St. Jerome, who says Christian maidens should have no ear for organ, flute, lyre, or cither. The art of dancing consisted in rhythmical movements of the upper part of the body and the arms ; and then, as now, no little of the grace of the women of Rome was attributable to the national dances. A good carriage was a woman's especial charm, as Ovid testifies, and, as a Republican inscription runs : 'Her speech was fair, and her gait noble'. Of the stringed instruments played by girls, and of some Greek dances, some were condemned as sickly and exciting. Girls used to exhibit their powers of singing. On days of fasting

¹ Sallust.

or festival, choruses of thrice nine noble maidens used to sing in the procession ; many a lady, Horace hoped, would remember learning and singing his *carmen saeculare*. At the funeral of Augustus boys and girls of the highest families sang the dirge. At the apotheoses of emperors a chorus of noble boys and women sang encomia, set to mournful and solemn themes, by the hearse in the Forum. In addition, facility in improvising to the lute songs to poetry was common amongst girls and women, as in the case of Statius' step-daughter and Pliny the Younger's wife.

Thus occupied, thus supervised by nurses and pedagogues, the child became a maiden. Pliny the Younger portrays a pleasant, well-educated girl of a great house in his laudation of the daughter of Gaius Minucius Fundanus (consul 107 or 108), who died shortly before her marriage. 'She was not in all fourteen years old, and had the sagacity and dignity of a woman, with maidenly charm and virginal purity. She used to cling to her father's neck ; lovingly and simply embrace his friends ; love her nurses, pedagogues and teachers, each after his right. She was zealous and intelligent in her studies. She played rarely well. What patience and strength she showed in her last illness.' Twenty years ago, the marble cinerary urn of a young bride was discovered behind Villa Mellini on Monte Mario. She is inscribed as being twelve years, eleven months and seven days old. Pliny puts his date too high.

At an early age, parents sought to assure a daughter a happy and suitable marriage. The lowest age was at the beginning of the thirteenth year ; the inscription on the grave of a twelve-year-old child says that she was just ripe for marriage. Often they were introduced to their bridegroom even earlier, but attained the rights of wives only at the end of their twelfth year. A rescript of Severus prevented them from being accused as wives (though they could as *fiancées*) for a previous adultery. Between the ages of thirteen and sixteen they were usually married. Rufus, a physician under Trajan, followed Hesiod in considering the normal age eighteen, but said it was too late in modern days. A woman who was twenty years old, and had not been a mother, became liable to Augustus' provisions against celibacy and childlessness ; nineteen full years were the

utmost. The will of the parents was absolute, as it must have been, in view of the *patria potestas* and the inexperience of the young girl. The girl's consent was necessary, but assumed, unless she refused it; which she might do only if the father chose a notoriously disgraceful or unsuitable bridegroom.

Generally marriages were matters of family convenience. A letter of Pliny the Younger indicates the considerations that governed the greater houses in selecting a bridegroom. Junius Mauricus, his friend, had begged him to find a husband for the daughter of his brother Arulenus Rusticus. Pliny suggests a younger acquaintance of his, Minucius Acilianus, who was over thirty, as he had been praetor. Acilianus was born at Brixia in Northern Italy, a conservative district. His father had been prominent among the knights, his grandmother had been a sternly moral woman, and his uncle an excellent character. Mauricus could find no fault with the family. Acilianus himself was a very energetic person, and very modest, of noble countenance, good complexion, handsome, and of senatorial rank. 'Such a man must not be despised; such are the prizes for virtuous maidens. Perhaps, I ought to add, the father is very rich. Perhaps not, considering you and the proposed bride; but yet our modern habits, private and public, are based on wealth, and it should be mentioned. And, of course, if one think of the children, and of a large number, the husband must be in a position to provide for them.' It scarcely needs actual proof that money often determined the selection of the husband. Amongst the boons procurable for cash, Horace counts a richly dowered wife: Juvenal asks, was ever a son-in-law acceptable, if poorer than his bride? Both sides certainly took account of rank and lineage. Agricola married a daughter from the equestrian nobility, and thus gained influence and support.

Generally, men married before Pliny's ideal age. Augustus penalized childlessness for males at the age of twenty-five. Ummidius Quadratus might have become a father at the age of twenty-four; Agricola was one at the age of twenty-three; when Tacitus married his thirteen-year-old daughter, he was scarcely twenty-four, whilst Lucan was twenty-five, when he married Polla Argentaria; Ovid was a 'mere boy' at his first marriage. In Apuleius' romance, a bride is only

three years younger than her husband, to whom she had been engaged from childhood, and grown up with. The few facts extant make marriages of men in the middle and lower classes under eighteen or twenty, exceptions; this accords with Augustus' law. Nowise authorized is any idea of a custom of marrying off half-grown boys. In the senatorial ranks, the holding of the quaestorship (the first step), generally reached at the age of twenty-five, may have been a preliminary condition. Helvidius Priscus was made Paetus Thrasea's son-in-law as a quaestorian. Junius Avitus, who died as aedile designate, had been married one year, and had just had a child.

Often daughters were betrothed in their childhood: these betrothals being negotiated by intermediaries; there is no Latin corresponding to the words 'woo' and 'court'. Marriage-brokers at Rome seem to have had a regular business and their own offices. The spokesmen or young men applied to the parents or guardians of the girl. The betrothal was solemnly and festively celebrated. Pliny the Elder once saw Lollia Paulina (a former wife of Caligula), at a betrothal festival in a not very prominent family, standing under the lamplight sparkling with emeralds and pearls worth 40,000,000 sesterces (£435,000), as she was only too eager to prove by the bills. At the betrothal the principal question was the dowry. According to Artemidorus' *Dream-book*, dreams of children always mean trouble, for to bring them up is troublesome: to dream of a daughter is worse than to dream of a son: for a daughter means a dowry and is a kind of creditor: 'And the daughter's claim is absolute; however great the labour of rearing her, she leaves you with her dowry, like a dun with the amount of the loan.'

A betrothal, however long, did not affect the relations of the pair. They still did not know each other, unless the bride was given to her husband before reaching puberty. Any animal or slave, says Seneca, or every article of clothes or dish is tested before purchase, but never the bride by her groom. Any vices she may have of passion, stupidity, misshapeness or evil breath are learnt only after marriage. The conception of bride with its hallowed associations was unknown to Greece and Rome. The betrothed, besides other bride-gifts, gave an iron ring without a stone (iron

rings were worn in earlier days as seal rings), and afterwards a gold one as a pledge of faithfulness, but received none in return. When the wedding-day drew near, the *trousseau* and household of the young wife set the house in a bustle. Pliny the Younger sent one Quintilian (not the author), to provide the service and *trousseau*, a present of 50,000 sesterces (£543 1s. 6d.), as he regarded himself as the bride's second father, and Quintilian, though not very rich, was marrying the daughter of a high official; remarking that his contribution was small only in view of Quintilian's reluctance to accept anything larger. Any rich bride must have ornaments and jewelry included in her outfit, generally the gift of the bridegroom. The maiden took leave of her childhood, consecrating her toys and dolls to the patron deities of her younger life; and, at last, came the day on which the mother decked her daughter for the great procession. The principal part of the bridal robes was a square flaming headdress, falling down to her sides and leaving her face exposed.

At dawn the homes of both parties filled with friends, relatives and clients, who also acted as witnesses to the contract. Both homes were festively lit up, especially the *atria*, in which the ancestors' cupboards were opened wide, and decorated with carpets, wreaths and green twigs. The woman leading the bride brought the couple together: they went up to the altar and sacrificed, and offerings were also made in the temples: the streets, through which the bridal procession was to pass, was thronged by the curious, for whom stands might be put up. In ancient days, the bride only entered her husband's house at the rise of the evening-star; but this custom had died out, though torches were always used: bonfires were also lit in the streets. Flutes were heard amid the joyous songs. The bride was lifted over her new threshold, and, in default of a banquet at the bride's home, there would be one, to crown the day, at the bridegroom's, his bride sitting beside him. Augustus endeavoured to restrict the luxury of these feasts; no more than 1,000 sesterces should be spent on the wedding and the after-feast; this sum is too small for the law to have been regarded. The expenses were great, what with the large numbers entertained, the doles to the clients, and the moneys given to the guests in recognition of the honour they

were doing the house. Those desirous of marrying less extravagantly celebrated the rite in the country, and thus, incidentally, escaped the many invitations sent to the young couple. This was how Apuleius and Pudentilla were married at Oea (in Africa); but we may without hesitation assume similar customs in all the provinces and in Rome.

To such young wives marriage must have been a sudden release from surveillance to freedom absolute, and an awakening to an enlarged horizon: for, then as now, girls must have been very much secluded in old-fashioned families. Ovid, it is true, excuses his frivolous poems by saying they are much less bold than the mimes whom ladies and their grown-up daughters go to see; but such can hardly have been in good families. These daughters were almost always, in ancient days, refused access to the dinner-table, to spare their young ears. And, actually, girls left the nursery for the married state, as Pliny's letters to Minucius Fundanus show. From that narrow sphere, they were suddenly transplanted to a dazzling world of splendour, with all its enjoyments and distractions, all of which they might share in for good or for evil.

In their own home, they had great authority. The old Roman paternal family autocracy had broken down at last, and the legalization of women's proprietorship in their dowry was their final emancipation. In the so-called free marriage, usual under the Empire, the husband received only the dowry, and that not absolutely: all the rest of the wife's property she had control of, the husband not having even a usufruct. Probably wives utilized this power to make their husbands knights or senators. Martial praises one Nigrina, who divided her paternal inheritance with her husband Antistius Rusticus (who afterwards died in Cappadocia) for showing more affection than Evadne or Alcestis. This unassailability of the wife's property occasionally became the bankrupt's resource. An insolvent would assign his property to his wife, and so cheat his creditors. Apuleius asserts that the father of his accuser Herennius Rufus made such a conveyance when bankrupt, and, thus sheltered by his dishonour, could leave his son 3,000,000.

The stewards of rich ladies, who had charge of the jewels and gold and wine and favourite slaves, were generally proven

freedmen. Often, too, they had their own *procurators*, if possible, lawyers, who would also be counsellors and confidants. The tomb of one Paulina at Sestinum, in Umbria, is erected by her friend and procurator Petronius Justus. Pudens, a learned freedman of Marcus Lepidus (consul 6 A.D.) was procurator to his daughter Aemilia Lepida, the wife of Drusus, Tiberius' adoptive grandson; in 36 A.D., she committed suicide, to escape conviction for adultery with a slave. Pudens, in his inscription, asserts, that, as long as he lived, he watched over her conduct, and kept her as the consort of the prince. Cicero, in his *Pro Caecina*, jeers at Aebutius, who managed the widow Caesennia's affairs, and made her believe him to be indispensable. His real past was known from his daily life, as a great ladies' man, and protector of widows and litigious defender of them: amongst men a silly fool; amongst women a learned, cunning lawyer. It was more suspicious when the procurators were mere dandies. 'Who is that curly-haired mannikin', asks Martial of a cautious husband, 'who never leaves your wife's side, is always whispering into her ear, and supporting her chair? Her business manager? He looks a reliable and stern procurator. In acuteness he would rival Aufidius Chius [a notorious adulterer and jurist]. And he is her manager. You fool, he is managing your business'. And in the mock-trials of young rhetoricians, the 'pretty procurator' was a frequent exercise—as probably in reality. The following case was given for debate under Augustus. 'A man has a son by his wife. She dies. He marries again and has a second son. There is a pretty procurator in the house. The stepmother and stepson often quarrel, and he turns the latter out, who takes a house next door. Gossip tells of adultery between the procurator and the wife. One day the husband is found in his room murdered, the wife wounded, and the intervening wall broken through. The relatives decide to ask the five-year-old boy, who had slept with his parents, who was the murderer. The child points to the procurator. The son and the procurator accuse each other of the crime'. Seneca describes in his book on marriage the young wife's proper retinue, which includes a curly-haired procurator, or rather, lover. Firmicus Maternus the astrologer repeatedly mentions these procurators of rich

and noble ladies, and St. Jerome cautions his Christian friends against going out with curly-haired procurators.

Hence wives so independent—especially when of noble lineage—often lorded it over home and husband. Horace describes the Scythians as originally not giving the rich wife mastery of the husband. 'Why have I not a rich wife?' asks Martial; 'because I do not wish to be my wife's maid'. He found that the foppishness and overweening ways of spoiled boys were an easier burden than a dowry of a million. And Juvenal thinks nothing more intolerable than a rich wife. To both Greeks and Romans the slipper symbolized the rule of the woman.

Fictitious marriages, too, entered into by poor men for a fee, were not rare, so as to allow the woman to evade the laws against celibacy and enjoy absolute freedom. Seneca mentions this in his book on marriage, and Martial jeers: 'Your Laelia, your wife within the law, is a very law-abiding wife, Quintus'. Tertullian speaks of the patience such mercenary husbands showed to their rivals, and St. Jerome, of poor men, called husbands, and divorced at the slightest demur. On the other hand, senatorial women sometimes lived in concubinage with freedmen whom they might not marry without losing rank, as senators did with freedwomen. Callistus, bishop from 218-222, authorized such alliances amongst the women in his parish. For women in other ranks to marry their freedmen was less common than for slaves to be freed and made the mistresses of the establishment; the former practice was only legalized in the third estate at the beginning of the third century. A freedman, Tiberius Claudius Hermes, who married his five-and-twenty year-old mistress, and for two-and-twenty years lived with her 'happily by her favour', says on the tombstone of his 'patroness and true wife', that he owed her his station and repute for all his life long. But an inscription in Aquileia of a slave freed and married by her master runs: 'I was Anicia Glycera, freedwoman of Publius Anicius. Of my life I have said enough: I secured myself well and won the contentment of a good man'. Augustus' prohibition of slaves married to their patron getting a divorce against his will was re-affirmed by Justinian.

In society, too, women were independent. In Republican

days, too, they had been free, unlike Greek women, whose highest commendation was 'to occupy their husbands' thoughts, as little as might be, either for good or for evil'; whose frontier was the threshold, crossing which meant risking their position. In early Rome, though domestic virtues were valued in the wife, she had never been secluded. Cornelius Nepos, in the preface to his biographies, contrasts Greek and Roman customs: in Rome any wife could properly attend a banquet, or live in the front of the house and be seen, and watch the spectacles. The gradual breaking up of the family, the cessation of the ancient stern morality, accentuated the tendency, and, under Augustus even, wives were socially almost unrestricted.

The rank and standing of a lady and her titles, privileges and distinctions, were as closely gradated as those of men. Generally they shared the husband's station; but sometimes the Emperors would give women consular rank, with the *insignia*, if relatives and not married to consulars, and might, on rare occasions, leave them with this honour if they remarried a man of lower standing; thus Elagabalus acted with regard to his aunt Julia Mamaea when she married Gessius Marcianus, a knight (she became the mother of the future Emperor Alexander). He also raised the mother of his favourite Hierocles, a Carian slave, to consular rank. The privileges of these ladies consular—according to Ulpian, the wives, not the mothers of consulars—were very great: Ulpian is uncertain whether even a man of praefectorial rank had precedence over them.

When a woman entered the senatorial order, the *conventus matronarum* held an assembly. It was an ancient guild of religious origin, and became the Empress's maids of honour. Agrippina, Nero's mother, after the death of her husband Domitius, had so publicly set her cap at Galba, the husband of Lepida, the future Emperor, that she was arraigned by Lepida's mother at a meeting and beaten. All night, says Seneca, a husband must listen to his wife's reproaches: 'She appears in public richly dressed, and is held in honour: at the *conventus* I am a nobody'. There is scarcely anything known as to the constitution and competence of this guild. It had—like similar bodies in other cities, such as the Ladies' *Curia* at Lanuvium, with its double tables on public festivals,

or at Naples, with its temple and priestess—a *curia*, or meeting-place, on the Quirinal, another in Trajan's forum, where inscriptions have been found; 'Empress Sabina to the Ladies: Restored by Julia the mother of Emperors (Caracalla and Geta) and the troops for the ladies'. Elagabalus had a new building erected on the Quirinal, and enlarged the power of the feminine Senate, and had a number of inquiries on points of etiquette set on foot; what costume befitted women of various ranks; which had precedence, and which had the right of the kiss; what kind of carriage and equipage each should have; which ought to have sedan-chairs, either with silver or ivory, which might have golden or jewelled shoes. [Elagabalus' biographer calls these *senatus consulta* ridiculous: Aurelian's biographer says that the latter restored the women their senate, on condition of priestesses having pre-eminence in it, and perhaps the permission given to women to wear red, yellow, white or green shoes, is referable to such a *senatus consultum*. Under Augustus a special dress of honour was allowed to mothers of three children, a special form of the *stola* to all blameless women; and, when the *stola* in the first century went out of use, it lingered on in the title of *stolata femina*, not only granted to mothers, but honorarily as well.

Girls of the higher ranks left the silence and dependence of the home for the full freedom of married life. There they were exposed to every breeze of public influence. The young wife was greeted, even by her husband, with the honourable name of *domina*, equivalent to *donna* or *madame*. At their back, hundreds of hands had to serve. In the microcosm of a great house, with its scattered properties, legions of slaves, and retinues of clients and subjects, her will granted or withheld fortune or even life. Youths and grey-haired men, the learned and the brave, the veterans and noblemen, all sought her favour. Whatever claims to admiration she might have, beauty, wit, talent or education, her position ensured her success. In her new sphere, vanity and urbanity and intrigue were thoroughly at home, passion and flirtation had full play, and temptation was there strong enough to overthrow the strongest. 'Anything assailed by countless desires is insecure', says Seneca; 'one brings his beauty, another his wit, a third his intellect or generosity

to the attack, and a fortress attacked on all sides must give way'. And feminine ambition had a wide field. Very many noble women had, later on, married an emperor.

To estimate the moral condition of women there is no lack of illustrative facts or general criticisms in the successive epochs. Towards the end, pessimism has full sway; but the writers generalize and exaggerate too much. The complaint of female immorality at Rome was of ancient date: 154 B.C., in the censorship of Marcus Messalla and Gaius Cassius, according to Lucius Piso Frugi (consul in 133), Roman modesty was dead. At the time of the last Civil Wars, which caused an utter disruption of moral relations, Velleius testifies irrefutably to the honour of Roman women; he says the sons of the proscribed in the second Triumvirate were faithless, their freedmen somewhat better, but their wives models. Hence the rather incongruous reports of the next generation can be taken with a grain of salt. In 18 B.C. Augustus was legislating against celibacy, and the Senate declaimed against the looseness of morals, and was reinforced by Horace's pathos and Propertius' melancholy and Ovid's impudent jeers. 'Ages rich in sin', says Horace in one of his solemn odes, 'were the first to taint marriage, and family. From this source the evil has overflowed'. 'Sooner', says Propertius, 'will the sea be dried up, and the stars reft from Heaven, than our women reformed. In the East, women are loyal, and widows vie for the funeral-pyre of their husbands. Here wives are faithless, and we have no Evadne or Penelopes'. 'Pure', says Ovid, 'are only those women who are unsolicited, and a man who is angry at his wife's amours is a mere rustic'. Similar dependencies are reiterated in the succeeding ages, and State regulations were devised to curb the increasing vice. In 19 A.D. a Praetorian woman Vistilia registered herself at the aedile's as a prostitute. She was banished to a rocky island in the Archipelago, and a *senatus consultum* was passed, prohibiting the prostitution of women, whose grandfather, father or husband had been a knight, and making women guilty of immorality indictable by the relatives as of old, if a public prosecutor were lacking. Seneca the Elder held that the corruption had proceeded so far that no credulity could be too great in tales of adultery. Seneca the Younger exalts

R.L.M.

R

his mother for having exceptionally kept conjugal faith. Any one, he says elsewhere, whose amours have not become notorious, and who does not pay a married woman a yearly fee, is despised by women as a mere lover of girls; in fact, husbands are got as mere decoys for lovers. Only the ugly were loyal. A woman content to have only two hangers-on is a paragon. Ladies' days are divided up between their various lovers, and are still not long enough. A relation with a single lover, they call marriage; with none, old-fashioned simplicity. Suetonius says, that when Vespasian came to the throne, laxity had exceeded bounds owing to the lenient administration of the law: the Emperor proposed in the Senate a law, making ladies who had relations with their slaves, themselves slaves. 'Everywhere in the city', says Martial, 'I ask if one woman says no: not one says no, just as though it were a crime or dishonour. Is no one true? Some there are; those who say neither yes nor no'. Tacitus commends the Germans for not laughing at vice, and not making seduction the spirit of the age. Juvenal's sixth satire is a caricature, but, at base, accurate. Marcus Aurelius was obliged to regulate the indulgence of women and noble youths: Cassius Dio discovered that Severus' laws against adultery (passed in his consulship) provoked 3,000 cases, and this only among the consulars and senators in the consular-senator Court.

In the year 211, when Septimius Severus made peace with the Caledonians, the Empress Julia jeered at a chieftain's wife, because of the community in wives: the latter rejoined, that Caledonian women selected the best men publicly, Roman women the worst and clandestinely. The name of an ancient cuckold was a 'horned beast'.

These expressions of opinion may be violent, unconsidered, and harsh; or rhetorically over-coloured, but the facts are significant, and some symptoms show the extent of the vice. Thus great frivolity, due to the arbitrary divorces, was shown in making and abandoning marriages. Under Julius Caesar's Dictatorship, a Praetorian married a woman, unsuspected of any adultery, but divorced two days before: Caesar separated them. Tiberius deposed a quaestor for divorcing a woman the day before the taking of the lots, he having wedded her the day before in order to rank as a married

man, In Martial one woman leaves her husband at the beginning of his praetorship, in January : it was no divorce, but a good speculation. Seneca says, some women counted their years, not by consuls, but by their husbands ; and Juvenal, that some divorced, before the green bays of welcome had faded on the lintels, and they might have eight husbands in five years : Tertullian, that women marry, only in order to divorce : these exaggerations must have a foundation in truth. Quintus Lucretius Vespillo (consul 19 B.C.) erects this stone to his wife Turia (who died 8-2 B.C.) : 'Seldom do marriages last until death undivorced : but ours continued happily for forty-one years'. But even in this marriage, after the death of her only daughter, Turia had proposed a divorce so that her husband might have children by a second—for childless men were under a disability in inheritance. She herself would seek him a new wife, and be a second mother to his children, and a sister or mother-in-law to him, whilst their properties should remain undivided. But the husband passionately refused. Trimalchio, too, congratulates himself on declining the divorce, proposed for the same reason, because of his good nature and love of a Stoic reputation. But most men were less fastidious : Ovid and Pliny the Younger had three wives ; Caesar and Antony four ; Sulla and Pompey five : such cases must have been frequent. A tombstone recently unearthed mentions a seventh wife ; there is no exaggeration in Martial's epigram : 'Phileros, you are burying your seventh wife on your estate. No estate has ever been more profitable'. Women remarried as often. Cicero's daughter Tullia married three times, and Nero was the third husband of Poppaea, and the fifth of Statilia Messalina. Martial speaks of a woman who made six or seven attempts at marriage ; of one who marries eight husbands ; and of a third suspected of murdering seven.

Further, slavery, as everywhere, left its track of immorality very visible in Roman conjugal life, and made the standard of a man's fidelity too lax. Plutarch even says, advising a cultured newly married couple, the wife must not take it amiss, if the husband resort to a *ἑραι'πα* or slave, but be grateful for his working his passions off on another woman, out of respect for her : just as the Persian kings used to dis-

miss their wives from the feast, and call in harlots and music-players for their debauches. And the women, too, took their share of male liberty as a right, or a pretext. Juvenal makes a woman detected in the arms of a slave or knight keep her complexion and say, 'we agreed we should each do exactly as we liked'. And ladies were certain of secret and submissive lovers amongst their slaves, and rarely resisted the temptation. 'Your wife', Martial says in an epigram, 'calls you a lover of girls, and is the darling of her sedan-chairman: you are both in the same boat'. Elsewhere he reckons up the seven children of a certain Marulla, whose faces betrayed as many slaves as their fathers, namely, the Moorish cook, the snub-nosed athlete, the blear-eyed baker, the nice boy of her husband, the narrow-headed long-eared *crétin*, the black flute-blower and the red-haired steward.

A further deleterious effect of slavery on women was the habit of cruelty, increased by the bloody amphitheatre. Juvenal's satires paint, how the moody mistress has her female slaves mercilessly flogged, without interrupting her work, till the floggers drop for weariness, and she harshly commands them to go out: Ovid, too, begs ladies not to scratch the maids who are adorning them, or prick their naked arms. Hadrian relegated a woman for such cruelty to an island for five years, and was the first to forbid slave-murder: until then women might at any time crucify their slaves.

Other corrupting influences for women there also were. The demoralizing effect of the letters of the day can hardly be counted as a cause (such as Ovid's *Elegies* and *Ars Amatoria*) though for flagrancy they could hardly be exceeded, but rather as symptoms of a not universal degeneracy. And with the wholly different standards of decency among women, much was proper, that is now impossible. Leibnitz even could send one of Hoffmannswaldau's most disgusting poems to Sophia, the widow of the Elector of Hanover (the mother of the first Queen of Prussia), and she could copy it out for the Dowager Duchess of Orleans (Elizabeth Charlotte), and every one was delighted with the 'amorous' verses; thus Roman women might well read Martial and Petronius, and stand on a higher moral footing. Martial dedicates his tenth book (which is not lacking in obscenities) to Polla

Argentaria, who was then about forty or fifty, the widow of Lucan, asking her not to be too severe. And the evil effect of immoral art is hard to estimate. Propertius reviles the wall-pictures that shocked the eyes of women and girls, and such pictures are elsewhere mentioned. But moral women seldom were thus exposed : in Pompeii even, a carnival of license, obscene pictures are only found in the brothels. In Paris of about 1750, profligate manners were far worse than in imperial Rome ; there the coats of arms on the coaches were replaced, at great expense, by disgusting pictures : a fashion introduced by the women, whose carriages were the more licentious.

In ancient Rome the worst influences were the ' temptations of the spectacles and excitements of the banquets '. Tacitus significantly says that the pure Germans withdrew their women from both.

The passion for the circus was one of the flaws most cast at the teeth of the Roman women of this day, in all ranks. The wife of a senator eloped with a gladiator, and Juvenal was most surprised at her abandoning the circus and Paris the Pantomime. And Statius, whose wife did not cling to the circus and the theatre, could not make out why she would not leave Rome. For women, as Ovid and others say, went there not only to see, but to be seen. Ovid compares the stream of fashionably-dressed women to ants or bees. It was then their toilette was at its height : when Rome seemed most magnificent, and they found most admirers. Tacitus and Dio think fit to mention the mantle of gold in which Agrippina appeared at the naval fight on the Lacus Fucinus (a sight so remarkable that Pliny thinks it worth mention), and this may indicate the zeal, the self-advertisement, and gorgeousness of the women. Often the feathers were borrowed. In Rome the Italian love of *far figura* was most deeply inset, and thousands wanted to seem more than they really were ; every kind of ' property ' could be hired, down to the rings which astute advocates had on to impose on the clients they were defending. Juvenal specifies amongst the things women borrowed, when their purses were empty, clothes, retinue, sedan-chairs (used as seats after the staves were pulled out), an old nurse and a blond maid. In Apuleius' fable, Venus makes Psyche fetch her

the elixir of beauty from Proserpine, in order to fit herself to visit the divine theatre.

The large feminine element at the circus attracted the youth in large quantity. Propertius rejoices at Cynthia's resolve to go into the country, away from the harmful spectacles; and Ovid recommends them as match-making resorts. In the theatre and amphitheatre, after Augustus' regulations, the men could only glance up at the upper seats reserved to the women: but, in the Circus, the sexes were mixed. 'Let such men go', says Juvenal, 'as think well to hallo, to bet high, and sit beside a fashionably-dressed girl'. Acquaintances were easily picked up by the common interest in the performance, and the little politenesses, handing cushions, etc.; and compliments, wishing one were the charioteer the girl admired; was it really hot? etc., etc. To the Christians this assembling of the sexes was the worst feature. 'In the circus', Tertullian says, 'there is nothing more repellent than the sight of men and women in their fineries. Partisanship often caused relations which might grow up into lust: people go there only to see and to be seen'. Clement of Alexandria also found that these assemblies of men and women led to profligacy.

Worse than this was involved in the Circus and the spectacles. There the populace raged madly, but it was more innocent than the theatre and amphitheatre. The *Atellana* and the *mimi* were openly licentious, and attracted the masses, whilst the pantomimic dances represented the most doubtful subjects and drew to them the upper classes: there anything was in good taste, and effeminate minds were tickled with witty obscenities. The Christians had good ground for condemning the theatres; any woman might well leave them sullied. The habit of seeing slaughter and torture in the arena brutalized the soul, and killed its delicate feelings to a nauseous extent.

Women were interested not only in the games, but in the actors personally. Athletes, circus-drivers and gladiators especially carried favour with ladies of the highest rank; the 'ferrum' attracted them like a lodestone, and enchanted fighters, however ugly, into Hyacinthuses: to run away with a gladiator, according to Juvenal, even noble ladies felt no scruples, faced sea-journeys and would even go to the

astounding extent of giving up the games. So, too, stage-singers, vocalists and musicians were beloved of the women, whose passion often led them into the wildest folly: thus, under Augustus, a married lady waited on Stephanio the actor in a page's disguise. Pertinax' wife had a publicly known liaison with a citharist; and rumour said these artists sold their favour dear. The instruments used by famous citharists were bought by their female adorers and worshipped. One noble lady in Juvenal makes a solemn sacrifice to discover whether a celebrated citharist would obtain the crown at the next competition; as much as she could have done for a sick son or husband. Pantomime-dancers, however, enjoyed the most signal favour from both men and women. Seneca, writing in Nero's latter years, says that there were many teachers and many scholars of the art of Pylades and Bathyllus. Everywhere in the city, homes have their private theatres, in which men and women dance, and husbands and wives vie to be the professional's partner. The pantomimes were very beautiful young men, whose art lent them fresh grace. About 22 or 23 A.D., they were banished from Italy, on account of the factions they caused, and their relations with women, who must have been of high rank: otherwise no such ordinance would have been passed. Mnester, the beautiful boy, the most popular pantomime under Claudius, had the favour of the elder Poppaea, the beauty of her day: and his enforced relations with Messalina caused his execution. Paris the Pantomime aroused Domitian's jealousy, and was assassinated in the street; on the spot where he fell, many of his adorers strewed flowers and scents. Rumour connected the murder of Domitian with the passion of his wife for this or some other pantomime. Marcus Aurelius bore Faustina's amours with more tolerance; some of them were said to be with pantomimes. Galen discovered the passion of one Justus' wife for Pylades, as Erasistratus had that of Antiochus for Stratonice. There was no physical reason for insomnia, so he concluded it was mental: her countenance and her quickened pulse betrayed her, when the name of Pylades was pronounced.

Tacitus mentions the temptations of the banquets as well as of the spectacles: but, at the worst of times, the most licentious feasts can never have been so common, that

women could not have avoided them : the spectacles must have created a far deeper disorder. At these extravagant banquets, the same evil influences obtained, as at the theatre ; for music, dancing and theatricals were the usual accompaniments. Obscene songs and plays met the ears of modesty, and the eyes of purity were offended by Syrian and Andalusian dancers, whose depravity could hardly have been less than that of the Egyptian *almés*. Many, says Plutarch, at their feasts present actions and speeches, more intoxicating than any debauchery, and when women and children are present.

Apart from such sensualities, banquets enabled men and women to meet far more conveniently than in the Circus. At them, says Pliny the Elder, greedy eyes are calculating a woman's price, and sodden eyes (of their husbands) sleepily assenting. In one of the most impudent poems ascribed to Ovid, the seduction of the beautiful wife of a simple husband is described ; nominally it is Paris and Helen, but these were current names for such parties ; and the picture is drawn true to the actual life of that day, most realistically. The lover's behaviour at table corresponds to Ovid's advice in the matter. The lady feels the fixed gaze of her admirer, hears his sighs, sees him seize her cup, kiss it where her lips touched it : he makes signs to her with his eyes or fingers, writes in wine on the table, tells love-stories eloquent of his own passion, pretends drunkenness, to make his audacity seem innocent. Further, the old custom of women sitting at table had ceased by Augustus' time ; they lay down, like the men. In the old days, this would have been indecent, but, under the Empire, the old rule was only kept up at the Capitol, when at Jupiter's banquet, Jupiter lay down and Minerva and Juno sat up on chairs. 'It is more important', said Valerius Maximus, 'that the gods keep up the good old customs, than that the women should'.

How far, apart from the banquets, real social meetings of both sexes occurred, we do not know. Men could also converse with women in the public places, walks, colonnades, parks and gardens. In the stead of the page or eunuch, who accompanied his mistress, some lover would hold her parasol. Further, women of the upper classes seldom walked on the black basalt pavements. They were carried about in sedan-chairs, or the huge palanquin borne on the shoulders

of gigantic foreign slaves: the palanquin, especially the covered sort, was the prerogative of the senatorial women, though custom varied and was not absolute. Caesar limited the right of using the palanquin to matrons and mothers over forty years of age, and to certain days of the year: Domitian refused it to women of ill-repute. Sterner custom required thick curtains, so as to baffle the greedy gazers: 'we see nothing blameworthy', says Plutarch, 'in staring fixedly at ladies' palanquins'. But husbands who forbade their wives, 'to exhibit themselves in their chairs to the gaze of any one and everyone', were deemed, as Seneca says, boorish, and tyrannous. With open windows they would peer about in all directions, bowing, and disgracing their position. For in Rome, there were no carriages: in the country, women often drove themselves.

In dress, too, the women of that time showed no more sense of shame, but our information, coming from violent generalizations of such writers as the Senecas and Pliny the Elder, cannot determine the extent of this, especially of the use of the notorious Coan robes; and all the less certainly, as similar complaints were raised all through the Middle Ages and in modern times, e.g. in the tenth, thirteenth, fourteenth, fifteenth, seventeenth and eighteenth centuries. The transparency of female clothing under the *directoire*, with its Mdme. Tallien, and at Grodno under Stanislaus Augustus, with Marquise de Lulli, can hardly have been exceeded. Then, in Paris, an especially admired toilette, with all the cameos and gold, weighed only one pound. After her, ladies aimed at lightness, and imponderability of costume. Historians of the first centuries decry the fineries and extravagance of female dress, the oriental stuffs (such as silk, byssus, jewels, pearls and perfumes), which may have been extravagant and not restricted to a section of society, but is outdone by modern luxury.

Independence made Roman ladies seek to cast off the fetters of nature and custom and follow male pursuits. Such abnormalities, as Juvenal depicts, may have been rare: such as the women who drilled in gladiators' armour, challenged men in night-long carousals and vomiting of wine, or the women who pleaded in Court. Such emancipations were, as Juvenal says, the exception. More frequent were women with active

public interests. They knew all that was going on in the farthest lands, caught up rumours at the gates, or originated them; retorted sharply on military leaders, and told any street acquaintance all the world's gossip.

The ambition of others, more cultivated, took higher flights: most women in high position naturally sought to lead, directly or indirectly, in the course of politics. Often, as is known, the fate of the Roman world was decided by women; more than one Emperor was more or less the vicerent of his Empress. Even Augustus, one of the greatest statesmen of all times, often took counsel with his clever wife, a Ulysses in female garb, as Caligula called her; and it was reported that he always wrote down what he was going to say to her. To the good done by Eusebia, the consort of Constantius, Julian adds that 'one man was reinstated in his paternal heritage, another pardoned from a merely legal penalty, a third saved from imminent danger of an information, and many received honours and benefits'. Trajan's widow, Plotina, made Hadrian give the president of the Epicurean School at Athens the right of nominating his own successor, and even an alien. Philiscus the sophist secured the chair of oratory at Athens, through Julia Domna. The influence of the Empresses' Court-ladies must also have been very great. Juvenal illustrates how their favour was sought after. He blames the extravagance of Domitian's favourite Crispinus, in buying a six-pound mullet for 6,000 sesterces: as a present to a distinguished lady in a huge paned palanquin, it would have been justified. In both big and little appointments feminine influence would predominate, in Rome and the provinces. Seneca praises his maternal aunt for overcoming her shyness, and helping him to his quaestorship. Gessius Florus owed his procuratorship of Judaea to his wife Cleopatra, a friend of Poppaea. To the Chief Vestal Campia Severina, in 240 A.D., a statue was erected by a man for whom she worked his knighthood, a tribunate of a cohort, and the lapse of one grade in military promotion; and another statue by a man who thus secured the chief imperial librarianship. In Epictetus a dishonest official hopes to escape punishment, for 'we have friends, gentlemen and ladies, of influence in Rome'. Ladies would, in case of need, exploit their sons for this purpose. Some

of the electoral recommendations, inscribed on the walls of Pompeii, are signed by women.

In the provinces the wives of the governors attended the manoeuvres, and, with a bodyguard of centurions, mixed with the soldiery: e.g. the proud Plancina, daughter of the founder of Lyons, Munatius Plancus, and wife of Gnaeus Piso (A.D. 17 Governor of Syria), and Cornelia, daughter of the governor of Pannonia, Calvisius Sabinus (who died in 39 A.D.). Plancina's ostentation was the main argument in favour of Severus Caecina's motion before the Senate, to forbid (A.D. 21) a governor taking his wife with him. The Senate should remember, that the women caused so much of the extortion, and attracted all the riff-raff of the province. They took up negotiations and the provincials had to attend two courts. Women were more domineering and less restrained than men; they became absolute despots of home and law and armies. The motion was not accepted; but later times record such wives as 'harpies clawing for gold, spreading havoc in cities and diets.'

In literary life, too, women took their share; in the upper classes, in their youth, they were educated up to it. Quintilian, in his *De Institutione Oratoria*, says, both parents should be as cultured as possible, not only the father. Martial's ideal woman is rich, noble, erudite and chaste. Ovid, who in his *Ars Amatoria* assures the reader he is speaking only of libertines, but is nevertheless describing women, says: 'There is a small circle of learned women, genuine or specious'. How intense and general the love of literature was in the first two centuries is well known, as also the habit of poetic dilettantism. In Augustus' home, which constantly encouraged literature, the women had to embrace it. To his sister Octavia a philosophic work was dedicated: Virgil read the sixth book of the *Aeneid* to her and her brother: she is said to have fainted at the prophecy of the early death of her son Marcellus. Crinagoras of Mytilene the poet, who was twice (29 B.C. and 26 B.C.) ambassador to Augustus from his native city, was a close friend of the family. His poems on Marcellus and Antonia, her beautiful and virtuous daughter, the wife of Drusus, are extant: one was the dedication to a volume of lyrics, and the other is a prayer for her happy delivery, and others again, on her son Germanicus

(born 15 B.C.). The wife of the tragedian Varius (whose Thyestes Augustus had acted at his triumph and munificently acknowledged) was learned: Perilla, perhaps Ovid's stepdaughter, was a poet. Lucan's wife Polla Argentaria, according to Statius, was highly gifted. In the later Empire, we only know that Agrippina, the mother of Nero, left memoirs, which Tacitus and Pliny the Elder used; and Statilia Messalina, Nero's third wife, after his death became as notable for her intelligence as her riches and beauty, and regularly studied oratory: of Julia Domna, the wife of Severus, more will be said later. The daughter of Nazarius the rhetorician (under Constantine) was her father's equal.

Women, who did not take any active part in literature, at least shared in their husbands' or friends' work and success. Pliny the Younger lauds his wife, for interesting herself in it out of love for him. She read his books through and through, and learnt them by heart. If he gave a recitation she would listen behind the curtain to the applause. She had a system of couriers to bring messages from the court in which he might be pleading. She set his poems to music and sang them; love being her sole teacher. Apt expression was a common feminine gift. Ovid recommends women to write love-letters in good but not stilted Latin; for a passion nigh to extinction might be revived, or a lively flame deadened, by beauty's bad grammar. Women's works, if not published, were shown to their friends. Pliny says that an author he knew read out his wife's letters: she might have been a Terence or a Plautus. If they were really her composition, her power testified to the influence of her husband who married her as a girl: for girls' education must have proceeded after marriage in many cases. Women also experimented in speaking Greek instead of Latin, or at least interlarding Greek phrases: in Lucretius' time Greek was the lovers' language; Juvenal says in young girls this might be endurable; after twenty-six, it was intolerable.

But in an epoch of teeming poetasters, poetesses were common, in Greek and Latin, who loved being called Sapphos. Ovid applied this hackneyed compliment to Perilla, whose poetic gifts he endeavoured to develop, as her hearer, teacher and critic. Sulpicia, whose love-letters in verse were included

among those of Tibullus, was probably a granddaughter of Servius Sulpicius Rufus, the jurist, and daughter of a friend of Horace's. Hostia, the lady-love of Propertius, was compared to Erinna and Corinna. Persius jeers at these 'poetic magpies' of his day. Of Theophila, the bride of the poet Canius Rufus of Cadiz, Martial, his fellow-countryman, says she was chaster than Sappho and as gifted; he applies the same term to Sulpicia, the wife of Calenus, to whom is attributed a sickly 'Conversation with the Muse'. In those poems of hers which Martial read, she celebrated the joys of happy, unprudish marriage. On the colossus of Memnon there are Greek verses of Caecilia Trebulla and Julia Balbilla inscribed. The latter mentions with pride her descent from Claudius Balbillus (governor of Egypt under Nero, and an author) and a Syrian prince Antiochus; she was of senatorial rank: a statue was put up to her at Rome by the city of Tauromenium, and ascribes to her distinction 'in every virtue and morality and wisdom'. A.D. 130 she visited the colossus in the train of Hadrian and 'the gentle Empress' Sabina, who seem to have liked her verses, and had them chiselled in deep into the hard stone. The honour may have been earned by the plenteous adulation; Memnon is said to have risen before the sun to greet his dreaded master, and much more in this vein. Balbilla's verses show fluency and accurate pedantry in the use of the Aeolic of Sappho, her obvious model.

Ladies, when not poets, were critics, and as such, deemed by Juvenal worse than tipplers. Before they had been five minutes at table, they began to discourse aesthetically on Homer and Virgil, monopolizing the conversation, with a hammer and tong-like effect. They paraded their snacks of knowledge, made quotations from forgotten authors; grammar in hand, corrected their friends' slips. A woman, says Juvenal, may have the encyclopaedia by heart and yet know nothing: Martial, too, mocks the purist woman, and yearns, as his life-wish, for a not too learned wife.

Philosophically inclined women found the greatest hindrances. Old-fashioned Romans discouraged the study, as merely ostentatious (Seneca the Elder, a great conservative, would only allow his wife to read very superficially—a fact the son regrets): and also, as making women impertinent,

and leave the loom and home, to linger on with men, talk learnedly and chop logic. The Stoics held the opposite opinion. Zeno had originally advised the bringing up of boys and girls similarly: Musonius Rufus wrote a monograph on 'whether daughters should have the same education as sons': as did Plutarch 'that women should have a scientific education'. Musonius Rufus wanted to restrict women to moral philosophy, as the indispensable foundation of chastity: Plutarch went further, and, after the Socratic fashion, prescribed astronomy and mathematics as well, as safeguarding a mind filled with the highest ideas from love of vanity, superstition and folly; as making dancing ridiculous for a mathematician, and exorcisms ridiculous to the student of Plato and Xenophon.

As a fact, women often did study these sciences as well, to the detriment of their charm. Plutarch says of Cornelia, wife of Crassus and then of Pompey, that to beauty she superadded the graces of literature, music and geometry; she had attended philosophic courses to her advantage, and was free from the general ill-consequence of becoming a blue-stocking. Cicero's friend, Caerellia, 'fired with zeal for philosophy', made a copy of his *De Finibus* before publication. And spiritual minds might well find consolation in the teachings of the wise, as Livia, at the death of Drusus, in the words of the Stoic Areus. Athenodorus of Cana, another Stoic at the same Court, was privileged to dedicate one of his writings to Augustus' sister, Octavia. Julia Domna, when Plautianus the favourite intrigued her into quarrelling with Severus, devoted herself to philosophy and science. She had mathematicians and rhetoricians all around her; Philostratus, at her instruction, wrote the novel of Apollonius of Tyana. Martial's poetess, Theophila, knew the Epicurean and Stoic systems equally well. In a writing attributed to Galen, Arria, a friend of the author, is mentioned, who was in high esteem with Severus and Caracalla for her earnest study of Plato; possibly the same devotee of Plato to whom Diogenes of Laërte dedicates his *Lives of the Philosophers*.

But, for the most part, it was sheer toying. Horace satirizes the old lady in love, and her Stoic books on silk cushions. In Epictetus' day, Plato's Republic was the fashion, as,

in some measure, laying the foundations of a Utopia in free love and community in women: Lucian asserts some philosophers realized that teaching with their female pupils, but not in Plato's apprehension of it. With Marcus Aurelius the philosopher, ladies took to seeing Greek Dr. Know-alls, rhetors and philosophers, solemn grey-beards, to attend their walks. At table, or at their toilette, they had leisure to be instructed: in the course of a lecture on morality, there were interruptions, a *billet-doux*, swiftly answered by return. These philosophers were taken on journeys as well, kept waiting in the rain, and sent in the last carriage with the dancers, the cooks, and the hair-curlers. Lucian tells of one rich lady who entrusted her Stoic with her Maltese lapdog, which gave birth to a litter under the philosophic mantle.

At all times, most women must merely have played at philosophizing, and some few have discovered a religion in it. The interest of the widow-Empress Plotina in Epicureanism has been mentioned. Plotinus, the founder of Neo-Platonism, stayed in Rome after 244 A.D., and had many devoted female students, some in the higher ranks, amongst them Salonina the Empress; with her and Gallienus' favour, he hoped to found on the site of a lost city in Campania (probably Pompeii) a Platonopolis or Philosophers' State. His opponents frustrated him, and antiquity never had its Icaria. Porphyry, his pupil, married a friend's widow, Marcella, to support her in her struggle with disease and the education of her five children, and because of her great gift for philosophy, into which she had been initiated.

The religious movements of the first century, which increased in the second, and in the third and fourth attained their height, affected women most. These were the last efforts of Paganism to regenerate and oppose the new spirit coming from the East. The old gods gained a fresh lease of their lapsing life, and the new habit of honouring their positive attributes found many votaries, who, in a wild confusion of all religions and cults, sought salvation.

Of these, oriental rites prospered the most. Their pomp and sensual effect, their gorgeous ceremonial impressed the simple; their miracles and mystic initiations were a

revelation, and a road to union with God. These rites especially suited women, and the promise of purity and a hallowed state beyond gained them great vogue. License led to asceticism; the weakness, subject to temptation, sought release through overt atonement.

Thus the yearning of women, especially, to find here a consecration, a cleansing or a consolation, became passionate; unsuperstitious piety (ascribed to one woman on her tombstone by her husband) must have been rare. Plutarch recommends the wife to reverence only her husband's gods, and ban other worships and superstitions, as clandestine offerings would be offensive to any god. These female devotees were blind adherents of the oriental priests. A wandering band of begging priests of the Great Mother might persuade them to offer one hundred eggs to divert the September fever from them to their clothes, or, three times in the early morning, to dip in the half-frozen Tiber and splash about almost naked on their knees for a certain distance. They would make pilgrimages to Egypt to fetch Nile water, if Isis bade them sprinkle themselves with it in the temple. Isis, the goddess of a million names, was, throughout the Roman world, adored as protectress and Lady of Mercy. After 50 A.D. she had many temples in Rome to which pilgrims came in the prescribed linen garb, with dishevelled hair, sang hymns twice a day, were sprinkled with Nile water, observed the fasts, and any other abstention, enjoined by the priests: any default was met with a petition to Osiris and a substantial oblation: a cake or fat goose might assuage the angry gods.

It is no matter of surprise that, when women so frequented the temples of Isis, many abuses sprang up. The whole priesthood, men and women and servants, were accused of being professional prostitutes, and the cult was condemned on this score. An event of 19 A.D. illustrates the happenings inside the temple at Rome. A knight, Decius Mundus, had been wooing a spotless and noble woman, Paullina, in vain. She was a devotee of Isis; the priests of her temple were bribed for 5,000 denarii to persuade her that the god Anubis desired to meet her at night: Mundus appeared in this disguise. Tiberius came to know of the outrage, banished the ringleaders, crucified the priests, demolished the temple

and threw the statue of the goddess into the Tiber. Not only Isis, but any other deity, beloved of the women, saw his temple thus misused : as Juvenal testifies and the Christians also, though they exaggerate in denouncing temples and groves and holy places as places for assignations and criminalities. In the temples, according to Minucius Felix and Tertullian, adulteries are arranged, prostitution practised between the altars, and the incense-laden cells were brothels. Tertullian makes Idolatry thus declaim : 'My sacred groves of pilgrimage, my mountains and springs, my city temples, all know how I corrupt chastity, and magicians and poisoners know, how I encourage vengeance, sweeping the watchmen, informers and accomplices out of the way'. Propertius, too, calls the temples and the circus the main reasons of Cynthia's untroth, and Ovid recommends them and the Jewish sabbaths and the theatre and porticoes for this purpose.

Judaism was spreading more and more in the West, but its proselytes were mainly women, amongst whom was Poppaea the Empress. Josephus calls her a zealous advocate of the Jews, 'for she had religion in her' : for this reason she was not cremated, but, in oriental fashion, embalmed with perfumes and buried in the cemetery of the Julii. In A.D. 19, together with the proceedings against the worship of Isis, the first harshness was shown towards the Jews ; 4,000 able-bodied freedmen, 'infected with Egyptian or Jewish superstitions', were sent to Sardinia to fight the bandits ; the others had to repudiate their practices or leave Italy. The pretext was a fraud, imputed to the Jews, on Fulvia, a noble Roman lady inclined to Judaism, whose Jewish teachers had incited her to send a contribution to the temple at Jerusalem, which they appropriated. Under Domitian, A.D. 88, Martial jeers at the bad breath of ladies who kept the Sabbath.

Christianity, too, inflamed the women, and its emissaries did not underrate the value of feminine susceptibility. At first it affected the lower classes. In the second century, the pagans scoffed that the Christian community consisted of the poor, of workmen, old women, slaves, children and simpletons. Perhaps, however, as in the East, Christianity began to claim feminine votaries in the higher ranks as well. But the assumption that Pomponia Graecina, the wife of

R. L. M.

S

Plautius the consul, the conqueror of Britain, was one of them, rests on very insecure evidence. In 58 A.D., she was accused of the 'foreign superstition', and the judgment left to her husband, who acquitted her. The phrase meant either of the religions persecuted by Tiberius, the Egyptian or the Jewish. She did mourn a murdered relative for forty years and withdrew from society, but pagan women also showed similar life-long attachments. And the ancient Christian tradition knows nothing of her as a convert, whilst the legendary personal relations between St. Paul and Seneca prove on what slender facts they would make distinguished pagans converts. Much more probably she had become a Jewess. It is more possible that Domitian's niece, Flavia Domitilla, became a Christian. She and her husband, Titus Flavius Clemens, were accused of 'atheism'; a charge which had brought to many death or confiscation, for Jewish practices: he was executed, and she relegated to an island. Perhaps, as Renan presumes, many of these victims of persecution were Christian Jews. The hagiologies (composed not before 500 A.D.), which make St. Cecilia (the patroness of music) a senatorial woman, are entirely untrustworthy.

From the death of Marcus Aurelius to the great persecution of Decius was a time of peace for the Church, in which she flourished exceedingly. Under Commodus, whose mistress Marcia was, probably, a Christian, whole noble families were converted: Septimius Severus, in his first years, took senatorial men and women, who were openly Christians, under his protection; Mammaea, the mother of Alexander Severus, is said to have been finally converted by Origen's lectures. These great proselytes created many difficulties for the Roman Church, and even the zealous Tertullian permitted them the gorgeous clothing due to their rank. Callistus the bishop (218-223) allowed girls and widows of senatorial rank, who did not wish to lose it through an inferior marriage, to enter into concubinage, even with slaves, and publicly showed his preference for these illegal and anti-social marriages to alliances with infidels. The monuments in the catacombs contain the names of many noble Roman lady converts. In the crypts of Lucina, the sarcophagus of one Catia Clementina has been found, the wife of Jallius Bassus, a high official under Marcus Aurelius, as also of her daughter, Jallia

Clementina, and her sister or daughter of the same name : inscriptions are also found there of Annia Faustina, Licinia Faustina, Acilia Vera, who belonged to a family related both to the Antonines and to the Pomponii Bassi.

Even though no word had come down of the broken hearts and family divisions, the centuries of conflict between paganism and Christianity would assure them. Origen says that the Christian emissaries ventured to interfere with the most intimate family relations ; that Christian slaves, as the pagans alleged, would seek to convert their master's wife and family, and incite insubordination against fathers and teachers. One incident, narrated by Justin, a Christian author under Antoninus Pius, must have been a common type. One married couple lived very loosely, and the wife became a Christian, but all her new-born zeal and preachings of Hell could not convert her husband : at length, fearing, as his wife, to be tainted with his godlessness, she obtained a divorce. In this case morals, as well as religion, jarred : in most, the diversity of belief, and the pangs of conscience were sufficient to dissolve a life-long alliance ; the number of Christian women who could manage to be 'Christians among the Christians, and heathens among the heathens' (as an inscription runs) could never have been great ; too often 'love and troth had to be weeded out'. Christian writers naturally attribute all the guilt of such partings to the pagans. But the harshness with which Tertullian stigmatizes mixed marriages as improper and irreconizable by the community, indicates that the divorces were often enough led up to by the Christian missionaries. Sometimes an equal fanaticism of the pagans might withstand them. Porphyry gives the answer of an oracle of Apollo to a man who asked how he should deflect his wife from Christianity, and what god he should implore : 'Sooner couldst thou write on water, or fly in the air, than change the mind of thy guilty, godless wife. Let her have her will, remain with her empty falsehoods, lament to her god with her faithless lips ; her God whom just judges condemned to an evil death.'

But women then, if religiously the 'leaders in belief', were as obstinate adherents of every old faith as they were susceptible to every new superstition. Of the variegated and innumerable superstitions of these changeful centuries,

men were only influenced to a very considerable extent by one very influential form, astrology. This was also very popular with the women : it was practised more than elsewhere in the upper classes. No astrologer, says Juvenal, is of repute, unless at least once condemned : the star-readers became most celebrated, if they had been involved in some political action, and had lain in chains for long, and been amnestied and relegated to a barren island. Some women, too, were expert astrologers themselves, and consulted the calendar at every turn. Many, too, when they were confined, had a Chaldaean posted on some observatory near at hand, to watch the stars, and to be informed by a gong of the instant when the child was born : he was then to draw up the horoscope at once. St. Augustine tells of two friends of his, so devoted to astrology that they noted down accurately the instants of the births of their domestic animals and the ruling constellations. Once the wife of the one and the slave of the other gave birth at the same time exactly, and under the same constellation. Yet the one remained free, and the other a slave : St. Augustine's belief in astrology was finally destroyed.

But magic, in all its departments and hoaxes and barbarities, was fervently believed in by women. Under the influence of oriental mysticism, however, the character of this superstition became wholly transformed in the second century. In the first, witches, loathly and abominable hags, practised doubtful trades, and procuring : they concocted salves and drugs and philtres for beauty, and dealt in poisons, and were very fond of wine. This profession was too proletariate to suit the educated, and yet was sought by women, who believed in love-philtres : Plutarch even in his *Marriage Precepts* mentions them, though his work was intended for an educated couple.

But, when transformed, magic gained greater vogue. After about 150 A.D., when Neo-Platonism was fore-heralded by Julian the Chaldaean, philosophy became more and more contaminated with theurgy and magic. Apuleius says that the populace associated philosophy with enchantment, and that both magicians and natural philosophers drank more and more of the Pierian streams of the East, the Nile, the Euphrates and the Ganges. Now sodden procuresses

were replaced by pious and holy miracle-workers, who either came from the East, or had spent many years in catacombs of Egypt, or the society of Brahmans; who were passion-free, despised earthly nutriment, went about in white linen, venerable, and welcome guests in great palaces. These later conjurers—no mere hags or witches—made their holiness of life the secret of their power; their humanity was conquered, and, god-like, they had divine powers. Their success was largely due to the women, whom they courted assiduously. They took great care of their personal appearance. Lucian describes Alexander of Abonuteichos, as a stately man, with white skin, a well-tended beard, a mystic's eye, and musical voice: he wore a deceptive wig of graceful locks over his own hair, went about in a white and purple vest and a white cloak, carrying a scythe in his hand, to typify his descent from Perseus. The grace of the ladies was assured to him, even, says Lucian, at the wish of their husbands; and their favour was the aim and the foundation of his position. Perhaps much the same would have been said of Apollonius of Tyana, had Lucian written his life. Philostratus mentions that the tale was that he had loved a beauteous lady in Seleucia in Cilicia, and she gave herself up to him, to be blessed with great children, as he was superhuman: thence sprang Alexander Peloplaton the sophist, an extremely beautiful man. But Philostratus scouts the story as incredible.

Literature prefers dwelling on the frailties and vices of women, as being better copy, than on the inconspicuous virtues; and most of this description is thereby limited to the evil side. But some marriages are described in which man and wife 'in mutual love, and alternative submission lived in harmony; in which the merit of a good wife is greater than the guilt of a bad one', or in which mothers and wives 'were the light of the home'. The principal source for this gallery of good women is Pliny's Letters. He tells of the heroic death of a woman from his native Comum, not less great than Arria. He was crossing the Lake of Como, and a friend pointed out to him a villa jutting out over the water. There the husband, who had been suffering from tumours and boils, showed them to his wife, and asked if she thought them curable. She thought them hopeless; encouraged

him to commit suicide, and was not only his companion but his guide as well; they bound themselves together and plunged in to their death.

History, too, records many great examples of feminine courage in the days of the lowest depths of humiliation and servility. In the Terrors, when women were prosecuted for their tears, they often led men on to bravery, faith and self-sacrifice; just as, under the proscriptions, wives were faithful to the outlawed and sons faithless. In the barbarities of the Julian house, women often preferred to die with their relatives, whom their entreaties could not save; mothers followed their sons into exile, and wives their husbands. Tacitus gives a few instances. Annia Pollitta saw her husband Rubellius Plautus (A.D. 62) assassinated by Nero; she embraced his blood-stained neck, kept the stained robe, and lived on the bare necessities of life, in deep mourning. In 65 Lucius Vetus, her father, was also tried for his life: she in vain besought Nero's mercy and decided to share his fate, as did also Vetus' mother-in-law Sextia. Vetus gave all he had to his slaves, reserving only three beds: on these the three lay and with the same knife cut their arteries, and then each, decently wrapped in a cloak, was carried into the bath. 'The father fixed his gaze on his daughter, and the grandmother on the granddaughter, and they on him; and all prayed for a speedy death.' Fate respected their ages; the two elder ones died first, the youngest last. Servilia, the wife of Annius Pollio (banished in 65 A.D.), was in 66 involved in the accusation of her father Soranus, for anxiously prognosticating the issue of the suit by unlawful magic. Each endeavoured to shift the guilt off the other: both were condemned, with a liberty of choosing the manner of death. Seneca's wife Paulina chose to die with her husband, after the discovery of Piso's conspiracy: both opened their veins, but she was restored to life: 'and lived on several years, faithful to her husband's memory; her paleness showing how near she had been to death'. From an inscription on a rock-tomb at Cagliari the following story comes. Cassius Philippus had been banished to Sardinia (a usual place), and his wife Atilia Pomptilla followed him: he fell ill, perhaps because of the climate, and she resolved to die with him in the twenty-second year of married life: she died, he

survived. Perhaps these sacrifices of life by wives were due to the belief that the Nethergod would accept another life in substitution. A Greek inscription speaks of a new Alcestis, Callicrateia, 'who died for her husband, Zeno; the only man she had embraced, and dearer to her than the light of the sun or her children.'

But most famous of all women, whose courage transcended that of men, is Arria, who plunged the dagger into her own breast, withdrew it, and gave it to her husband, saying, '*Paste, non dolet.*' Pliny the Younger records other not less brave and characteristic sayings of hers. Once both her son and her husband lay dangerously ill. The son, the hope of his home, died; Arria buried him without informing Paetus, and simulated calm in replies to his inquiries: he was resting, had taken nourishment. When tears would break forth, she left the sick-room, and returned with dry eyes and a quiet countenance. To play the mother, after ceasing to be mother, was, in Pliny's eyes, a greater triumph than to show Paetus how to die. In 42 A.D. Paetus was condemned to death for complicity in Scribonianus' conspiracy in Illyria against Claudius. Scribonianus was killed and Paetus brought to Rome. Arria in vain sought to embark with him, as the slave allowed to a man of his rank. She wrote to Scribonianus' wife, who acted as a witness before Claudius: 'Am I to listen to you, alive, after your husband died in your lap?' Her son-in-law besought her not to kill herself, asking her if she wished her daughter to die with him, if he must. She replied: 'Yes, if she have lived so long and so happily as I with Paetus'. This answer made her family all the more anxious. She was watched, and said: 'It is useless: you can make my death hard, but not hinder it'. Thereupon she leapt up from her chair and dashed herself against the wall. She was revived, and said, 'I told you I should find a road to death, easy or difficult'. Posterity was to associate Arria with the faithful wives of heroic legend. On the tomb of a lady at Anagnia, the husband begs her and Laodamia to receive her soul among the blessed assemblage of Roman and Greek women.

Arria's daughter, Caecinia Arria, at the condemnation of her husband Thrasea in 60, wanted to follow her mother's example: he persuaded her to remain alive, and not deprive

her daughter of her only help. The daughter, too, Fannia, was worthy of her mother and grandmother. In 66 B.C., and under Vespasian, she shared the exile of her husband Helvidius Priscus, and after his execution in 93, for his sake, underwent the same punishment for a third time. Herennius Senecio, a friend of Helvidius, wrote his life, and was accused on this account: she acknowledged that she had incited him, given him papers, and denied any complicity of her mother: threats and dangers wrung nothing further from her. Herennius was executed, Fannia exiled and her goods confiscated. She took the book, which had occasioned all this, with her into her banishment, in which she joined her mother, though the Senate interdicted it and ordered its destruction: both returned 97 A.D. Pliny testifies to her charm, and her claims to love and reverence, as a model to future wives.

These facts only refer to women of the upper classes, and even of them give a set of merely fragmentary and isolated pictures. As to the middle classes and the lower, literature is almost dumb. Only their tombstones have been preserved, inscribed by their husbands with their virtues: one quaintly truthful widower says: 'On the day of her death I testified my gratitude to gods and men'. But all tombstone virtues of all women must have been similar, as a long eulogium of Murdia, a lady who was not noble, shows (circa 50 A.D.): 'The praise of good women is always simple and the same: their virtues are Nature's gift, which they treasure up, and are not diverse: sufficient if each be worthy of the same good repute: a woman, whose life has few vicissitudes, can gain no new fame: they needs must strive after the one common object, lest one omission spoil their life. My mother was the more famous; she was, like other women, and not less than they, modest, honest, chaste, obedient, industrious, careful and faithful'. Thus, too, Lucretius Vespillo, the consul, on his wife Turia: 'Why mention domestic virtue and chastity, and submissiveness, geniality, the ready loom, modesty in attire? Or your love to your kin, and my kin, of my mother as of your parents? This is all common with all honourable women'.

The sphere of woman was thus conceived in the middle classes at all times: hence these inscriptions may be grouped

together apart from the diversities or uncertainties of place and time and rank and position. Inscriptions, describing the 'rarest, sternest, most incomparable wives', may be generous of superlatives, but only indicate for what woman was prized. One Republican inscription makes the stone speak: 'Short, wanderer, is my message; halt and read it. The loathly stone covers a lovely woman. Claudia her parents called her: she loved her husband; bore him two sons; one she left on earth; the other the earth now covers. She was of proper speech and noble gait, kept her house and spun. This is all. Go'. For women to have had only one husband (the *univirae*) was a merit, rare in those days of early marriages and easy divorces and remarriages. One imperial freedman celebrated the example of his wife's chastity, and herself giving her sons suck: another widower lauds his wife, as the 'nurse of senators'. Often a deep affection may be thus recorded. One inscription runs: 'Here lie the bones of Urbilia, wife of Primus. She was dearer to me than life. She died at twenty-three, beloved of all'. Or again: 'To my dear wife, with whom I passed eighteen happy years: for love of her, I have sworn never to remarry'. One wife who died at the age of twenty-five is made to wish her daughter may learn from her how to love a husband. One monument put up by a widow is inscribed (as are many others): 'What I had hoped my husband would do for me, I have done for him'. One common tomb of man and wife was put up by the widow, who, after thirty-five years of married life, would lie by him in death. '*Vale, consolatio mea*' another widower inscribes his wife's stone. On the monument of a freedman and a freedwoman, the only words are: 'I am awaiting my husband'. The words 'never have I endured aught from her of evil save her death', or 'never have I had an ill-word from her', became a mere form. Elsewhere we find husbands mourning their wives with whom they lived 'without strife', 'without anger', 'unwearied'. An imperial freedman praises the absence of desire in his wife. A widower says that to laud his wife sufficiently, he ought to inscribe her virtues in letters of gold. An imperial chamberlain who had come to Carthage (perhaps in Hadrian's retinue) erected a monument to his wife who died there at the age of seventeen, 'because she

followed him to Africa': a similar eulogium is given to a wife at Rome for a similar proof of faithfulness. A Roman inscription runs thus: 'To a virtuous wife, and careful house-mistress, the desire of my soul, who has been with me eighteen years, three months and thirteen days. I have lived with her without one complaint, but now I complain to her *manes*, and either demand her back of the Nethergod (for she has lived with me in unison up to the fatal day), or I beg of thee, Mevia Sophe, to put an end to my intolerable solitude, if indeed there be departed souls. Stranger, may the earth rest lightly on thee, if thou disturb naught: if thou do, mayst thou be hateful to the gods; the earth lie heavy on thee, and the underworld refuse thee'. Often even the hours, not only the days and months, of marriage, are recorded; in consequence of the habit of carefully calculating the hours of birth for astrological purposes, these accurate figures are very common and prove the enormous vogue of this superstition. Thus Pliny tells of how Verania (the widow of Piso, who was adopted by Galba) fell ill, and answered Regulus' question as to the hour of her birth: he forthwith cast a horoscope for the length of her life. A widower in Lyons begs those who read his wife's tombstone to go to the Baths of Apollo and bathe there, as he had done, and wished he still could. A widow recommends her husband to the Nethergods, and begs them to send his ghost up to her at night-time.

The domestic virtues usually celebrated are their good house-keeping and spinning. An imperial slave, a *dispensator* in Lower Moesia, says of his wife: 'she was the patron-saint of my home, my hope and my life. Her wishes were mine; her dislikes mine. None of her secret thoughts was concealed from me. She was a busy spinner, economical, but generous to her husband. She did not delight in eating, save with me. She was a good counsellor, prudent and noble'. A huge sarcophagus in which another small one was found, is thus inscribed in clear letters:

AMYMONE, THE WIFE OF MARCIUS, RESTS HERE: GOOD WAS SHE AND FAIR:
A BUSY SPINNER, A GOOD HOUSEWIFE, CHASTE, MODEST, AND PIOUS.

Unfortunately these inscriptions have not more individual tone, and thus withhold many a glimpse into women's inner

lives. History records from her conning-tower only those women who rise above the mass ; whilst a history of morals, in seeking to combine disconnected impressions, with the utmost quest of truth, cannot escape being merely subjective.

CHAPTER VI

MEANS OF COMMUNICATION

I. COMMUNICATIONS BY ROADS

(i) HEINRICH STEPHAN (who died in 1897), who was one of the greatest authorities on modern modes of intercourse, has said : 'Most of the realms of the ancient Roman Empire had better connections and conditions than ever afterwards or even now'. This chapter will show how much the ancient world owed, in the matter of facility of intercourse, to the Empire, an epoch 'calumniated rather than known', and how far the Middle Ages, and even modernity, is inferior. Travelling throughout most of the Roman Empire was easy, swift and secure to a degree unknown until the beginning of the nineteenth century ; occasions for changing residence were far more numerous than to-day, and water and land alike alive with trade and travel. 'The deep ruts on the hard basalt Roman ways, even those remotest from Rome, testify to this traffic'. In the North and West of the Empire there was less vigour than in the nineteenth century : in the South and East very much more.

And also the Empire gave two and a half centuries of peace, only occasionally and locally interrupted ; a condition since unrealized. Contemporaries acknowledged these boons of peace, and security and regularity of intercourse. An inscription at Halicarnassus celebrates Augustus as 'the saviour of humanity, whose Providence fulfilled and outbid the prayers of all men : land and sea are at peace, and cities flourish in lawful government, unity and prosperity in all things'. All provinces at all periods raise this paean to the world-peace. The accession of the Caesars to the sovereignty of the earth had stripped Envy of his destructive

power, banned all baleful influences into the farthest deserts, and concentrated all the kindly genii from land and sea within the confines of the Empire. As the shape of the earth had set a term to the anarchy of conflicting atoms, Rome had similarly stayed the endless confusions of incessant warring states; she had united peoples and dynasties into one organization of peace, one unbreakable ring. In the first two centuries after the death of the first Caesars the imperial revenue rose rapidly, and peace secured prosperity. Hill and dale were cultivated; the mercantile marine increased, and trade between all countries. Nowhere were there wars or battles or bandits or pirates. This was the majesty of the *pax Romana*, which made Rome a sacred home, an eternal source of life, a secure anchorage: as though the gods had renewed the life of the world; all peoples prayed for the eternity of this gift of Rome.

More enthusiastic even than these utterances of Philo of Alexandria, Appian of Alexandria, Plutarch of Chaeronea, and Epictetus of Hierapolis in Phrygia, or Pliny, was Aristides of Smyrna in his eulogium on the first Antonine and the world-state. 'Could not every man go whither he would, without fear? Are not all harbours busy, are not mountains as safe as cities? Is there not the same charm in all fields, whence Dread has vanished? There are no streams impassable, no locked gulfs. The earth is no longer iron, but clad anew for a feast. Hellenes and barbarians may wander from their own homes to arrive at their own homes; the Cilician Gates, the narrow sandy roads to Egypt through Arabia present no terrors of mountain pass, torrents or savages: to be the Emperor's subject, to be a Roman is the one talisman. Homer had said, "The earth is common to all"; it was now realized. You have measured the earth, bridged the rivers, and made roads through the mountains, peopled the deserts, and ennobled all things. The world need be no more described; no laws or customs retailed; for you have been the leaders for every one, have opened every gate and given every man his freedom, to see all with his own eyes. You have conferred equal laws on all, and repealed conditions entertaining to the mind, and intolerable in reality; and merged all nations into one family.' The speech closes with a prayer 'that this city

and empire flourish eternally, or until iron float in the water, and no blossoms bloom in the spring.'

The Christians, too, with all their hostility to civilization, did not fail to appreciate its material advantages. Tertullian, writing about 290 A.D., says 'the world is more cultivated and richer than before. Every place is accessible and busy. Smiling fields have replaced deserts, and corn-fields the forests; lambs have driven away the wolves, and the sand has been made fertile, rocks broken, swamps drained: there are as many cities as there once were hovels. The islands are not barren nor the cliffs terrifying: every nook teems with ordered life'. Tertullian even thought that overpopulation was a coming evil, and plagues and famines a necessary remedy.

Yet eulogy, if ever justified, was deserved by the Roman system of communications, with its web of roads in and round the entire Empire, 'the glorious traces of which, in remote deserts, buried under graves and brambles, in the Sierra Morena or the Eifel, Scotland or Transylvania, on the Euphrates or the great Syrtes in Africa, monumentally recall to the wayfarer the greatness of Rome'. 'This elaborate network of roads increased public security, made agriculture more secure, facilitated touring and commerce, eased the working of the administration, made settlements possible, and quickened the spread of culture.' The ruin of these ancient universal links, the loss of the idea even of such a complete system, explain many misconceptions of Roman civilization, such as the rarity of travelling in the later Empire.

Naturally not all the Roman roads, or even the majority, were comparable with the oldest and most famous one, the Via Appia (built by Appius Claudius 312 B.C., from Rome to Capua). This 'queen of roads' in the sixth century aroused the wonder of Procopius, the Byzantine historian, who calls it a sight not to be missed. This was broad enough for two carriages to pass at breast and built of a stone not found in the neighbourhood and used for mills. The smooth, sharp-hewn blocks fitted together to a nicety, uncemented and unmetalled. Despite the traffic of centuries, the surface was unbroken, even preserving its first polish. To this day some stretches of exposed pavement of basalt polygons still hold firm. The mile between Beneventum and Aeclanum,

built under Hadrian, cost 100,000 sesterces (£1,087 10s.).

Procopius shows that this breadth was unusual. The Appian Way was, on the average, between twenty feet to fourteen feet: most roads were smaller. People then rode for the most part, or had two-horsed carriages, and a small track would be sufficient. In the fifteenth and sixteenth centuries, Italians regarded roads 'as broad as a coach' as an improvement; such were built by Philibert Emanuel of Savoy, Cosimo de' Medici and Gregory XIII. The traffic on the narrow Roman roads can never have been as great as that on the roads of Central Europe of to-day.

The construction of the Via Appia, defying time, no less than its breadth may have distinguished it from the rest. A great length of it was not plastered, but only gravelled over.

The great system of roads started from Rome with five principal radii. The first, to the South, went on the Via Appia to Capua, thence, by Forum Populi and Thurii, to Ad Columnam (ad Traiectum) whence the passage to Messina took one hour. Hence a road along the North coast of Sicily went by Panormus to the busy haven of Lilybaeum (near Marsala, about forty miles), whence boats ran to Carthage; the voyage of over 1,100 stadia taking twenty-four hours or more. In good weather sailings were made from Portus Augusti at the mouth of the Tiber, or Puteoli to Carthage. Carthage was linked on to Tingi (Tangiers) by a Western road, whence a ferry sailed to Belone (Bologna) in Spain, a voyage of 220 stadia, about four hours; and by an Eastern road to Alexandria, whence there was a connection with Asia over the isthmus of Suez on the main road to Antioch. From Alexandria, there was the Nile and two roads on either bank, running up to Hiera-Sykaminos, the frontier of Aethiopia. On the right bank Coptos was an important junction, whence roads started to the two harbours on the Red Sea for Indian and Arabian commerce, Myoshormos and Berenice.

The great road to the East also ran along the Appian Way to Capua, whence two roads bifurcated to Brundisium. The voyage to Dyrrhachium or Aulona (800 stadia) lasted twenty-four hours. From Dyrrhachium, the great Via Egnatia went straight through Macedonia and Thrace to Constantinople (c. 500 miles); at that point two roads branched off,

crossing North Greece on the West and the East, and meeting at Athens. In Thrace a by-road from the Via Egnatia led to Gallipoli on the Thracian Chersonese. From Gallipoli the crossing over the Hellespont to Lampsacus (sixty stadia) lasted about one hour. From Lampsacus the road traversed industrial Asia and its seats of ancient civilization, to Antioch (c. 600 miles from Constantinople); and from Antioch roads diverged East to the Euphrates and South to Syria and Palestine, 'in a then prosperous and populous country of famous towns', and thence over the isthmus of Suez to Alexandria, where it met the East African main road.

With the North there were three lines. The Via Flaminia (the modern Corso, crossing the Tiber at Ponte Molle) went by Narni and Spoleto to Rimini, whence the Via Aemilia went by Bologna, Modena, Parma, Piacenza to Milan (87 geographical miles). At Modena a road diverged, which at Verona met the road north of the Po and running parallel with it from Milan to Aquileia, by Bergamo, Brescia, Verona and Vicenza. Generally fast traffic went from Rimini along the coast to Ravenna, thence by water over the Seven Lakes, the lagoons of the Po, to Altinum, a staple-town for Italian commerce with the North: of this once prosperous city a few remains can be seen under the water of the lagoons near Venice. From Altinum, it went to Aquileia, the centre of Italian trade with the Danube. From Aquileia roads in Istria led to Pola, and through Dalmatia to Dyrrhachium; thence North-West through the Carnian Alps to Vipitenum (Sterzing am Wipthal), where this road met the one from Verona to Veldidena (Wilten near Innsbruck), and to Augsburg; and thence, North-East by Emona (Laibach), Poetovio (Pettau), Sabaria (Stein am Anger), Scarabantia (Ödenburg), to Carnuntum on the Danube, where the March flows into it at Hainburg. From this point, the road went up to the Danube to Vienna and Lauriacum (Lorch bei Enns) to Regina Castra (Regensburg), and down the Danube to Aquincum (Alt-Ofen). The great road from Aquileia to Constantinople went by Siscia (Sissek), Sirmium (Mitrovič), Serdika (Sophia), Philippopolis and Adrianople (1,128 Roman miles). From Constantinople there was a crossing over the Bosphorus to Chalcedonia, whence a main road went by Nicomedia, Nicaea, and Ancyra, with many branches into inner Little Asia.

The Via Aurelia, the second great road of Italy, ran along the West coast by Centum Cellae (Cività Vecchia), Pisa, Luna (East of Spezzia) to Genoa. Thence, as the Via Julia Augusta, it passed over the mountains, where the name of the Tropaea Augusti, erected after the subjection of the Alpine tribes 6 or 7 B.C., is preserved in Turbia; and so on to Nice, Marseilles and Arles, and Narbonne. From Narbonne there were two roads to Tarragona through the Col de Pertus (in the Pyrenees), and by Barcelona, or on the imperial road named and partly re-planned by Augustus through the pass of Puicerda, by Ilerda: this crossed the Ebro at Tortosa, and ended at Cadiz by the East and South coast.

Milan was the centre for Roman intercourse with the North and the West, by the Via Flaminia and the Via Aemilia. From Milan ran most of the Alpine roads, the building of which was the anxious care of Augustus after 15 B.C., and of his successors. The three main routes were over Mont Génèvre, the Great St. Bernhard and the Little St. Bernhard; the Mont Cenis was disregarded. Whether there was a Roman road over the Simplon is uncertain; if any road was built in the later Empire, it was only for local use. For the Gotthard 'the Schöllenen pass was impassable' until 1236. Of the Bündner passes the Romans used only the Julier and the Splügen: the way over the Splügen, perhaps only a mule-track, kept to the sunny heights of the left shore, and did not enter the dark Via Mala. In the Tyrol the oldest road (built 15 B.C.) led North from Trent, and the Claudian Way; later through the Reschenscheidegg: the first mention on inscriptions of the direct Brenner Pass is 195 A.D.

Of the Roman Alpine roads in the West (excluding those over the maritime Alps) the one built by Augustus 'with monumental bridges, hollowed-out ways and careful supports' over Mont Génèvre and the one over the Little St. Bernhard were passable: of the centre roads, the one over the Julier and Brenner, in the East the one over the Odra (Birnbaum-erwald): this was the lowest pass (520 metres), utilized in Strabo's times for the freighting of goods to Nauportus (Oberlaibach), whence they were shipped to the Danube; it also went by an equally low pass by Aquileia to Tarsatica near Fiume on the Gulf of Quarnero. But other passable

R.L.M.

T

Alpine roads there also were, such as that from Zuglio (Julium Carnicum) over the Pleckenpass into the Drauthal, still deeply rutted. In Strabo's time the Great St. Bernhard was still impossible for carriages: later there must have been a road; as in 69 A.D. legions crossed it even in the winter. In 47 A.D. this road and the Claudian Way through the Tyrol was built, and garnished with milestones. 'It is very doubtful whether the Alps were ever as much pierced and crossable at any time before the end of the nineteenth century, as they were under the Roman Empire.' The Roman engineers showed great circumspection. Of the road over the Julier, some pieces are in excellent preservation, accurately aligned, with big terminal stones and a roadway of nine to eleven feet. The gradient is never more than 15 per cent. The turnings are broad and made the road very usable.

Yet the wheeled-traffic over the Alps must have been very slight, as the roads were narrow (1.5 to 3.5 metres). Julian says that only one carriage and one mule-team could force their way through. They were also very steep: the ancient road up the Maloia Pass (1,811 metres) had three bends, the later one nine, and the modern one twenty-two. Except from May to September, when most of the passes were free from snow, passages across the Alps must have been difficult and dangerous. Ammianus describes men, animals and waggons slipping about in the spring on the road over Mont Génèvre in the snow-water, the carriages braked back by ropes pulled by the men and the animals. In the winter, it was all ice and snow; and stakes were put up to mark the road, and the abysses; and these signals might be snowed over or pulled down by torrents; guides had to be used. Greater dangers even, apart from avalanches, which often overwhelmed whole caravans, were involved in these narrow tracks, perilously on the edge of precipices, passable only by native men and animals, who were not giddy.

The busy road by Susa and Mont Génèvre was the shortest way from Milan to Arles (395 Roman miles); by Aosta and the Little St. Bernhard was the road to Vienna (308 Roman miles): the same road led to Strassburg (545 Roman miles) through Geneva and Besançon; from Aosta over the Great St. Bernhard, Martigny, Vévey, Basel-Augst to Strassburg, and so to Spiers, Worms and Mainz was 409

Roman miles ; or over the Splügen to Bregenz, and to Bâle or Augsburg ; or from Verona, over the Brenner, Wilten, Partenkirchen to Augsburg. From Augsburg roads went on to Regensburg, East to Lorch bei Enns, and there met the Vienna road, and West to the Neckar ; from Mainz to Trèves and Cologne, Nijmegen, Utrecht and Leiden ; and West to Rheims. Rheims was connected with Lyons, the centre of South Gaul, and Orleans, the centre of West Gaul, and also with Paris and Rouen ; as Lyons was with Strassburg and Bordeaux, where the Western Pyrenaean roads converged. The great road to Britain went by Rheims, Soissons, Amiens to Boulogne (Portus Gesoriacum) and the crossing was to Richborough (Rutupiae), lasting eight or nine hours for the 450 stadia. Britain, as a Roman province, had its network of roads, the principal points of which were Camulodunum (Colchester), London, and Eboracum (York), all interconnected with themselves and the ports, and extending as far as the Wall of Hadrian, the Northern frontier of the Empire.

A probable estimate of the total lengths of the road-system (as far as our knowledge allows) has not been made out. The pilgrim-route of 333 A.D. from Bordeaux by Arles, Milan, Aquileia, Constantinople, Nicomedia, Ancyra, Tarsus, Antioch, Tyre, Caesarea, Jerusalem, is about 680 geographical miles. A journey from Hadrian's Wall to the Aethiopian frontier (Hiera-sykaminos) would be about 1,000 miles. A tour from Alexandria to Leptis, Carthage, Caesarea, Cadiz, Cordova, Barcelona, Lyons, Rheims, Boulogne, Dover, London, the Scottish frontier, and back by Dover, Leiden, Cologne, Mainz, Strassburg, Milan, Verona, Aquileia, Sofia, Constantinople, Nicomedia, Ancyra, Antioch and Alexandria would be about 1,824 miles.

A comparison of the system of roads in the Mediterranean lands, and on the Lower Danube, in the later Roman Empire, with conditions at the beginning of the nineteenth century, would be unfavourable to modern times. The greatest retrogression in civilization, and in roads, is still to be seen in the huge realms under the barbarous sway of Islam.

In Africa there was one long coast-road from Tangiers (Tingi) by Carthage to Alexandria. Eastern Mauretania had a close network of roads centring at Sitifis (Setif) ; as

also Numidia, at Cirta (Constantine) in the North-West, and Theveste (Tebessa) in the South-East; and Proconsular Africa, in which the main roads met at Carthage, Hadrumetum (Susa) and Thenae (Tine). In both latter provinces, the roads stretched far inland. In Numidia the Djebel Aurès was surrounded by roads, connecting it with its lower heights on the North at Lambaesis (Lambessa), by Bescera (Biskra) and the oases. General St. Arnaud in 1850, when he passed the defile of Kanga, pronounced impassable by the natives, thought he was the first pioneer. But an inscription in the middle of the pass showed him that in 145 A.D., a division of the third legion was quartered here. On the way to the Oasis of El Kantara, the torrential Wadi Brenis is still crossed by a Roman bridge. These roads were mostly designed by the Emperors of the third century, and executed by the soldiers; that from Theveste to Carthage of 19,174 Roman miles was constructed in 123. Other roads were often laid out by the smaller towns even. Forts were put up at intervals for public security. In Tunis, under the French Protectorate, there were only mule-paths, excepting for three or four short roads: Morocco has no roads as yet.

In Egypt, and Asiatic and European Turkey, the main roads were from Sirmium (Mitrovič) to Singidunum (Belgrade) and Serdica (Sofia) to Constantinople (712 Roman miles). In the wilder parts their remains are still visible; near the great cities and populous parts, they are used for building purposes, called 'Latin Way' near Nish (Naissus), and 'Trajan's Way' near Sofia and elsewhere. The inhabitants of Ichtiman have a fable that the plastered road was laid down in ancient times for a princess, who might not betread the bare ground. The road between Philippopolis and Adrianople was still used by the Crusaders at the end of the twelfth century. On the Roman road depicted on Peutinger's map from Philippopolis over the middle of the Haemus to Novae (Svistov) the road can still be traced.

Greece in 1833 had no carriage-roads at all. In antiquity she could afford to neglect her roads (as she also did her drains and water supply), as the coasting-vessels compensated the lack. But to the Romans she owed her two great Northern roads: Hadrian linked these with the Peloponnese with a carriage-road from the dangerous mule-path by the

Sciron cliffs (a great engineering feat, wonderful even to-day). Further, in this barren province, even the Emperors did but little in road-building.

In Italy, too, at any rate in the South, such a complete system of roads, as existed in antiquity, was not revived for long afterwards. In the nineteenth century, the former kingdom of Naples scarcely had any, and practically no bridges: in the Basilicata in 1846 the King of Naples lost himself on a military promenade with many thousands of his adherents, and vanished for fourteen days. Sicily in 1872 had '09 kilometers of roads to the square kilometer; to this day, travelling inland is difficult, and the devastating *fumari* (unknown to Roman times) make long détours necessary. But, under the Empire, there were over one thousand Roman miles of roads, linking all the coast-towns, and Agrigentum with Panormus, and Syracuse with Catana, and Termini with Panormus. In Sardinia, where a guide must now be had, there were 1,000 miles of road: in Corsica, where Rome only held the East coast, 100.

In Spain there were side-roads in all directions from the main road by the East and South coast from Barcelona to Cadiz. In the South Seville and Cordova, in the North Saragossa and Astorga, in the West Merida were the principal centres. From Merida, as to this day, the principal connection with Lusitania and Lisbon was by Badajoz, Coimbra and Braga. A splendid Roman road, near Calzada de Oropesa (a part of the road from Toledo to Merida) aroused the admiration of J. G. Rist in 1806, as being in strange contrast with the prevailing desolation, with its solidity that pointed to happier days. 'Spain in 1830 had only the main roads from Madrid to Bayonne, Saragossa, Barcelona, Valencia, Seville and Lisbon, and a few provincial roads, from Valencia by Barcelona to Perpignan, from Burgos to Valladolid; these were possible for carriages: all else was a wilderness. From Madrid to Toledo, the largest town in a twenty-five-mile radius, there was a service of conveyances, that went, as they best could, in open fields.'

The large volume of traffic in the Empire must have made maps and lists of stopping-places an absolute need. A chance discovery of 1852 shows how common they must have been. On the floor of the Baths of Vicarello on the

Lago di Bracciano, four silver vessels were found, shaped like milestones, engraved with the full itinerary from Gades to Rome. These vessels, of different ages, must have belonged to Spaniards, taking a cure at these waters, and leaving these as pious offerings. The different dates of them imply a continuous manufacture, and Spain can hardly have been exceptional in this respect. And goldsmiths and silver-smiths would hardly have engraved their jars in this fashion, but for a great demand. Possibly these lists were often guides to the sights and historic interests, a kind of ancient Baedeker. The Pilgrim-guide of 333 A.D., from Bordeaux to Jerusalem, gives a very complete Biblical history referable to the several places, and historical, natural and general notes, especially for the neighbourhood of Jerusalem: e.g. at Bordeaux that the ebb and flow of the Garonne was visible from about 100 leagues; or of Viminacium, that Diocletian there killed Carinus; or at Libissa (Djebize) near Nicomedia in Bithynia, that it was there that Annibalianus, the African King, was buried; or at Andavilis, near Tyana, that race-horses were bred there: of Tyana again, that Apollonius the magician was born there: Pella is mentioned as the birthplace of Alexander the Great: and of the halting-place of Euripides, that the poet was buried there; and, lastly, of Caesarea in Palestine, that, three miles away, was a hill, Syna, with a spring, curing barrenness. And the *List of Halting-Places of Antoninus* (drawn up under Diocletian) contains much the same matter; it catalogues the Greek islands and connects with them the various legends of gods and heroes.

(ii) Augustus' institution of a State post was only intended for government business. It was carried on by military couriers: imperial messengers had their route mapped out into *mutationes* (changes of horses) and *mansiones* (night-quarters). Distances were reckoned by *mansiones* (about 25 Roman miles apart): one inscription, found at Asolo near Treviso, makes a widow travel fifty *mansiones* from Gaul to visit her husband's grave; as from Bordeaux to Aquileia was about forty *mansiones*, she must have come from North or North-West Gaul. At the *mansiones palatia* or *praetoria* were afterwards built for the use of governors or emperors. Private individuals might be allowed the use of the State

Post by *diplomata*, granted at first by the *procurator*, later, only under severe restrictions, by the Emperors. The expenses fell on the localities at first, without any relief. Nerva released Italy from the burden, and Septimius Severus charged the Post to the fisc; Hadrian having already made it a State institution. But it was a severe obligation for the provincials, to the last. Part of Hadrian's reforms was the replacement of freedmen by knights as superintendents of the Post at Rome, with a salary of 100,000 sesterces (*prae-fecti vehiculorum*); district surveyors received 60,000, but were first appointed by Septimius Severus. In the fourth and fifth centuries there were three grades of postal service. Despatches were carried by couriers, who led a second horse besides riding their own. Persons were conveyed by express carriages (*redae*), drawn by horses or mules: transports of war materials and goods on ox-waggons. River-boats and mail-packets also lay ready to expedite letters and persons. From an inscription it is known that a freedman of Hadrian was *procurator* of letters by the post-ships stationed at Ostia (*naves vagae*).

This State Post, like so much else in the Roman Empire, was copied from Persia, and hardly used at all for private purposes. But the success of these regular public services could hardly fail to incite private individuals, at least, when the demand was urgent, in the larger towns, and on the main roads. Traces of these private posts have been preserved in Italy. Jobbers of four-wheeled and two-wheeled carriages (*redae, cisiarii*) and draught-animals (*jumentarii*) formed guilds in several cities of Italy, which often combined: as in Tibur, the guild of the *jumentarii* with that of the *cisiarii* (named after Hercules, who was adored at Tibur). In Praeneste the guild of the *cisiarii* was formed in Republican times. Travellers mostly used *cisiarii* (such as were the *sedie* used in Italy throughout the eighteenth century): *redae*, a sign of greater wealth, were often, as a writer of the fourth century remarks, liable to accidents. In a parody of Catullus, ascribed to Virgil, one Vetturinus Sabinus, 'most sung of mule-drivers', is bemocked for boasting that 'no noisy cart could beat him on the road to Mantua or Brixia: not even his rival, Trypho, could deny this'. Caligula, during his stay in Gaul, sold all his imperial furniture, and took

over all the carriages on hire to fetch it from Rome. Many men thus could not attend the courts and lost their suits. Guilds of *jumentarii* are found in Mediolanium, Ariminum, Forum Sempronii (Fossombrone), Tudur (Todi): of *cisiarii* at Praeneste, Cales and Pompeii, and of both at Tibur: it is probable, therefore, they were general in Italy and the main provincial towns. As in the towns there was no driving, their occupations must have been the forwarding of travellers. Their ranks were at the gates: in the larger cities, there must have been several guilds, stationed at the gates and in the principal streets. Thus at Mediolanium, the guild of the *Vetturini* had its place at the Portus Jovis and the Portus Vercellinus; in Forum Sempronii at the Gallic Gate (the road to Senogallia), in Cales at the Stellatina Gate. They could either change carriage and horse from station to station, or, like their modern successors, use the same carriage continuously. These last were called *muliones perpetuarii*. Seneca in his pasquil on the death of Claudius compares Hercules, wandering through the world, with a *mulio perpetuarius*.

II. THE SPEED OF TRAVEL BY LAND AND SEA

The State Post on long journeys went five (Roman) miles an hour, including delays; from Antioch to Constantinople (747 miles) was about six days. Travellers on hired carriages counted this pace as very rapid, as the bargainings at the different stations lost them time. Caesar, whose speed was extraordinary, travelled from the Rhône to Rome in eight days. By the list of stations, from Rome to Arles through Toscana and the Maritime Alps was 796 miles; Suetonius must intend this journey in speaking of Caesar's rapidity in traversing 100 miles in a hired wagon in twenty-four hours. Swifter somewhat than Caesar was the messenger who bore news of the murder of Sextus Roscius to Ameria, fifty-six miles, on a two-wheeled carriage in ten hours by night; but this short stretch only required two changes of horses. Icelus brought news of Nero's murder to Galba in Spain, travelling in June, 68, from Rome to Clunia in under seven days; an extraordinary performance. The voyage from Ostia to Tarraco at the best took five days (Pliny the Elder

counts four days as the shortest passage known between Spain, probably Tarraco to Ostia) ; and there was the distance from Ostia to Rome. As Icelus arrived before sundown of the seventh day, he must have made the 332 miles between Tarraco and Clunia in under thirty-six hours. Cervantes considers twelve days from Naples to Barcelona fortunately little. From Barcelona to Toledo was made in six days on post-horses. The courier who rode with the news of the murder of Maximinus from Aquileia to Rome went yet faster : with changes of horses, he arrived in four days ; if he went entirely by land, he must have ridden 130 to 140 miles a day. Vitellius at Cologne received in the night of the 1st and 2nd January, 69, the news of the insurrection at Mainz of the 4th and 22nd legions against Galba : the messenger ran 108 Roman miles in twenty-four hours, or one geographical mile in thirty-five to thirty-eight minutes. The report of the procurator of Belgica on this revolt reached Rome before the 10th January. The couriers had then travelled from Mainz to Rome (by Rheims, the procuratorial residence), 1,440 miles in all, in less than nine days, or 160 miles per twenty-four hours. The swiftest journey known is that of Tiberius to Drusus from Ticinum (Pavia) into Germany, through the country of the Chatti, just subdued : he covered 200 miles with only a guide and several changes in twenty-four hours. Statius says that Baiae could be reached from Rome in a day on Domitian's road (built A.D. 95) by Sinuessa, but only a courier could have covered 141 miles in fourteen hours. Ordinary travellers would stay overnight and be three or four times as long. The carrier of a letter to Cicero took less than ten days from Dyrrhachium to Rome ; the 360 miles from Brundisium eight to nine. A comfortable time to Brundisium would be ten days, and from Tarraco to Bilbilis (224 miles) five. Rutilius Lupus, Cicero's friend, reached Rome from Mutina in six days, a distance of 317 miles. News of the Battle of Forum Gallorum (between Mutina and Bononia) on the 15th April, 43 B.C., reached Rome on the 21st. Hence, it seems, travellers with *vetturini* did forty to fifty miles a day. According to Procopius, walkers did 210 stadia or twenty-six or twenty-seven miles a day, the distance from Athens to Megara, a standard for Procopius' many itineraries on foot. Thus he estimates five days from Rome to Capua (124 or 136 miles). Longer

distances were covered in shorter times : Damis, in Philostratus, goes from Rome to Puteoli in three days (141 miles). Cicero at his Pompeian villa received letters from Rome in four or five days, at most in three : the messengers must have gone on foot. Short journeys on foot of twenty miles were readily undertaken by people involved in legal actions. Probably walking was as usual as driving. In the sixteenth century, in spite of the many roads built by Gregory XIII, Cosimo and Emanuel Philibert, 'as wide as a coach', carriages were seldom used, until the end of the century. In ancient Italy, waterways were also available. From Placentia by boat on the Po to Ravenna took about forty-eight hours.

Sea-voyages were limited to the spring, the summer and the early autumn. In the late autumn, ships came home or harboured abroad. From the 11th November to the 5th March there was no sailing ; on that day, by the reformed calendar, the feast of the 'ship of Isis' (the patroness of sailors) was celebrated all along the Mediterranean coast, with solemn processions, the consecration of a ship, and its sailing abroad. Then all the ships, drawn up on to land, were trolleyed out. No one, except in urgency, risked a winter voyage, though the sea was not absolutely uncrossable ; for avarice made men continue to court the sea in winter, as of old, when fear of pirates drove them to it. But, apart from mercantile enterprise, official transports of documents, legates or prisoners and relegates must have been considerable, even in the winter. Ovid had to embark for Tomi in a stormy December. Avilius Flaccus, the Praefect of Egypt, was, in the early winter of 37, brought as a prisoner to Rome, and had a bad passage. Cicero travelled in B.C. 50 from Actium to Brundisium from the 9th to the 25th of November, remaining at Corcyra till the 23rd, on account of the weather : many who had set out before were shipwrecked.

Coast-dwellers were overfond of practising the rights of wreckage, despite of the efforts of the Emperors (such as Hadrian, Antoninus Pius and Marcus Aurelius) : the inhabitants of the Cyclades were especially keen. They used to sell their victims as slaves ; a *dispensator* of Calvisius Sabinus (consul in 26 ; died 39) was shipwrecked, sold and branded as a slave. Manilius mentions divers for lost treasure : fishermen often set up false beacons to lure ships to their

doom. This was done on dangerous coasts, such as the Hollows of Euboea to the East by the promontory of Caphareus. Shipwrecked men were a large contingent of the beggars at Rome, and a class of the recipients of Christian alms.

Pirates, after the world-peace, scarcely existed in the Mediterranean, if ever, only in disturbed times; such as the Jewish War, when a number of fugitive Jews fortified at Joppa and made the seas between Syria, Phoenicia and Egypt insecure for a long time. In distant seas the Roman fleet could not quell the pirates, in the Indian Ocean or the North East of the Black Sea.

Voyages were made by preference on clear, starry nights. The steersman steered by the stars, to whom the passengers made worship before starting. Such voyages are often mentioned. Philostratus says that there was a regular evening service from Puteoli to Ostia, lasting three days, stopping probably in the mornings at Caieta and Antium (a populous port in Cicero's day). To Stabiae from Rome by sea took four days. From Brundisium to Corcyra or Dyrrhachium and back, in good weather, took a day, as did from Brundisium or Hydrus (Otranto) to Aulona (Valona). In 50 B.C. Cicero selected the route from Cassiope in Corcyra to Hydrus. From Rhegium to Puteoli, St. Paul sailed with a favouring South wind in one day; but in Philostratus, with a good wind, Apollonius and Damis took three days to go from Puteoli to Tauromenium through Messina. A regular route was from Sicily over the open sea to Cyllene in Elis: with very favourable conditions, Cyllene could be reached from Syracuse, or Corinth from Puteoli, in six or even five days.

In journeys from Italy to the Aegaeon, Attica and Little Asia, travellers landed at Lechaeon crossed the isthmus on foot or in carriages, and embarked at Cenchreae. Nero's canal through the isthmus—he selected the best line, the one opened in 1893—was only partly completed. Herodes Atticus also intended a similar venture.

Propertius thought of crossing the isthmus by land; and Ovid, on his way to Tomi, did so, and bought or hired a new ship *Minerva* at Cenchreae. Avilius Flaccus was also forwarded to his island of relegation, Andros, in the same way. Galen returned from Rome to Little Asia with a friend

from Gortyn by way of Corinth : the friend sent his slaves and his luggage by water to Athens, and hired a carriage, and, with a few slaves, made his way there by land through Megara. Aristides made his return journey in September, 145, from Rome by sea. The ship had a bad passage from the start : at the North-East of Sicily, Peloris, was driven to land, and was tossed about in the straits of Messina : in two nights and one day they got out into the Adriatic and into a quiet sea, but only landed at Cephallenia with difficulty. Then, against Aristides' advice, they sailed from Patrae at the equinox, and the journey was stormy. They crossed the Isthmus by land, reached Miletus in four days : fourteen days in all. The Peloponnese was often circumnavigated, as an inscription of a merchant, Flavius Zeuxis, at Hierapolis in Phrygia, shows : he had shipped from the Peloponnese to Italy seventy-two times : it was notoriously dangerous. In September, 111 A.D., Pliny the Younger came back that way, as he writes to Trajan from Ephesus. Thence he was going to travel to Bithynia along the coast, partly by sea, on account of the heat, and partly by carriage, because of the contrary winds.

A voyager, desirous of avoiding the sea from Italy to Asia, might go by land through Thrace and Macedonia (on the Via Egnatia from Apollonia in Greek Illyria to the Hebrus in Thrace), as many did. Galen's second journey to Rome and back was along this route. On his way to Rome he wanted to call at Lemnos and availed himself of a ship sailing from Alexandria Troas to Thessalonica : but under the misapprehension that Lemnos, like the rest of the Aegaeon islands, had but a single city, he landed at Myrina, on the West coast, instead of Hephaestias on the East, where he could have seen fuller's earth in preparation. The captain could not wait for him ; so he postponed the visit until his return : he then, from Philippi in Macedonia, crossed the 120 stadia of sea to the other coast, went to Thasos (200 stadia), Lemnos (700) and Alexandria Troas (700). Aristides, in 144 A.D., made his way back to Rome by the Via Egnatia. Rain-storms beset him, and frost and snow and tempests. The Hebrus was frozen over, the ice broken to make passage-room for boats ; the fields flooded in all directions ; inns were few, and their rooms gave forth more water than the heavens.

Yet he travelled faster than the imperial messengers. Most of his slaves followed slowly after. He found his own guides, where necessary: no easy task, for they fled like savages at his approach, and had to be coaxed or forced. In Edessa he fell ill, and in one hundred days had reached Rome. A part of his beasts of draught died on the way; the rest he sold. The records of St. Ignatius the Martyr mention his starting in the late autumn or winter from Seleucia by sea to Smyrna and Troas; thence, by land through Macedonia to Epidamnus, and thence by sea to Ostia: the account, if false, is based on probabilities. Ovid went from Corinth to Samothrace, whence, as he says in an elegy, it was a mere step to Tentyra (near Trajanopolis). Hence he wished to reach Tomi by land via Thrace and Moesia, whilst his *Minerva* sailed along the Hellespont and the coast of the Black Sea. How long he was on the way is not known: in an epistle he says a letter from or to Rome took six months: this is no standard. The news of the death of Gaius Caesar at Limyra in Lycia on the 21st February, 4 A.D., reached Pisa on the 2nd April.

From Lake Maeotis merchantships with good winds reached Rhodes in ten days; thence, it was four days to Alexandria, and ten days down the Nile to Aethiopia: as Diodorus says, in twenty-four days one could sail from the coldest to the hottest zones. Galerius the Praefect reached Alexandria on the seventh day after leaving the Sicilian Straits: Valerius Maximus, a praetorian senator, went from Puteoli in nine days. In the monsoon season, travellers to Syria from Italy preferred the route over Alexandria to the direct one from Brundisium, a long and difficult journey: especially as Alexandrian ships had the reputation of being swiftest and best-steered; it was thus that Agrippa, King of the Jews, travelled at Caligula's suggestion. Yet to make the sea journey even shorter, Alexandria might be reached circuitously through Greece, Little Asia and Syria. In a charter of a ship, 200 days is required for a voyage from Berytus to Brundisium and back. This includes the long and frequent stoppages of a merchantship. A letter from Cassius to Cicero, sent from near Apamea in Syria, reached Rome in less than fifty days; but one from Antistius Vetus to Balbus took 100 days from Syria. A letter from the Tyrian factory in Puteoli, sent on the 23rd July, 174, reached Tyre on the 8th December, in

107 days. Cicero's son at Athens received a letter from his father forty-six days after it was sent: another took only twenty-one days, which was considered very little. A letter of Tiro to Cicero from Patrae reached Brundisium in fifteen days: letters from Britain in twenty-three twenty-seven or twenty-nine, from Africa in twenty-two, although Cato the Elder, as is known, showed in the Senate a fig plucked three days before at Carthage. The news of the battle of Munda (N.E. of Malaga), on the 17th March, 45 B.C., reached Rome only on the 20th April. Pliny gives a few figures of quick passages to some of the Western Mediterranean ports. Ostia to Gades took seven days; Tarraco to Ostia four; Narbonese Gaul (Forum Julii) three; Africa two, even in mild weather: Alexandria to Marseilles in merchantmen took thirty days. To reach Utica from Narbo in five days, and Alexandria in seven, was a fast voyage.

Ships occasionally had contrivances for measuring their mileage, and Vitruvius describes them. There is material enough to estimate the average sailing-speed. Marcian of Heraclea, the geographer, remarks that these sea-distances (in *stadia*) were very diverse; it was best to draw a mean between the highest and the lowest. A ship with a good wind might do 700 *stadia* a day; a swift cruiser even 900. Scylax of Caryanda makes 500 a day the average, on a long journey. The night-time is not included, for Herodotus and others expressly say that, at midsummer, a ship could do 700 *stadia* by day and 600 by night. A voyage from the mouth of the Phasis to the West coast of the Black Sea direct took nine days and eight nights; a distance of 11,100 *stadia*. According to Aristides, a ship under a strong wind could in twenty-four hours do 1,200 *stadia*, as he could testify. From the time of Herodotus to that of Marcian (400 A.D.) speed remained the same, between 1,000 and 1,500 *stadia* (25-37½ geographical miles, or 100-150 sea-miles) in twenty-four hours; or $\frac{1}{24}$ - $1\frac{1}{24}$ geographical miles per hour. This accords with all the facts of early and late antiquity. According to Diodorus the journey from the Pityusae to Gibraltar took three days and nights; to the African coast twenty-four hours, to the Spanish coast one day; from Majorca to Spain, a day. Strabo mentions the distance from the promontory *Κριὸν Μέτρωπον* in Crete, according to Eratosthenes

as 2,000 *stadia*, or two days and two nights. From Samonium, (the N.E. point of Crete) to Egypt was three or four days and nights, eighty miles (according to Strabo 5,000 *stadia*). From the Caletii at the mouth of the Seine to Britain was one day. In voyages on the East African coast, South of Cape Guardafui, the veering winds made only 400 or 500 *stadia* a day possible. Pliny's record voyages are at the most 140 sea-miles to twenty-four hours, or six an hour: the same pace as that of the *Novara*, on its sail from Valparaiso to the Atlantic equator.

III. LAND JOURNEYS

The methods of travelling are occasionally mentioned. Simple wayfarers walked with their mantle pinned up, or with modest baggage bestrode a mule or a horse; but the poorer even seldom without one slave at least. If the traveller drove, the slaves followed in a second carriage, at all events on longer journeys. Seneca once was seized with an impulse to make a poor man's journey. He and a friend, Caesonius Maximus, carrying all their luggage on them, went with so few attendants that one extra carriage was sufficient. They rested on the bare earth, a mattress under them, and one rain-mantle as sheet and one as coverlet. Their meals were of the simplest, and were made ready in less than one hour: dried figs were invariable, and their tablets always at hand to note down impressions. He drove in a peasant's waggon, his mules just moving along, the man guiding them barefoot, not because it was summer, but as his habit. These two days of Arcady had taught him how superfluous much of ordinary life was. Yet an uneasy envy overtook him, at the sight of a gorgeous equipage; he was ashamed that so poor a vehicle should be thought his. These feelings are explicable in this millionaire and consular: for senators and knights to travel without retinue and piles of baggage was unique: this luxury obtained even under the Republic. On a journey to Lanuvium with his wife, Milo took all his singing boys, besides his slaves, male and female. Caesar, on his campaigns, carried mosaic floors with him: Antony's journeys were

like a travelling circus, with his huge coach, the carriage drawn by lions, and the ostentation of gold.

This luxury was far exceeded under the Empire. Nero always had a suite of a thousand carriages; his mules had silver shoes, his muleteers scarlet liveries, his outriders and runners were gorgeously clad: Poppaea had her horses harnessed with gold, and had 500 asses with her, so as to bathe in their milk every day: in the retinue of Eusebia, the wife of Constantius (353), there were 'coaches of all sorts, inwrought with gold and silver and bronze'. The upper classes vied in imitating this luxury, as Seneca shows: many of these fashionable plutocrats were only rich on their journeys, and deliberated whether, after their insolvency, they should hire themselves out as gladiators or fighters with animals. Gaily-dressed Moors, Numidian outriders and runners cleared the way. Well-fed mules, if possible alike in colour, or the little fat but swift Gaulish horses, drew the waggons, and palfreys followed for riding. The beasts of burden were covered with gold or purple trappings, with golden bridles and bits: the travelling-carriages were filled with gold or silver figures, and might be worth many estates; curtains of silk or other rarities, plate of gold and crystal and myrrha; works of art, too delicate to be shaken, and carried; such was the pomp: and, of course, a huge court of love-boys, with masks to protect their faces, and so on. Rich provincials even travelled in this fashion. Polemo, the sophist of Smyrna, travelled with hundreds of beasts of burden, horses, slaves, leashes of hounds, and his own Phrygian or Gaulish horses with silver harness.

This inordinate luxury was always being adapted to useful purposes. To facilitate reading, instead of papyri, written on one side and held in both hands, compacter parchment books were used. Martial recommends the reader, to make his poems a real *vade mecum*, to purchase such a miniature parchment edition; for to have such a Cicero on a journey was almost the same as having the writer himself. One could also write: Pliny the Elder always took a shorthand writer with him, and to keep his hands warm in the winter, allowed him long sleeves. Sleeping-carriages there also were (*carruca dormitoria*): in the Pandects, the problem is raised, whether a legacy to a wife included the mules and the

sleeping-carriage. Claudius, a devotee to dice, had a suitable table put up in a travelling-carriage. Commodus had contrivance for flexible seats, to avoid the sun, or enjoy the breeze, and pedometers and horometers were also used.

Noble ladies generally travelled in palanquins. Antony, according to a letter of Cicero (49 B.C.), had his mistress Cytheris thus borne beside him, and seven other palanquins bore the seven mistresses of his friends. Julia, the daughter of Augustus and wife of Agrippa, was once at night on the way to Ilium, and was almost drowned with her carriers by a rising of the Scamander. Agrippa, furious at the neglect of her by the townsmen, fined them 100,000 *denarii*, though they had not been advised of her approach; but it was remitted at the intercession of King Herod, through Nicolaus of Damascus.

Slavery, and the lack of inns, account for these gorgeous and complete travelling arrangements. The rich man, with hundreds of slaves, could carry his palace with him everywhere, and some service had become habitual to him. Local inn-keepers could not cater for such luxurious tastes, especially as the warm Southern air made such shelter unnecessary. But there also were some good, or even high-class hotels, where the traveller might well stay on. Epictetus compares those who, instead of proceeding to their true home of philosophy, linger in the wayside resort of oratory, to a traveller who remains at a comfortable inn, and delays his journey home, and forgets his first object, losing himself in the many fine halfway houses. In populous commercial or pleasure cities or seaside resorts, there would be numerous good hotels, e.g. as Strabo says, at Berenice in Upper Egypt on the Red Sea, the staple market for India and Arabia. Strabo says that the inns on the canal at Canopus supply all the needs of the luxury of the district, and mentions the one at Carura, on the frontier of Phrygia and Caria, where there were hot wells. But most inns were probably third-rate, but not because they catered for the poorer classes. They are even now inferior in the South, since the southerner is easily satisfied in the matter of lodging; which was perhaps the case even more in ancient times. But travellers who sought only a bed and a meal and shelter were well contented; and on such these inns thrive, for the number

R.L.M.

U

of people carrying tents and all their own conveniences with them must have been very small.

Officials, judges and their suite, and soldiers had quarters provided for them by house-owners, according to their positions, their leisure and their wealth : but Vespasian released philosophers, grammarians, rhetors and physicians from this burden. The man on whom these visitors were billeted had to put up with their rude behaviour. Pliny tells of the inhabitants of Hippo Diarrhytus in Africa, who killed a wonderful tame dolphin, to escape the officials who came to see it. When Cato of Utica was preparing to appoint provincial officials, he always sent his baker and his cook the morning before to select his quarters. They quietly entered the town, looked for some family friend ; and, if none were to be found, chose an inn, rather than burden a private individual ; were there no inn, they applied to the city council and cheerfully accepted the quarters assigned by them : but their calm and polite demeanour often brought them scant courtesy. Even great men could only have halting-places of their own sufficient for short journeys in Italy ; such as Cicero had at Anagnia, Atina, Frusino, Lanuvium, Sinuessa, and was negotiating for at Tarra-cina.

Hence, for the majority of travellers, there must have been inns in Italy and the provinces. A commercial traveller included hotel-bills, as well as fares in his expenses. Aristides the *rhetor*, on a journey from Smyrna to Pergamus, used inns, though he must have had many friends. He started on a summer noon, sent his luggage in advance, and about sunset reached an inn by the river Hermus ; but the rooms were insufferably hot, and he went on. Late at night he reached Larissa, and fared little better, and midnight found him at Cumae, where all was locked up. So he still travelled on, and at cockcrow arrived at Myrina, caught up his slaves, who were standing ready to start in front of one of the inns ; he tried to rest on a bed in the vestibule, obtained admission into a friend's house, and at daybreak journeyed on to Gryneum, rested at Elaea in another inn, and next day reached Pergamus. In traversing Thrace, an uncivilized and untravelled country, he must have had other difficulties besides the wintry season.

But even there there were inns. 'How glad', says Seneca, 'we are, at the sight of shelter in a desert, a roof in a storm, a bath, or a fire in the cold, and how dear they cost in inns'. Julius Caesar with his friend Gaius Oppius was crossing a forest: Oppius fell ill, and Caesar gave up to him the only little inn there was, and slept on the bare ground. The Good Samaritan had an inn near him. Towns invariably had many inns; even Bethlehem had one. Sometimes the communes undertook the service. At the Springs of Clitumnus, the town of Hispellum (Spello) was presented by Augustus with a piece of land, and erected a bath and an inn. Municipal enterprise often embraced hotels: such a *hospitium adventorium* was found by Gaius Arunceius Cotta in an unknown colony, together with a bath for slaves. In Calama, in North Africa, the *curator* of the town, about A.D. 400, converted a waste spot, at his own expense, into a civic hall and hotel.

In larger towns, there was a choice of inns. Plutarch warns travellers against false shame making them select the worse inn, or give ear to an importunate host. Land-owners of property adjoining a main road built inns, kept by their freedmen as agents; and this used to turn out profitable. The fisc, in wilder and more solitary parts, used to put such houses up. In 61 A.D. Nero ordered the *procurator* of Thrace to put up *praetoria* for the use of officials: in 136 A.D. Hadrian had his new road along the Red Sea amply fortified and provided. At such *stationes* there were inns, named after the station. The *Acts* mention the Station of the Three Inns, on the Via Appia, near the Pontine Marshes, a name given to a station on the road from Dyrrhachium to Byzantium; on the *Via Latina*, the third station from Rome was called 'To the Gay', an inn mentioned by Strabo. Several other stations were similarly named, either because they alone provided accommodation, or because they were attached to *mansiones* erected and maintained at the public expense: these, also, may, if there were room enough, have been available to ordinary travellers on terms.

The signs of inns were often animals, a camel (mentioned by Artemidorus), or an elephant led by a pygmy (an inn belonging to one Sittius at Pompeii), or the cock from Tarra-gona at Narbonne. A *Station* between Utica and Carthage

was called 'The Cock'; other names were 'The Great Eagle', 'The Little Eagle', 'The Snake', 'The Great Crane', 'The Sword', 'The Wheel', 'The Olives'. These tabards often promised friendly service, baths, and comforts; in Italy, often, 'after Roman fashion'; one favourite commercial hotel at Lyons, with Apollo and Mercury on its sign, runs: 'Here Mercury promises gain, Apollo health, Septumanus [the owner] meals and rooms. Any one coming in will be the better for it; stranger, look to where you stay'. At one inn at Antibes, we read: 'One word, wayfarer: come in: a copper-tablet [the tariff] tells you all'. The host or hostess greeted the travellers, and recommended their house. In a poem ascribed to Virgil, a Syrian hostess, with a Greek head-dress, is dancing drunkenly a castagnette-dance in front of her smoky tavern, and inviting the guest on his weary ass in, promising him the coolness of her shady arbour by the babbling brook, even at the season when the trees are humming with grasshoppers, and lizards flee the heat: she will give him a meal of cheese, yellow plums, mulberries, grapes, gourds, chestnuts and apples, wine of this year's vintage, wreaths of violets, roses, lilies and rural music: Ceres, Bacchus and Amor as well shall befriend the guest.

The ordinary inns (only of which mention is made) did not invite a long stay: the company was low, grooms and muleteers; Vitellius, before ascending the throne, affected affability and frequented them. Plutarch, as a means of health, recommends constant loud speaking, and says that the jeers of sailors, muleteers and hosts at inns should not deter. Apollinaris Sidonius' description of the interior of a 'greasy tavern' could easily be antedated. The smoke from the kitchen filled it, and oppressed incomers; on thyme-wreathed porringers the sausages could be smelt: the steam and clatter of pots and pans and chanting of the guests. The pillows, stuffed with reeds, instead of feathers, teemed with fleas and bugs; from the ceilings lizards and spiders would drop down. Prices might not be overhigh. In the days of Polybius, in the lowlands of Lombardy, inns were cheap: there were no bills, but an inclusive rate of half an *as* ($\frac{1}{2}d.$). A relief, dating from imperial times, at Aesernia in Samnium (Isernia), represents a man, in touring-costume, leading his mule,

bargaining with his hostess : the legend is that the bread is one *as* ($\frac{3}{4}d.$), dessert two *asses*, service two *asses*, hay two *asses*, wine free. The two *denarii* paid by the Good Samaritan for one day's expenses, must have been more than sufficient, as they were also meant to cover medical treatment. Possibly travellers (as to this day in Greek khans) brought their own food with them, to be cooked at the inn.

Further, inns were often brothels. Jurists are constantly mentioning that the servants at inns, in town or country, consisted of cheap girls, and that inn-keepers were unproffessed pandars. A rescript of Alexander Severus directed that a slave sold on condition of non-prostitution, might not be bought for such an inn. The law that there could be no adultery with barmaids, was made by Constantine in 326 not to apply to the hostess, provided she did not serve the guests herself.

As pandars and for other reasons, inn-keepers had an ill-repute. On the lists of the police-soldiers, they were inscribed with thieves and gamblers. They lied and cheated, adulterated the wine (Trimalchio says they were born under the Sign of Aquarius) and stole the oats provided for the mules. According to Artemidorus (a great traveller) to dream of bronze or iron foreheads was a good omen for publicans and toll-keepers ; thorns especially good for publicans, toll-keepers and robbers who gave false weights, and stole by force or craft. Galen says that human flesh tasted very much like pork, and was often dished up by unscrupulous publicans ; he had been credibly informed of a very palatable dish, in which a finger-bone was found : the travellers left in instant disgust, and the owners had subsequently been convicted of presence at a human slaughter-house. The land-ladies were often reputed witches, as once in Apuleius. St. Augustine says that they would put a Circean drug into their cheese, turning their guests into conscious mules, and restoring them only on conditions. And publicans were liable for loss suffered by guests in their houses.

Toll-keepers were proverbially dishonest ; perhaps largely in fact. Smuggling was common and conscientious officials even were obnoxious. 'We object to customs officials', says Plutarch, 'not when they examine open wares, but when they finger the insides of bags ; and yet this is their legal

duty'. Rhetorical mock-cases hardly accord with the facts. One of them ran: 'On all articles, except necessities for travel, there is a tax of $2\frac{1}{2}$ per cent. The official is entitled to examine the baggage, and confiscate all undeclared dutiable goods: he may not touch women. A woman had 400 large pearls in her bosom. The official asks about them. She says he may search her: he refuses, she passes the barrier, and he stops her and demands the pearls'. Soldiers' goods were toll-free, and this privilege might be granted by imperial favour. Trajan awarded it to Polemo the sophist of Smyrna, on land and sea, and Hadrian to his descendants.

Worse than the exactions of the tolls and the cheatings of the publicans was the frequent insecurity of travelling. The police force was partly in the hands of the communes. In the Western portion of the Empire, we find a city force (*praefectus arcendis latronibus*) at several places, such as Nyon (near Bingen): in the East the *Irenarchi*, who commanded the local militia of the *diognitiae*. Further, in all provinces, military posts were disposed by the central authority, under subalterns, up to the rank of centurions, and the governors were directed to make forays against breakers of the peace. But, says Cassius Dio, brigandage is as eternal as human nature.

Brigandage was worst in the frontier provinces. An inscription in Nether Pannonia (in the County of Stuhlweissenburg, Székes-féjervár) says that Commodus in 185 A.D. fortified all the banks of the Danube against robbers. In the tombs in Dacia, three (near Mehadja and Cernets) record the murder of two men and a woman by robbers; two were revenged. Monuments to persons killed by bandits have been found in Upper Moesia (at Orachovats), Darmstadt and Trèves. The roads in Africa, despite the castles, were often most insecure, as Cyprian, Bishop of Carthage, shows; he says that a report that an inn had been seized by robbers, made travellers avoid it. An engineer of the third legion stationed at Lambessa, summoned to build a tunnel to Saldæ (Bougie) in 152 A.D., says he fell on robbers on the way, and was stripped and wounded. Lucian mentions that there were many robbers in Egypt at the time of the Prophet Alexander of Abonuteichos. The Nile swamps near Damietta were the lurking-place of the *bucoli*, a savage people, known to Eratos-

thenes : the novel of Heliodorus describes their wild life on barks and islets. Under Marcus Aurelius, they threatened Alexandria, and Avidius Cassius could hardly subdue them. They gave trouble, later on, to the Khalifs.

Not only frontier provinces, but mountainous and half-civilized districts abounded in brigands. The monuments at Salona in Dalmatia record the murder of a ten-year-old girl for her jewels, and the seizure of a man. Spanish inscriptions mention two deaths at the hands of robbers. The Gospels show that Judaea was not scatheless for travellers. It is not known how far the Herods and the Romans succeeded in weaning from brigandage the population of the East Jordan land, the Hauran and the cavernous Trachones. The constancy of robbery in Little Asia, which is mountainous and a desert in its interior, is explicable by the smallness of the garrisons, except on the frontier. 'The Pamphyliaus', says Strabo, 'still practise robbery : the Mysian Olympus has huge oak forests and almost inexpugnable strongholds in them : in my time, Cleon, the robber, kept a band there'. Galen tells of a robber, who worked at Coracesion in Pamphylia, and used to cut off his victims' legs. Isauria became a highwaymen's country, after the third century : thenceforward, and under the Byzantines, it preyed on Southern Little Asia. An inscription mentions the conquest of robber bands on the Hellespont by Titus Valerius Proclus, an official of Drusus Caesar, the son of Germanicus. Under Hadrian, a brigand Tilloboras occupied Ida near Troy and made forays thence. Despite the exertions of Hadrian and his successors, the roads of Achaia and the adjoining countries were made insecure, and the fortunate brigand chieftain is one of Lucian's lower class types. The many tales of robbers in the romance of Apuleius in Lucian's time must have been borrowed from reality. In Sardinia, in Varro's time, most fertile districts could not be cultivated for fear of robbers, and 6 A.D. a formal war was declared against them : 19 A.D. Tiberius sent 4,000 freedmen, 'infected with Jewish and Egyptian superstitions', to fight them. According to Strabo the mountain-dwellers of Corsica lived on loot, and were more savage than wolves. Prudent travellers in unsafe districts would follow in the suite of high officials, ambassadors, quaestors, or proconsuls, or secure an escort :

Lucian got two lance-men as escort from his friend the governor of Cappadocia, to accompany him to the sea.

But even the most civilized and peaceful regions were sometimes harried. In 187 A.D., a deserter, Maternus, formed a band and terrorized the whole of Gaul and Spain, burning villages and farms, even attacking great cities, setting the criminal free, and ravaging at will. He evaded the troops of Commodus, and escaped to Italy, designing to murder the Emperor : he was betrayed and executed.

In Italy insecurity was greatest, after the civil wars : armed highwaymen appeared publicly and made a night-journey from Rome to Tibur perilous. Augustus erected forts at suitable places, but the evil was not altogether allayed, and Tiberius had to extend them. Highwaymen, when caught, were tortured to death, torn asunder by wild beasts ; their corpses hanged, as warnings and 'consolation to the victim's kin', at the spots of their evil trade (as was done in the Papal States up to 1819) ; they were left on the gallows or crucified, or, especially in mountainous districts, left by the roadside, as carrion for the birds, or the curious physician. Galen saw a skeleton of a robber, who had fallen at the hands of his intended victim : the inhabitants would not bury him ; and in two days, so much flesh had been torn away, as to make the remains very instructive. But, even in Italy, brigandage died hard, if at all. At night torches were used (and thrown away at daybreak : hedges were thus sometimes set on fire), and any bearer of valuables trembled at the shadows. Houses were also burgled ; Pliny the Elder tells how Caelius a senator lay sick at Placentia, was attacked by robbers and guarded by his dog. About 106/7 Pliny the Younger was ordered to inquire after a senatorial knight, all trace of whom had been lost near Otricoli : it was feared that he must have fared like a fellow-countryman who had set out with a sum of money to provide for his centurionate ; he and his slaves had utterly disappeared, possibly at their hands. Highwaymen sought not only booty, but also ransom, both in Italy and in the provinces : many a helpless wanderer vanished for ever into one of the huge *ergastula* of large landowners. In daytime even, armed bands drove off herds. Marcus Aurelius, in a letter of his boyhood to Fronto, tells of how he and his company

gave the impression of being robbers to some shepherds ; and how he spurred into the flock and was cudgelled for his pains. The Pontine Swamps and the long sandy Gallinarian Forest (the Pineta) were the most dreaded : Sextus Pompeius, during the war with the Triumvirate, organized robber-bands there. The various forays into them only dispersed the bandits temporarily, even into Rome.

Civil wars and unrest were not the only causes. Severus' raising of the Praetorian Guards out of non-Italian troops forced the martial youth of Italy to become gladiators or highwaymen. Towards the end of his reign, one bandit, Felix Bulla, harried all Italy, at the head of 600 comrades, and defended his position for two years stoutly. His cunning and his bribes ensured his not being seen, or found or arrested, despite the price put on his head. He learnt from all who were leaving Rome or landing at Brundisium, who they were and what they had : from most, he simply took a little : the artisans he detained awhile, paid them and released them. Two of his men were captured and condemned to the lions : he personated the chief district officer, who required men for his spectacles, and successfully obtained his own men back. A centurion was sent to capture him, and Bulla enticed him into an ambushade. On arrival, he revealed who he was, shaved the centurion's head, and sent him back with the message, that, if masters treated their slaves better, there would be no robbers. Many imperial slaves, badly paid or unpaid, were in his ranks. Severus made a last and vigorous effort, sent a tribune of the Imperial Guard with a large detachment of cavalry, to capture him at all costs, dead or alive : he was betrayed by a mistress, and caught asleep in a cave. Papinian the jurist had to try him and asked him why he was a bandit. He retorted : 'Why are you a praefect ?' He was torn asunder, to a herald's call, by wild beasts, and his band easily captured. For, says Dio, in him was the strength of the six hundred. Proculus in 280 A.D. was a claimant for the throne, a descendant of a great rich robber family near Albenga, on the Genoese Riviera, and commanding 2,000 armed slaves. Ghosts, lovers and robbers were the favourite themes of light literature, especially robbers : Apuleius extols the 'brave, steadfast, faithful robber of the better sort'. And, so great was

the interest in them, that Arrian wrote the biography of Tilloboras.

These many names of robbers throughout the entire Empire extend also through several whole centuries. Corresponding collections from European history for the last three centuries would furnish a longer list from the ampler material. Up to 1816 highwaymen made the road from London to Dover perilous ; in Western Germany there were great bandits, and Dick Turpins have furnished romances, and this is scarcely a century ago. We may then doubt whether even in the nineteenth century the regions round the Mediterranean and the Lower Danube were not, and are not now, more insecure than in Roman times, excepting Greece and Moslem countries altogether. In Hungary of to-day the roving good-fellow and robber Bélyár are still the subjects of popular legend and fancy. In 1852 Bismarck might not ride from Szólnók to Ketskémet without an escort, for the region was a hive of bandits, on the undrained and impenetrable swamps of the Theiss ; bands of fifteen to twenty, well armed and well mounted, attacked Court and commoner alike. At Szegedín in 1873 800 robbers and murderers were convicted and 1,500 accomplices on the lists. Out of a population of 157,000 in the district of Zara in Dalmatia, between 1851-1863, 2,659 trials for public violence were held, 1,919 persons maimed, and 507 murdered. In Verlikka one in twenty-one was a murderer. The history of the Italian Camorra and Mafia since 1799 would fill volumes ; nothing but the eradication of their causes can destroy them, despite the continual efforts since 1860. In Corsica in 1851 there were 200 bandits, and as many living in Sardinia, as refugees. Spain in 1830 was absolutely unsafe. All the chief posts, except those from Barcelona to Perpignan, had to purchase their liberty. The great busy road from Seville to Cadiz was impossible without a strong escort between San Lúcar and Puerto Santa Maria. No one, save in dire need, ventured on the road between Gibraltar and Cadiz ; yet on it, in the summer of 1830, thirty-five people were plundered in eight weeks. Even in some of the great cities life and property were insecure. In Seville, every night had its murder. In Malaga murderers were immune. Forty years later things were not bettered. In the winter of 1869 a little bathing town in the hills of

the South was assailed and sacked by bandits, and eighteen visitors killed. In 1842, seven years after the close of the Civil War in Portugal, in the kingdom of Algarbia, 100 *guerrilhas* or Miguelistas (really mere highwaymen) kept 3,000 of the regular army in check in the valleys of the Serra de Monchique. Cassius Dio's prophecy, that banditry will not cease as long as human nature remains the same, has been true for the South of Europe.

IV. THE NATURE OF THE TRAFFIC

§ 1. THE TRAFFIC OF THE ROMAN EMPIRE

What has been said as yet of Roman communications shows that the huge extent of the Empire involved ready and thorough linkage. Centralization of government and jurisdiction necessitated uninterrupted services between every province and its capital, and Rome. The governors were constantly corresponding with the Emperors, as Pliny's correspondence (as Consular legate of Bithynia 111-113) with Trajan proves, though he may have been exceptionally punctilious: procurators and imperial officials in the provinces were always in communication with departments at Rome, or the Emperor. Officials or ambassadors extraordinary were always starting, escorted from the moors of Scotland to the Atlas, from Syria to the frontier stations of Germany. 'Highly placed men', says Epictetus, 'and senators, cannot rest at home, but, in command, or under command, in war or civil or legal duty, must always be travelling'. The higher officials only gained their posts after many years of varied voyages. At all epochs very many provincials had to come to Rome personally to prosecute their claims. Martial mentions one journey to Rome, to gain the Privilege of the Three Children; Epictetus another, to obtain the governorship of Cnossus in Crete. Persons accused in the provinces of a capital offence, and there not subject to the jurisdiction of the governors (such as senators, the higher officers, and municipal *decuriones*) were sent to Rome—a frequent sight.

Embassies from the towns, and provincial diets met at Rome at all times; when the Jewish deputation from Alex-

andria came to beseech Caligula, Philo, a member of it, says that ambassadors from the whole world were also in waiting. Greek and Roman inscriptions often record the voluntary undertaking of embassies to the Emperor as a meritorious civic duty: great extravagance was shown in them: Pliny the Younger mentions that Byzantium every year sent a deputy to congratulate Trajan armed with a sum of 12,000 sesterces (£130 10s.), and another deputy to the governor of Moesia, with 3,000 (£32 12s. 6d). Pliny proposed, and Trajan accepted the exchange of these greetings by letter; Vespasian limited the bearers to three. The occasional residences of the Emperors on campaigns or travels became similarly busy. Augustus stayed two years at Tarraco (26-25 B.C.) and two at Samos (21-20 B.C.): we know of an embassy from Lesbos and from India, and can surmise many others. The earthquake at Antioch in 115 A.D., whilst Trajan was there, shook, as Dio says, many other cities, and the whole Empire; it killed many who had come on legal or commercial business, or as sightseers.

Freedom of travel on perfect and safe roads induced a ceaseless movement amongst no few of the subjects: the firmness of this huge world-Empire of over 100,000 square miles united the lands, and made migration common. Any business, unprofitable in one province, might be resumed elsewhere. The father of Vitellius the Emperor was born at Reate, farmed the import tax of 2½ per cent. in Asia, and subsequently had dealings in Helvetia, where he died. Rome received and gave out many emigrants; the provinces, too, were closely inter-related. Greeks and Little-Asians were schoolmasters, e.g. Asclepiades of Myrlea in Turdantania, or rhetors, e.g. Lucian in Gaul, or doctors (like Alexander the Phrygian, reckoned by Eusebius among the martyrs at Vienne and Lugdunum), painters and sculptors (like the master-founder Zenodorus, among the Arverni, i.e. Clermont, under Nero); and so on, throughout the West. King Herod of Judaea had Gauls and Germans in his bodyguards. Jews settled everywhere in the Empire, and were in active communication amongst themselves and with Palestine. From their congregations deputies duly brought gifts to Jerusalem at the proper times: at Passover, from all parts of the world, Jewish pilgrims fared to Jerusalem.

The Christian communities were also closely linked: in 177 A.D. the Churches of Lyons and Vienne sent news of their martyrs to their sister Churches in Asia and Phrygia. No town had not its foreigners: even Corsica, barren, savage, rocky, had more foreign residents, according to Seneca, than natives.

War, also, tore thousands from their homes, drifted them through many lands, and settled them at last very far from their homes: and this too, even after Hadrian's reform of local recruiting had diminished the former distant and expensive transplantations. Only a few provinces like Egypt and Africa could themselves provide the whole of their garrisons. The army annually drew 20,000 recruits, and consisted of 300,000 men on a twenty-five year service, and the provinces, requiring less defence, or more martial in their inhabitants, had to supply the surplus. Tacitus mentions that in 65 A.D. levies for the legions of Pannonia, Moesia and Dalmatia were made in Narbonese Gaul, Africa and Asia. The legions on the Western frontier were generally supplied from the West, and those on the Eastern from the East; and, unlike others, never changed camps. But the officers were sent anywhere and everywhere. Not only the high officers, senators or knights, but also centurions were shifted from legion to legion, from province to province: some centurions served in from five to ten legions or in other troops. When Vettius Crispinus was made legionary tribune, Statius asks, is he to go to Africa, Pannonia, the Danube, Judaea or Armenia? For the most part legionary levies were made in the Senatorial provinces with city civilization. The soldiers of the Rhenish, Dalmatian, and African legions came mostly from Narbonensis, Africa and Macedonia: these countries required no garrisons, and Hadrian levied them for the Praetorians. Similarly the fleets were recruited from Egypt, Syria, Cilicia, Cappadocia, Bithynia, Pontus and Thrace in the East; Dalmatia, Sardinia and Corsica in the West.

Reasons of economy and health required the employment of soldiers in their own country: other reasons limited the practice. Provinces, practically ungarrisoned, had to send their men to less secure regions: the East supplied all the bowmen for the West as well; and political motives also

came in. Lands, recently conquered or unruly, were garrisoned by foreign troops. In Britain, only one of the numerous divisions of cavalry and cohorts of infantry there raised, was there stationed: in Rhaetia, of the eight native cohorts only two; in Pannonia, a soldier's letter of 60 A.D. names seven of the cohorts, of which five were Spanish and two Alpine. In Dacia in 110 A.D. troops from Ituraea (in N.E. Palestine), Spain, Thrace, Gaul, Rhaetia and Britain were stationed under one command; in Rhaetia in 107 A.D. Spaniards, Lusitanians, Italians, Thracians, Slavonians, Gauls, Batavians and Britons. In the military cemeteries, the most diverse nations lie together: inscriptions of officers and men in Mainz show them to have come from the Rhine, Holland, Brabant, Hungary, Carinthia, Styria, the Tyrol, Dalmatia, Rumelia, Syria, Spain, France, and Italy, North and South.

Service in the Guard was for sixteen years at the least, in the legions for twenty, in the auxiliary corps for twenty-five, in the fleet for twenty-six: the men, after dismissal, might return home, especially if home were near their last garrison-duty: generally veterans settled and married in their last province. Augustus, after the battle of Actium, founded twenty-eight military colonies in Italy, and in 14 B.C. many others in Spain, Narbonese Gaul, Africa, the Mauretaniae, Sicily, Macedonia, Achaia, Asia, Pisidia and Syria. Later Emperors followed the same policy, aiming at thus ensuring peace against foes from within and without. Claudius settled veterans at Cumae, Cologne, Sicum in Dalmatia, Camulodunum in Britain, and the two Mauretaniae: Nero in Capua, Tarentum, Nuceria and Antium; Vespasian at Aventicum, Deultum in Thrace, Pannonia and Palestine. The Praetorians were generally assigned lands in Italy, and the legions in the provinces: thus the Fifth and the Tenth were settled at Corduba and Augusta Emerita in Spain, the Second in Cartenna (Mauretania), the Twenty-second at Patrae, the Fifth and Eighth at Berytus and Heliopolis (Syria).

Nerva was the first Emperor to found colonies to relieve the civil population, and bought up Italian land for 60,000,000 sesterces (£650,000) in Italy. The colonization of Dacia in 106 was exceptional: Trajan transplanted 'countless

multitudes from the entire Empire': he thus repeopled the devastated country. Of these non-military colonists of Dacia, we know of Dalmatian gold-miners, above all the expert Pirustae, settled round Abrudbanya: Pannonia furnished most of the miners, most of the incomers were Syrians and Little-Asians: like modern Transylvania, there was a medley of nations. Yet, despite this civil colonization, Dacia remained 'a military frontier peopled by soldiers and veterans; and the cities which grew up with security show their original settlement by veterans, sutlers and the usual camp-followers'.

This universal system of veteran colonies manifestly Romanized and assimilated the provinces, and the constant transplantations quickened intercourse all the more.

Correspondence by letters in the Empire showed more vigour than might be expected from the lack of a letter-post; as the correspondence of a Galen proves. During his stay at Rome, he was consulted for ophthalmia from Asia, Gaul, Spain and Thrace by letter; asked pertinent questions, and sent the remedy, and cured his unseen patients, and through them others. Every year, too, he received parcels of medicines, from friends, or through the imperial or senatorial governors of Syria, Palestine, Egypt, Cappadocia, Pontus, Macedonia, Gaul, Spain and Mauretania. In Augustus' time, Roman booksellers sent books oversea to Spain and Africa; and more difficult transports were also effected. In one case water from a medicinal spring at Santander was sent; this must have been frequent. Pliny's account of live geese being imported from Boulogne over the Alps, proves an active commerce between the provinces. Fruit trees from Italy were exported to the provinces very quickly: four years after the conquest the cherry was being cultivated in Britain. Animals, the wildest and the biggest, were imported into Rome and other great cities in masses for the games. At the end of the fourth century, in the Circus at Antioch, Spanish horses were used: this indicates that the best horses for breeding and racing, the Cappadocian and the African, must have been most extensively trafficked in.

§ 2. COMMERCIAL INTERCOURSE

(i) *The Journeys*

The imperial roads promoted travelling in general, and commerce in especial. In their scope was one of the portions of the earth, which was more prosperous and civilized than ever before or after. Free trade never had a wider field, with a single empire and currency. 'The Roman penny under the Republic was the only legal coin, accepted in Italy and in Spain and Syria. Augustus' reform consisted in making all legal payments in *denarii*.' Egypt alone exceptionally used *drachmas* as legal tender. In the Western half of the Empire the penny was the only silver coin; in the Eastern the old silver mintage subsisted as well. The imperial copper also obtained throughout the whole Empire, but in the East was hardly used, local moneys replacing it. In gold, there was only the imperial coinage.

Beyond the frontiers, too, Roman moneys extended. Under Claudius an embassy from Ceylon came to Rome, headed by a freedman of Annius Plocamus, farmer of the custom-duties in the Red Sea. He had been circumnavigating Arabia, and been driven on to Ceylon, and there had made a chieftain court the friendship of Rome: whose wonderful *denarii* had all the same weight, but different effigies. 'But Nero debased the silver coinage, and the barbarians had little occasion for further wonder.' The free Germans, who preferred silver as more convenient to their commerce, after that date, accepted payment in the old worn-down Republican pennies, with a chariot on the reverse; and the coins dug up show that the old Republican penny was better currency than the early imperial coin which was as good, obviously because it could readily be distinguished from Nero's.

For foreign commercial enterprises the greatness of the World-Empire assured its subjects protection. Cicero says that the magic words *civis Romanus* were of service to any Roman stranger anywhere in the world, amongst barbarians, however remote, Indians or Persians. Merchants of that day found their road ready paved to all three continents, and went on these easy roads to greater and more manifold prosperity. To a degree now impossible commerce had the world in fee, and the profits of Europe were great to the

same extent as they were superior in civilization. Modern European commerce reckons on 10 per cent. profit in Europe, 29 per cent. outside, 35 per cent. in India, 33½ per cent. in Java, 58 per cent. in China and 66 per cent. in Japan, but Roman profits must have been still greater. The peace of the world was assured, many new provinces were there to be exploited and money had a quicker circulation, and the expansion of the world-trade was the main reason of the greater wealth of Imperial than Republican Rome, which Pliny the Elder characterizes as comparatively poor. Our scanty information of the marine and land commerce still furnishes an idea of its extent, vigour and variety.

The merchant of those days had to travel much more, and personal negotiation was essential where now a letter suffices. Knowledge of men and things had to be personal, 'just as in the Middle Ages, before the first regular posts, German merchants had personally to travel to Antwerp, Brussels, Amsterdam, Augsburg, etc.'

'Hasten, merchant', Horace says, 'in order that none forestall thee in the havens, that thou do not lose the iron of Cibra and the aromas of Bithynia'. 'Hurry', writes Persius, 'get salted fish, tow, beaver's cod, ebony, incense, Coic silk-flowers from the Black Sea, be first with the camel's load of pepper'. Juvenal speaks of 'voyages to Cilicia and Crete for saffron, raisin-wine'. And Horace makes the roving merchant traffic from sunrise to sundown, from Arctic zones to the Tropics, and even sail in the winter. A poet slightly later makes the merchant hawk his capital of foreign goods through the cities, anticipate great losses of corn by fire, and then set his ships a-sea. To the world he sold the world's goods, had commercial relations in unknown lands, and every new sun was to be gold for him. 'Very many', says Pliny, 'embark for gain on any sea that is opened'. An inscription, by chance preserved, of a merchant of Hierapolis in Phrygia, Flavius Zeuxis, celebrates his seventy-two sailings by the Peloponnese to Italy, and suggests the many perilous mercantile voyages. The Talmud mentions voyages of Palestinian Jews to Rome and Spain. Horace says that the merchant adventured into the Atlantic three or four times a year, and Gades had especially lively commercial relations with Italy. An inscription of Gaius Octavius

Agathopus at Puteoli records this as his resting-place after many wearisome journeys East and West.

The Mediterranean, the Black Sea and the Atlantic teemed with Roman ships. 'Look', says Juvenal, 'at the harbours and seas filled with great keels, more peopled than the land ; greed lures great squadrons of ships, not only in the Archipelago and Africa, but far beyond Calpe [Gibraltar] to where the sun sinks hissing in the waves'. 'Day after day', says Aristides, 'merchant ships and merchants sail both seas [the Mediterranean and the Atlantic], and to Britain, not only officials and troops go, but countless private people'. Under Augustus even, to whom several chieftains had done homage, the Romans went to Britain as though to their own country, and, under Domitian, the harbours of Ireland were known to commerce.

The conquest of Egypt opened up a new era to Roman commerce ; the road to East India. 'Merchants', says Pliny, 'have learnt the shortest way, and commerce has brought India near to us'. Hippalos was the Egyptian sailor, who, under Nero, discovered the South West Monsoon to India : the wind was named after him. From Alexandria in the height of the summer, up the Nile, to Coptos took twelve days, with a good wind. At Coptos the goods were laden on camels, and the caravans went North-East to Myoshormos in six days, or South-East to Berenice, a busy harbour-town with warehouses and caravanserais, in twelve days. In Strabo's day, the first route was used ; in Pliny's only the second, as the way to Arabia, India and Aethiopia ; Roman garrisons lined the route. The caravans crossed the Upper Egyptian desert at night, steering by the stars, the days being too hot, from well to well, resting by day. Under Augustus wells or cisterns were laid by the Roman soldiers at suitable points on the roads to Myoshormos and Berenice. From Myoshormos, in Strabo's time, 120 ships sailed through the Gulf of Arabia to India, with archers on board to guard against pirates : some, the *Ascitae* of South Arabia, used poisoned barbs. In Pliny's time, thirty days from Berenice brought the ship to Ocelis in Arabia at the South end of the Red Sea, or to Cane on the South coast of Arabia ; whence it was forty days to Muziris on the coast of Malabar (? Mangaluru) : pirates and other reasons deterred them from stopping there ;

they went on further South to Barace (Barygaza). The ships were speedily lightened and loaded: in December with the North-East Monsoon they returned to the Red Sea, and thence with the South wind, which prevailed as far as Berenice. Alexandria to India is now eighteen days: it was then ninety-four; the journey there and back took six months from the summer solstice to February.

The merchants of Italy and the West cannot imaginably have left the Greeks and Egyptians the monopoly of this profitable trade. Horace's words bidding the merchant gird himself to sail to the farthest Indies must be taken literally: Seneca, too, philosophizing on the minuteness of the earth, said only a few days lay between farthest Spain and India, a hyperbole which must have had some basis in fact. Pliny the Elder's knowledge of the natural features of Further India shows it was then visited by Greek and Roman merchants, whose written or verbal tales he incorporated. The *Periplus of the Erythraean Sea*, an Alexandrian *portolano*, is preserved, which describes the East coast of Africa up to the promontory of Rhaptum (? Kilva), beyond Zanzibar, and including the coast of Malabar, and dates from the first years of Vespasian. Dionysius, the author of a description of the earth in verse, under Hadrian, says, he is neither a merchant, nor a sea-farer, and does not go through the Indian Ocean to the Ganges, 'like the many who stake their lives for vast wealth'.

Ptolemy's Geography of about 150 A.D. proves a great development of Roman commerce with India. He had 'reports at hand giving distances in *stadia* not only from the promontory of Cory (the sea of Caly) to the mouth of the Ganges, and thence to the Golden Peninsula, or Malacca, and thence to Cattigara (Hanoi in Tonking). The numerous Greek translations of Indian city-names in Ptolemy (mostly in Taprobane or Ceylon), prove a lively intercourse of Greek and Egyptian merchants in these places: probably they settled there as they did in South Arabia or the island of Socotra. Ptolemy knew where the Indian harbour Simylla lay with respect to 'the gulf of Barygaza, from men who had 'shipped there frequently, as well as from Indian visitors'. In the Punjab and Further India, Roman coins are found, imperial gold coins, late Republican and early Empire *denarii*

and Alexandrian *tetradrachmae*. Strange to say, the most common is a penny of Augustus with the effigies of his two adoptive sons Gaius and Lucius, for the most part plated; possibly this coinage was designed for India, where *denarii*, good or bad, could not be as readily distinguished. In the ruins of Mantotte in Ceylon, coins from Augustus to the Antonines have been found. Beyond Ceylon and Cape Comorin coins are only rarely found. Thirty years ago, a hoard of gold coins of the late Empire was discovered at Calcutta.

China, for Pliny and Strabo, lay at Tokharistan, which still belonged to the Greek-Bactrian Empire; there the silk-caravans reached the limit of the known world. The embassy from Ceylon to Claudius, according to Pliny, told the same tale as our merchants, that goods to be bartered were laid on the banks of a stream, beside the silk, and the Seres, if satisfied, took the wares away. But Marinus of Tyre, the geographer (at the latest, of the first half of the second century), had received from a Macedonian merchant, Maes, who was called Titianus, a description of a caravan road to China: he had organized an expedition to Issedon, a town in China. The route cannot be absolutely determined. The caravan set out perhaps North-East from Balkh to Hissar, thence East through the hills to Surkhab, to the beginning of the ravine of the Comedi (Carategin). Just beyond the pass, where the hills fell, lay the Stone Tower, a place much visited (? now the Ruins of the Fortress, Daraut-Kurgan): in the same latitude 43° lay the place due East, Kashgar, whence the China caravans started. Thence they proceeded to the Chinese capital, possibly Si-ngan-fu. In the province of Shan-si, sixteen Roman coins from Tiberius to Aurelian have been discovered. According to Chinese reports, Rome exported carpets, glass, metals, coloured stuffs, jewels, amber, corals and drugs. Further (according to a Chinese work on plants imported oversea) Canton must then have been open to foreign commerce.

Chinese official chronicles have some details on China's relations to An-Si (Parthia) and Ta-Tsin (the Eastern Roman Empire, and especially Syria). In 120 A.D. the King of Parthia sent Syrian jugglers and musicians to the Court of China; they acted before King An-ti on New Year's

Day, 121. In October, 166, an embassy from An-Tun (Marcus Antoninus), the King of Ta-Tsin, came by sea by Tonking to the Emperor Huan-ti. According to the Chinese chronicle the Kings of Ta-Tsin had long wished to send embassies to China, but the An-Si prevented direct silk-trade, wishing to retain the monopoly of negotiating it. These 'ambassadors' may have been merchants, self-styled officials; their gifts were not imperial in character; such as elephant's teeth, rhinoceros horns, tortoise-shells. In 284 a so-called embassy from Ta-Tsin gave the Emperor of China 30,000 rolls of paper, probably a company of Syrian or Alexandrian merchants. Chinese writers also speak of two embassies from China to Ta-Tsin which did not reach their destination. One Kan-Ying, sent in 97, only got as far as the Persian Gulf. In 226 A.D. a Syrian merchant was presented to the Emperor of China, and accompanied back to Ta-Tsin by Chinese officials; the latter was to give the King of Ta-Tsin (on the Syrian's advice) ten male and ten female dwarfs, but he died on the way. But China knew something of Ta-Tsin, of its use of glass in architecture, of the great roads, and post (which China also had), of the lions and tigers which abounded in Mesopotamia, and also of the Pygmies and Amazons who lived South of Ta-Tsin. Of An-tu (Antioch), the capital of Ta-Tsin, they knew it consisted of four walled towns, with a great wall all round, and that there was a clock with a golden ball that fell at every one of the twelve hours.

The North of Europe was known to Rome by the amber-trade. The Baltic coast had long been explored; and Pliny tells us of a voyage there in the first century. Under Vespasian there still lived a Roman knight, who had been sent there to purchase amber in large quantities for a gladiatorial exhibition. From Carnuntum (Petronell near Vienna) he reached the Baltic coast and discovered, for the first time, it was 600 (Roman) miles from Carnuntum. This tour may have been unique: middlemen managed the amber-trade. And other articles must have been got from the North, for Roman coins and fabrics (especially in bronze) are found all over North Germany, from West Prussia to Hanover, and Denmark and the South of Norway and Sweden. These finds point to a long and lively intercourse with the Roman world,

and their distribution along the great rivers and the natural fords into higher and drier regions indicates which were the commercial roads. In Silesia the oldest hoards have been discovered, dating from the Republic: thence the road led South by Moravia and Bohemia into the Empire and to the Adriatic.

In East Prussia Roman coins are found partly singly and partly in hoards (which was taken before as a proof of a direct amber-trade); but they can hardly have come there before the end of the second century, probably in consequence of the migrations, the first of which came to light in the war with the Marcomanni. For the tombs in which these coins are found must be assigned to this date, and new forms of decorative articles appear with them.

The Northern trade of the Roman is established by countless finds of stuffs and coins over all this wide area, and demands not only a long commercial route far beyond the frontiers, but also a large number of temporary settlements in barbarian lands; but only one case is mentioned in literature, in Tacitus. In 19 A.D., he says, Roman hucksters and merchants pierced through as far as the stronghold of the chief of the Marcomanni, Maroboduus (Boihemum or Boiohemum in Bohemia), attracted by the freedom of trade, secured by a special treaty, and by commercial greed; finally settling in a hostile country and forgetting their own.

The regularity of these long journeys in the first two centuries makes voyages of Roman, Egyptian and Greek merchants on smaller scales beyond the frontier normal. In Strabo's time, even, fleets went from Alexandria to farthest Aethiopia, and the Land of the Troglodytes. Coptos, in Upper Egypt, teemed with merchants, who travelled into Aethiopia and India. Diodorus describes the Ichthyophagi of South Arabia on the authority of Egyptian merchants, who had landed on that coast. Pliny makes the journey from Ptolemais Theron (on the Aethiopian side of the Red Sea) to Adule, the principal harbour of the Troglodytes and Aethiopians (in an inlet South of Massowa), last five days: at Adule ivory, rhinoceros teeth, hippopotamus skins, tortoise-shell, monkeys and slaves were imported. But merchants travelled yet farther; to the harbour of Isis, ten days from Adule (South of the Babelmandeb strait),

where the Troglodytes brought myrrh ; to the harbour of the Mossyli (opposite to the South Arabian coast), a staple for cinnamon and cassia. Rhaptum, near Zanzibar, was the farthest point South known to Egyptian merchants ; and in Vespasian's time ships sailed there from Muza in South Arabia. Roman merchants were the first to explore as far as Charax Spasinu (near the mouth of the Tigris) and report on the distance from the Persian Gulf : they may have journeyed there from Palmyra in caravans (*συνοδιαί*) ; evidence is extant for the second and third centuries. At Petra in Arabia Athenodorus, the friend of Strabo, found Romans amongst the strangers there congregated. The inhabitants of Socotra, the island of Dioscoridis (near Cape Guardafui), were, according to the *portolano* of the Erythraean Sea, a mixture of Arabians, Indians, and Egyptian-Greeks, there engaged in commerce.

Before Caesar's conquest of the 'long-haired Gauls', Romans had entered Gaul, from Narbonensis and from Italy over the great St. Bernhard—the pass was dangerous and the tribes demanded a high fee—and even as far as the savage Belgae. Italian merchants in Gaul trafficked most and best with wine, transported by river, and by waggons : a cask of wine bought a Celtic slave. During Caesar's campaigns, at all the greater towns, such as Cenabum (Orleans), Cabillonum (Châlons), Noviodunum (Nevers), there must have been Roman trade-settlements of earlier date ; in the late Republic at all foreign trade-stations there were such, e.g. Delos, Alexandria and Cirta in Numidia. The Campaign of Marcus Vinicius, in 25 B.C., against Celtic tribes was caused by the barbarians murdering Roman merchants. On the East coast of the Black Sea, Trajan established a chain of forts. Arrian, at a well-chosen castle at the mouth of the Phasis to guard the shipping, found a garrison of 900 select troops ; and had a moat dug from the foundations of the fortress to the river, to protect such veterans and merchants as lived outside.

Dioscurias or Sebastopolis was the staple-town for Caucasia ; seventy or even three hundred languages were said to be spoken there ; Roman merchants had to employ 130 interpreters ; under Hadrian it had a Roman garrison ; in Pliny's time it had been devastated. In the harbours of the Sea

of Azov there was a lively trade between the civilized lands and the steppes of South Russia.

Thus trade from all parts of the Empire followed the eagles; merchants and soldiers were fellow-pioneers. Their lanes of booths and huts (*cannabae*) quickly clustered round the camps, soon to become cities. Commerce was thus a great Romanizing agent. Ammianus Marcellinus remarks that Aquitaine, the part of Gaul first opened to Roman trade, was the least resisting to Roman culture. There is much evidence as to how swiftly and energetically merchants seized on provincial trade and often monopolized it. Narbonese Gaul, fifty years after the conquest, was full of Roman citizens and merchants; without their aid no provincial did any business; every penny passed through their books. The murder of Roman merchants in Pannonia in 6 A.D. (fifteen years after the conquest), as in 26 A.D. amongst the Treviri, was the signal of revolt. In 88 B.C. Mithridates ordered the murder of every Italian in Asia (which had been a province for forty years): 80,000, or even 150,000 are said to have been slain. Most of this population must have been commercial; twenty-two years later Cicero speaks of industrious merchants of all ranks engaging in business or investing in Asia. In 46 B.C. there were at Utica 300 Roman bankers and wholesale dealers; in the neighbouring towns of Thapsus and Hadrumetum there were Roman commercial companies. London in 61 A.D. (eighteen years after the conquest) was thickly peopled with merchants; and many of the 70,000 massacred citizens and allies must have belonged to this class. The *conventus* of Roman citizens consisted mainly of merchants: and for the first two centuries in the Eastern provinces were an established institution, raised by their privileges and importance to great authority in the towns.

Beside these Italians, many provincials settled in the seat of their new businesses. An inscription at Celeia (Cilli) (under Antoninus Pius) was subscribed for by 'Roman citizens of Italy and other provinces in Rhaetia'. Inscriptions at Augsburg speak of merchants of Lyons, Trèves and Bourges. At Aquileia, a tomb of a man of Cologne has been found, who thence traded with Dacia: at Gythion in Laconia that of a shipping agent from Nicomedia, resident in Cyzicus:

at Pola, the tomb of a clothes' dealer from Gaul ; at Celeia (Cilli) that of an African merchant. At places like Aquileia, the great staple-town for the through-traffic from the North-East provinces to Italy, the East, and Africa, the merchant-population must have been cosmopolitan.

The most numerous, however, were the Orientals. Berytus, Damascus and other Phoenician and Syrian cities had factories at Puteoli. Tyre, in the fourth century still the greatest commercial city in the East, had one at Puteoli, and one at Rome ; the latter was directed by the Tyrian Senate to pay 10,000 *denarii* to the former for expenses. At Perinthus a statue was erected by the Alexandrians there. There and at Tomi on the Black Sea (where they put up an altar to Serapis, and to the Emperors Marcus Aurelius and Lucius Verus), and in all great towns, Alexandrian commerce abounded. The centurion who accompanied St. Paul to Italy found an Alexandrian ship sailing there at Myra in Lycia. The Syrians were the most common. As regards the Jews the absence of evidence for any commercial settlement can hardly be accident. Syrian merchants and factories occur everywhere, in Italian harbours, such as Portus, Naples, Ravenna, and Puteoli especially. A Spanish inscription at Malaga records a president of the Syrian college ; according to his tomb, set up by his father, a Syrian merchant, Aurelius Flavius, died at Sirmium ; another, Teym-ibn-Saad, a former burgess and councillor at Canavat in Syria, did business from Aquitaine to Lugdunum ; at Apulum in Dacia has been found a votive stone set up by two Syrian merchants to Jupiter. All Syrians mentioned in Western inscriptions may be presumed to be merchants. The foreigners buried at Concordia, a little country town in North Italy (in the fifth century), are all Syrians, mostly Apameans ; and all the Greek inscriptions at Trèves are Syrian. 'To the present day', says St. Jerome about the end of the fourth century, 'commerce is the genius of the Syrians, compelling them to wander through the whole world, and, even now, when the Empire is held by barbarians, driving them to seek wealth in the midst of armed camps'. In the language of the fifth century, or, at least in Gaul, 'Syrians' (like 'Lombards' in the Middle Ages) meant bankers. Salvianus speaks of the many merchants and 'Syrians', who owned

the greater part of most of the cities ; Apollinaris Sidonius, describing the topsyturvydom of Ravenna, says that the priests lend money and the 'Syrians' sing psalms. In the Life of St. Geneviève (about 450 A.D.) merchants travelling from Gaul to Antioch are mentioned ; and in the sixth century, there were still settlements of Syrian merchants in Gaul. St. Gregory of Tours speaks of those at Bordeaux and Paris, and clearly distinguishes them from the many Jews. When King Guntram on the 4th July, 585, entered Orleans, he was greeted with songs in Latin, Syrian and Hebrew. In 589 the Council of Narbonne ordained that on Sunday, no Goth, Roman, Syrian or Greek or Jew do any labour. Syrian wines were in favour in Gaul in the fifth and sixth centuries, especially those from Gaza, Sarepta and Ascalon. Charlemagne even employed Greeks and Syrians to correct the Gospels.

(ii) *The Distribution of the Goods*

On the actual distribution little evidence is extant, but sufficient to show that any goods could be transported to any good market, anywhere. Rome was the place most fully supplied ; the wares of all climes and seas and crafts were all assembled there. Aristides says Rome and Corinth ever had a superfluity of the world's work : and, at Alexandria, snow only might not be had. And, according to Libanius, Antioch with its ready market, attracted ships from all parts, laden with all that was best. Other great cities were as amply furnished. Arelate (according to a document of 418 A.D.), by land and sea and river, got wares from the East, Spain, Gaul and Africa.

Articles, found only at a few places, partly outside the Empire, were everywhere on sale. In the Gazetteer of the World of the fourth century, Alexandria is mentioned as the sole distributor of paper ; in the sixth century, paper and other Egyptian goods, such as roots and herbs, were exported to Marseilles, and, no doubt, other Mediterranean harbours. Amongst the valuables exported from Alexandria, the fourth-century Gazetteer mentions spices, no doubt comprising incense, which was in universal demand. Tin, an essential constituent of bronze, was then only known in

Spanish Galicia, West Gaul, the Sorlingian Islands and Cornwall, but was in stock almost everywhere. In the early seventh century even, Alexandrian ships sailed direct to Britain, to barter corn for tin; tin was exported again to India and exchanged anew. The cheapness of amber is shown by its being worn, in Pliny's time, by Lombard peasant women, in necklaces, as amulets against swellings of the throat. In the days of Diodorus even, the products of the ironworks of Elba were scattered all over the world. Many, then, of the Roman-made weapons, so common in the graves of the North from Silesia to Scandinavia, may have come from the smithies at Puteoli; but most came from the semi-civilized frontiers, though some of the Northern finds have the Italian hall-mark. In Denmark, Switzerland, Hanover, Pomerania, England and Scotland, stewpans, bearing the name of Publius Cippius Polybius (or Polybus), have been found, shaped like those at Pompeii: and some of one Nigellus' fabrics at Fünen and the Savoy. Besides the potteries in the Greek Islands (Cnidos, Rhodes and Thasos), which had wide sales, in Roman times potteries arose in Pergamus, Saguntum, Arretium and Mutina (Modena), also exported in every direction, with their famous hall-marks. Lyons also had a brisk trade in clay articles, extending all over Gaul, England, Upper Italy, the Alps, the Tyrol and Hungary, all with the same hall-mark. Alexandria manufactured glass in all the shapes of the imported clay fabrics. The linen of the famous factories of Scythopolis, Laodicea, Byblus, Tyre and Berytus, according to the fourth-century Gazetteer, was also exported everywhere; and so too, says Procopius, the silk of Berytus and Tyre. The tariff of 301 A.D., issued by Diocletian for the East, specifies mostly oriental goods, and some Western fabrics, sold in the East; such as Italian wines (seven sorts), sausages and hams, African carpets, mantles and dresses from Gaul (e.g. the Nervian fabrics; Tournay still is a weaving town), and Numidian, Rhaetian, British clothing: Gallic linen, Tarentine and Asturian wool. In Laodicea Nervian mantles were imitated. According to Galen, so-called Falernian wine was exported everywhere; but, Campania being so small, the dealers must have manufactured something similar. Lastly, of the luxuries of the table, fish sauces came from

Cartagena (*garum sociorum*), tunny-fish sauce (*muria*) and others from Antibes and Byzantium; and from Spain fresh jars of quince-jam went to Rome: one grocer of Reate dubs himself 'Dealer in all transmarine goods'.

§ 3. TRAVEL IN GENERAL

Not only change of residence, official tours, military marches and commercial voyages, but many professions compelled constant travelling. The absence of posts and a press and ancient customs further increased the need.

Very many travelled to gain knowledge. To learn from one's own eyes was more usual than now; for ancient methods taught much more through actual sight; and book-lore was rarer and less perfect. Hence the learned (such as Posidonius, Diodorus, Strabo, Apio, Pausanias, Dioscorides, Apuleius and Galen (who insists on the need of doctors travelling much) required long tours; and less eminent men, too, would wander far a-field to widen their scope. 'The most famous philosophers', says Cicero, 'spent all their days travelling: very many never returned home'. Plutarch's friend, Cleombrotos of Sparta, a rich and leisured man, travelled, for knowledge' sake, visiting even the Troglodytes, the shrine of Ammon, and the shores of the Red Sea. And Cleombrotos, an honourable and high-minded man, could tell unblushingly of a prophet on the Red Sea, who spoke Doric, whose voice was only heard of man once a year: such were the travellers' tales of that time, as to places scarce visited. For personal interviews travels would be undertaken; Galen says he made many voyages by land and by sea, to meet all of the pupils of Quintus the physician. Artemidorus of Daldis, the dream-reader, who was very much in earnest for his science, visited Greece, Italy, Little Asia, and the Islands, to know as many colleagues as possible, and learn from them.

But youth was the time to travel and leave home. Young men regularly left their parents' house to be better educated elsewhere. 'Shall young men leave home and parents and friends and kin', Epictetus asks a sophist, 'to hear you splitting hairs, and to say Oh! at your perorations?' Every province and district in the more civilized parts had its academic

city, to which students came from far and near. Scopelianus the sophist was begged to found a school in his native city Clazomenae, and so raise its fame. Cremona and Mediolanium in Cis-Alpine Gaul were much frequented, as Augustodunum in the region of the Aedui. Carthage in Africa, Apollonia in Epirus and Marseilles were more than provincial cities: at Marseilles Romans went to study. From 6-2 B.C. Tiberius, whilst at Rhodes, was a zealous student: the school was much patronized in later ages as well. In the Asiatic provinces, Tarsus in Cilicia had most students (in Strabo's time, only natives), and, according to Philostratus, Apollonius of Tyana was there educated; thus, too, Antioch, in Syria, was in Cicero's days a centre for learned men and learned studies, and, above all, Smyrna, which taught the youth of Little Asia, Greece, Assyria, Phoenicia and Egypt. 'All the Muses who descend to man', says Aristides, 'haunt Smyrna: she teems with her own sons and with foreigners: the town is the hearth of learning for the Continent'. But Rome, Alexandria and Athens surpassed all. Athens owed her throng of foreign students to her schools of rhetoric and philosophy, and her training-home for men (the *Ephebi* Institute), which was visited largely from the semi-Greek lands, North and South, where it was a glory to have passed through the recognized Hellenic school. In the third century, it was found that Attic had been corrupted by constant intercourse with young Thracians, Pontines and other barbarians. Sometimes there were more foreign *ephebi* than native: in 55 A.D., 114 of the former. Under Marcus Aurelius students came from the entire East, from Arabia and Mesopotamia, Libya and Egypt. Athens and Rome (and, later on, Constantinople), with their State-paid chairs, most resembled the modern German University.

On the other hand, both teachers and students of all kinds led a migratory life. Rhetors and sophists found the nearest road to fame and wealth in educational and lecturing tours. Lucian was intended for a sculptor, but chose oratory: in his *Dream* he makes both court him: Sculpture suggests that her service gives him a fixed home: elsewhere Rhetoric declares she married him, had been a faithful wife, and brought him a dowry of honour and prosperity on his tours in Greece, Ionia, across the sea to Italy, and at last even

in Gaul. The most celebrated teachers then wandered far a-field, as Philostratus' biographies show, very much like the lecturers of the Renaissance. Aristides is excepted by Philostratus, as not travelling much, as having visited only Italy, Greece and Egypt. They began their courses with a panegyric of the city they were staying in; and to the eminent, statues would be thus locally erected: Apuleius congratulates himself that mean towns even granted him this honour.

Not only amongst the rhetors and sophists, but amongst physicians and grammarians the *circulatores* or *περιδευταί* were distinguished from the resident. The physician, Publius Scribonius Primigenius, a freedman, says, on his tombstone, that he was born at Iguvium, had travelled much, and been famous for his skill and his reliability. Quacks also perambulated in this fashion. When there was no post and no press, charlatans obtained most vogue by travelling and making personal acquaintances, as did Apollonius of Tyana, and Alexander of Abonuteichos, who used to send out emissaries in advance, to hawk his fame.

Artists were mostly always on the road. The craving for the artistic side of life throughout the whole Roman world is evidenced by the countless ruins of artistic work in every province; and the huge demand could only have been satisfied by 'colonies, expeditions, swarms or clouds of artists, and artists hovering about, ready to settle down anywhere'. One inscription of a wandering sculptor, Zeno of Aphrodisias, is extant, who, trusting to his art, visited many cities; statues, bearing his name, have been found at Rome and Syracuse.

Actors, musicians and athletes made constant tours, in troops, or singly; especially in Greece and Little Asia, where the smaller towns even had their periodical *ἀγῶνες*; the West imitated them more and more. Even in Demosthenes' day, the cult of Dionysus attracted numberless votaries, and later ages did not fall behind. These 'Dionysian' artists formed regular corporations, dedicated to Dionysus, which played in certain places, or toured about: an Athenian company is mentioned at the end of the fourth century B.C. in an Amphictyonic decree. In the Hellenistic age, drama flourished most in Ionia. The greatest of all the companies there was that of Teos, the City of Dionysus: in Strabo's

time it had moved to Lebedos, and celebrated annual 'festivals there, and all the sections touring about Greece and Little Asia met, sacrificed and competed. In the Empire these companies amalgamated into one, which selected Dionysus, or the New Dionysus the Emperor, as its patron. The theatrical synod at Nîmes was called after Trajan, and is the same as one found in a later inscription 'the Holy Hadrianic Synod of the Honourers of Hadrian, the New Dionysus': it sent decrees to Ancyra in Galatia and Aphrodisias in Caria (one of 127 A.D. was unearthed): it is there called the synod of the artists of the realm (ἀπ' οἰκουμένης). Under Antoninus Pius it was called 'The Great Sacred Antonine Traveling Company of Artists of the whole Empire, honouring Dionysus and the New Dionysus, Antoninus Pius'. It had many sections, some staying for a longer or shorter while at the same place, especially Rome. The athletes, too, formed companies, which often united with the Dionysians. As members of these unions, or independently, famous actors, musicians and athletes regularly toured through Greece, Little Asia and Italy, as their numerous inscriptions show. One Marcus Sempronius Nicocrates says in an epitaph of his own composition that he had been a musician, poet and cither-player, and, above all, member of a synod; his travels by land and sea had given him much trouble. Actors and athletes would often be given the freedom of the cities where they aroused enthusiasm. One Aurelius Charmus, a famous singer, a citizen of Philadelphia, Nicomedia and Athens, won the laurel at all the sacred competitions, from the Capitoline to that of Antioch. An athlete, Marcus Aurelius Asclepiades, a citizen of Alexandria, Hermopolis, Puteoli, Naples and Elis, a senator of Athens, and citizen and senator of many other cities, says he performed in three countries, Greece, Italy and Little Asia; as a poet of the Early Empire says of Glycon the Pergamene pancratiast. A list of buildings, put up by a Corinthian priest, Publius Licinius Priscus Juventianus (? circa 200), mentions inns for athletes, who from the whole world came to the Isthmian games. Festival-givers often invited artists of every kind from the towns most famous, e.g. in the fourth century, charioteers from Laodicea, mimes from Tyre and Berytus, pantomimes from Caesarea, flute choruses

from Heliopolis and athletes from Ascalon. Of course, gladiatorial companies made tours. Of the transport of wild animals over enormous distances to the *venationes* I shall speak later.

Feasts and spectacles, at Rome or in the provinces, attracted countless foreign spectators. The Olympian and the Pythian games assembled all Greece, not only as late as the third century, but even under Julian the Apostate: vehicles were scarce at their conclusion. Peregrinus Proteus burned himself to death at the Olympian Games in 165, the most frequented spectacle of Greece; as Lucian says (he visited the Games four times), to advertise the feat thoroughly well.

At such assemblies traders of all sorts, with an eye to profit, met. Dio of Prusa says that pandars with their girls travelled to the autumn meeting of the Amphictyonic Council at Pylae, and elsewhere. Pandars generally travelled much; the wretches go about, says Clement of Alexandria, by sea, with a cargo of girls, instead of wine. Strabo says, that, at Carura, a place much visited for its springs (on the frontier between Phrygia and Caria), an earthquake swallowed up in one inn a whole such troop. Sempronius Nicocrates abandoned music, as he says, to traffic in beauties—also a migratory business.

Further, even the banished and relegated might attend the great festivals, the Mysteries of Eleusis, the Feast of Dionysos at Argos, the Pythia at Delphi, the Isthmian Games at Corinth. Of the religious festivals, the Eleusinian Mysteries attracted Romans even more than any other: Athens was crowded at that season. Next ranked the Mysteries of Samothrace, especially with the Romans, as it was fabled Troy had thence been colonized: hence many Roman generals and officials were initiated, and endowed the shrine. Thus this distant, inaccessible island was a centre of pilgrimage, as is now Athos, especially in the height of the summer, when the festival was held. Inscriptions in Samothrace record ambassadors from Macedonia, Little Asia and Thrace, Crete, Elis and Rome (whose legates are called *mystae pii*), as well as individuals. 'With the same awe as the modern Greek skipper or wanderer gazes at Athos, his ancestor may have sought the high cliff of Samothrace; and, in both places, a priesthood, equally ignorant, similarly gabbling traditionally

holy formulas, may have impressed the people and sterilized, custom, language and art.' To-day only the shepherd's voice is heard.

Besides these, there were other pilgrimages, to Eresos in Lesbos, where the footmarks are carved upon the flag-stones, and inscriptions read 'Remember the brethren'; to Comana in Pontus, whither, at the procession of the great goddess, both men and women flocked, some in pursuance of a vow to offer sacrifice. This place was also the centre of the Armenian trade, and full of *ἐραῖποι*, who mostly belonged to the temple; a little Corinth. And many, like Apuleius, may have wandered from shrine to shrine and sought manifold initiations and propitiations. And never were the oracles of Greece, Little Asia, Egypt and Italy more visited than in the first two centuries.

Voyages for health were also very common. Doctors are right, says Epictetus, to recommend a change of air for lingering illnesses. Lunacy, constant headaches, paralysis, dropsy, bladder troubles, and especially incipient lung diseases, and spitting of blood were thought curable by a change of climate: consumptives were sent from Italy by sea to Egypt or Africa. Galen says many such consumptives returned seemingly cured, and remained in health for some years, but relapsed owing to excesses in living. Sometimes they were advised residence in pinewoods, or milk-cures in mountains overhanging the sea; Galen recommends, for their situation, air, vegetation and cattle, Stabiae (Castellamare, still so used). In the sixth century, even, Mons Lactarius, near Stabiae, was a home for consumptives; Cassiodorus praises 'the good air of the place, its fertility: the sweet herbs, and the healthy milk, which alone suffice to cure'. Anticyra in the Gulf of Crisa was the most famous place for medicinal preparations: it was more visited by patients than the Anticyra at the foot of Mount Oeta, where the best hellebore grew, for at the former it was better concocted. The temples of Aesculapius, Isis and Serapis, with their hospitals, were very much sought.

Bathing resorts were used as much as they are now, and many of the springs had been discovered, such as Baden, near Zürich (as early as 160 A.D. a busy invalid town), and the *thermae* of Teplitz, Ems, Pyrmont, Aix-la-Chapelle contain

R.L.M.

Y

many Roman implements. Bath was visited very soon after the occupation, and richly fitted up. Many fine ruins are still there of the temple of the goddess Sulis, or Minerva, or other deities, remains of the baths, several artistic fragments (a 'woman's bust of Domitian's time' amongst them). Almost all the inscriptions and dedications are of the end of the first and beginning of the second century ; but the continued popularity of the place may still be inferred, the older buildings being used in reconstructions. Remains of Roman bathing-resorts, often very gorgeous, can be traced along all the Mediterranean coasts, and in Africa, e.g. in Hamam Rirra in Algeria, the Pyrenees, the Carpathians (Mehadia), the Alps and Auvergne. Some of these were also pleasure-resorts, e.g. Baiae, Aedepsus, Canobus. Men also travelled for distraction and recreation.

It will thus be seen that travelling in the Empire was more extensive than in Europe up to the nineteenth century. This impression will be strengthened, after considering tours for recreation and education, the knowledge of which is essential to the student of Roman civilization.

CHAPTER VII

TOURING UNDER THE EMPIRE

I. THE INFREQUENCY AND LIMITEDNESS OF DISCOVERIES—THE GEOGRAPHICAL HORIZON—THE EXTENT AND AIM OF TOURS

THE ease of travelling and the good communications must have been widely felt as an incentive. Voyages were more often then made to gain new impressions and education than now. Pliny calls human nature 'migratory and curious'. 'Many', says Seneca, 'make sea-voyages, endure long journeys alone, for some remote sight. For Nature, self-conscious of her craft and beauty, made us born admirers : her jewels would be lost in a wilderness'. Very many gladly 'traversed unknown cities, visited new seas, were at home everywhere'. The love of roaming, which drove Hadrian through all his provinces, and urged him on 'to see with his own eyes all he had read of in any part', was very general. 'Despite the insecurity of human life', says the Epicurean Philodemus, 'many, and philosophers even, are fools enough to set aside so many coming years for studies at Athens, so many for Greece or barbarian lands'.

But this does not mean that there were then any voyages of discovery. The desire of exploring the unknown was weak in antiquity, and even fancy scarcely passed the limits of knowledge. At its greatest extent, ancient geography knew nothing of a third of Europe, or of Asia save the South-West, or of Africa save the North ; and even on the well-trodden frontiers of the known world, truth could not altogether banish fable, even amongst the learned.

No Columbus dared sail the Western Ocean, which, like the north, was thought, some way off the coast, impenetrable for ships ; and Strabo and Aristides thought a continent

between Western Europe and Asia possible, and Seneca thought that, in a few centuries, the ocean would cease to be an unsurmountable barrier, and a new Tiphys would discover lands beyond Thule.

But the Romans attained no more than this vague idea. The history of their navigation shows how little they understood nature as a study. The extent and the frontiers of the great Empire seemed to invite explorations on the high sea. The masters of the world possessed the Iberian, Lusitanian and Mauretanian coasts, yet scarcely knew of the Atlantic islands off North Africa. Some Andalusian skippers made Madeira (about 19,000 *stadia* from Africa), and described to Gaius Sertorius its soft warm climate, fertility and equableness; it was thought and called Homer's Elysium or the Isles of the Blest. Sertorius yearned to retire to this magic calm from the turmoil of war, but was prevented by his followers. No Roman ever after attempted to reach them. Yet the Canary Islands had been described by Juba of Mauretania, the greatest authority on Africa of ancient times (he married a daughter of Antony and Cleopatra), and by Statius Sebosus, a Roman knight of uncertain date. Pausanias obtained facts as to the satyrs from a Carian sailor Euphemus, who, on his way to Italy, had been blown out into the Atlantic, 'where no one sails'. His ship touched an island inhabited by satyrs. They were red creatures with tails, who, without uttering a sound, attacked the women in the ship; one was abandoned to them.

Between 480 and 450 B.C. Hanno the Carthaginian made an expedition of sixteen days beyond Cape Verde, but the knowledge gained became lost or dimmed. Strabo, for instance, denies the existence of the Isle of Cerne (? Agadir) discovered by Hanno. On the Guinea Coast Hanno was on two nights alarmed by the glowing grass and trees, especially near Sierra Leone, where he called the Sagras mountain the Chariot of the Gods. He landed at the Isle of Harang in the Bissão group, and there saw by day only forests, and at night fires, and heard flutes, cymbals, drums and voices: he left the island affrighted. His facts correspond with modern experience: the heat compels the negroes to rest all day, and conduct their noisy festivals at night. An author, followed by Pomponius Mela and the Elder Pliny, possibly

Cornelius Nepos, fused both tales into one fable. But Mela mentions, as his site, the coast South of the Mountain of the Gods, and Pliny the foot of the Atlas on the West coast. This fabulous range was towards the ocean wild and waste, and on the African side filled with shadowy fruitful trees and springs. By day no man was to be seen; the wayfarer sank into awed silence at the terrible sight of hills piercing the clouds and climbing up to the zone of the moon. At night there was a light of many fires and a din of satyrs and Pans, to the banging of cymbals and the sound of flutes. Pliny, confusing the Mauretanian Atlas with the mountains on the Bay of Bissão, apologizes for his vague and contradictory account by pleading the laziness of the Roman authorities in Mauretania: it had been held since 40 A.D.; there were five colonies in it, and the governors vied in penetrating as far as the Atlas. But their indolence in discovery did not prevent them from lying to conceal their ignorance, and such veracious and authoritative tales found ready credence. Suetonius Paulinus in 41 A.D. was the only Roman general who crossed the Atlas, and nothing resulted. He found the lower heights covered with forests of new, cypress-like trees (now called *ar'ar*), and the summits with eternal snow. Beyond the Atlas he marched through deserts of black sand, in which black, burnt-looking rocks rose up, uninhabitable even in the winter through heat, up to the river Ger (*gir* is, in Berber, flowing water), possibly the Wadi Sus, which flows into the sea South of Cape Ighir ($30^{\circ} 31' \text{ N. Lat.}$). He learnt of people who lived on dog-flesh in a region full of wild beasts, elephants and snakes, and obviously did not try to attain it.

In the middle of the Continent war and commerce pierced further south. In 19 B.C. Lucius Cornelius Balbus marched from Oea (Tripoli) through a people who lived in huts of salt-rock, and a long chain of black cliffs (now Harudj-el-aswad) into Phazania (Fezzan); he conquered many cities and tribes, and carried pictures of them in his triumph: amongst them, Cydamus (Ghadames) and Garama, the capital of the King of the Garamantes (the Tedas: on the site of the abandoned city of Djerma-Kadim, or Old Djerma). Cydamus ($30^{\circ} 15'$) was an ally of Rome and Constantinople until the Arab invasion. Under Justinian the natives were converted to Christianity: the place was permanently garrisoned; and an in-

scription of the reign of Alexander Severus has been found there. The Roman milestones extended, according to Barth, as far as $31^{\circ} 30'$ N. Lat. On the northern edge of the Hammada Barth discovered several Roman graves, two in good preservation, forty-eight and twenty-five feet high, probably the tombs of commandants of the Third Legion, there stationed. The southernmost of these monuments at Old Djerma ($26^{\circ} 22'$) proves the permanence of these Roman settlements. Pliny says, that the way to them was formerly unknown, as the 'robbers of this people' had covered the wells (discoverable to local experts) with sand, but, that after a war they waged against Oea, a road four days shorter had been found, called 'Past the Head of the Rock': probably because this straight westerly road passed by the declivity of the Ghurian at its steepest. Pliny repeats Herodotus on the Garamantes and Troglodytes of Aethiopia; the Garamantes pastured their calves backwards, and the Aethiopians ate snakes, and talked in hisses like snakes. The trade with both races was mostly in jewels, especially, even in Carthaginian times, rubies and garnets. Balbus, in his triumph, showed a picture of Mount Gyri, with a legend that jewels grew on it. Garama was the starting-point of two Roman journeys of discovery into Africa, of which Ptolemy tells. Septimius Flaccus from Garama in three months reached Aethiopia; Julius Maternus, of Great Leptis, also started from Garama, and, like modern Europeans, under the protection of a Garamantian chief, intent on Aethiopian booty, reached Agisymba in four months, 'where the rhinoceroses meet'; a country at least as far South as the watered valley of the Chad.

'The eternal riddle of Africa', the source of the Nile, Nero undertook to solve by a campaign in Aethiopia. His expedition 'went up the White Nile to the great reed-swamps at the mouth of the Keilak and Gazelle river, where the principal stream was called Kir. Amongst the negro tribes thus discovered were the *Syrbolae* (or dwellers on the Syr (or Kir, to-day Shir); the Medimni or Medin, the Olabi (or Eliab), Simbarri and Palugges (so-called by Aristocreon in Pliny, and by Brun Rollet the Barris and Poludjis).

Nero's explorers brought back tales of misshapen men, earless dwarfs with an extra mouth; but, at all times, the unknown becomes the fabulous. The White Nile up to modern

times has been the home of monstrosities, and the natives made up such tales to terrify the elephant-hunter.

Naturally, the East and India were ever being garnished by phantasy. Lucretius makes an impenetrable hedge of the ivory tusks of 'snake-handed elephants' completely shut India off: Virgil makes its trees loftier than any arrow could fly. Dio of Prusa describes India as a Paradise, on the authority of merchants who had visited its harbours, and little else. There streams flowed of milk and honey, oil and wine; the earth of herself gave nourishment to men; the meadows were aglow with flowers, the trees rich in shade and fruit; the birds sang sweeter than any instrument; a mild warmth lasted all the year round, and men, who knew not of disease, age or poverty, lived for 400 years. The people lived a perpetual festival, but the Brahmans devoted themselves to abstinence and contemplation and rigorous asceticism: they drink of the well of wisdom, one taste of which breeds everlasting desire.

And, on the farthest North, legend was persistent. The tale of a happy Hyperborean land of eternal spring, of a half-year day and half-year night, was half-believed in by Pliny. Tacitus says, that, in the North, there was a cold moveless sea of ice, the limit of the world: the sun sinks so near there as to fill the night with radiance and dim the stars, and its splash in the sea had been heard. But the tales of creatures with men's faces and animals' bodies he dismissed. Deme-trius of Tarsus, a learned friend of Plutarch, was commissioned by the Emperor to examine more closely the uninhabited islands scattered about Britain, of which some were called Isles of demons and heroes. He visited the one nearest, whose few inhabitants were deemed sacred by the Britons. A sudden squall ensued, and, he was told, a spirit of the mighty ones had gone up. On one of these barren islands lay Cronos, held captive by Briareus, and many spirits as his retinue. The idea of those coasts being the abode of the dead occurs later in various forms.

But travel generally was limited to a narrower part of the known world. Very few, excepting merchants ventured beyond the frontiers of the Empire. Strabo was of opinion that few geographers would have journeyed farther than he; from East to West he had gone from the East of Armenia

to the West coast of Italy, and from North to South from the Black Sea to the frontier of Aethiopia. Pausanias, on his long distant voyages (in Libya, Egypt, Arabia, Palestine, Little Asia, Greece, Italy, Sicily), had not met any one who had seen Babylon or Susa. On the Danube, in Trajan's time, except merchants and army-contractors, there were few strangers to be seen. In the Empire, journeys for pleasure or instruction were rarely made in the North, to which Tacitus' phrase in reference to Germany applied: that no one would quit Italy to see such countries.

But in the Western provinces travels for mere sight-seeing were common. Gaul and Spain were thoroughly Romanized, and possessed much that was attractive. Gaul was not Cicero's Gaul, but a land of charming scenery and cultured people. Publius Annius Florus, the African poet, after failing in the Capitoline *ἀγών* at Rome in 90 or 94, journeyed afar for distraction to Sicily, Crete, the Cyclades, Rhodes and Egypt, then across Italy by land to the Gallic Alps and the pale Northern peoples; thence Westwards to the Pyrenees, as awesome in their height and eternal snow as the Alps. At last he settled at Tarraco. In Spain Gades, where Posidonius stopped a long time, was a popular tourists' resort. Cicero says that to have seen the mouth of the Black Sea and the gulf, first entered by the Argo, counted for something, as did visiting that torrential ocean strait, which divided Europe from Africa. Aristides, too, designed sailing through the pillars of Hercules, but was prevented by illness. Besides the Temple of Melkarth, or Hercules, at Gades, a very ancient Phoenician building of cedar-wood, may have been an inducement.

Provincials, naturally, aimed first at Rome. Florus at Tarraco met some Baeticians who had just come back from Rome. But most Roman travellers went either to Italy and Sicily or South and East, to Greece, Little Asia and Egypt (after Augustus' reign), as the literature shows. These three countries Pliny the Younger calls nearest to the learned. Ovid (born 43 B.C.) had only seen Sicily, Athens and Little Asia. At his time it may not have been usual to visit Egypt (which was made a province in 30 B.C.). In 8 A.D., on his way to Tomi, in a poem he mentions it as a usual tourists' resort, but he was not, as erewhile, on the way to Athens or

Little Asia, or the regal City of Alexander, or the charms of the Nile. Many remarkable sights near Rome, says Pliny, are unknown, or only hearsay; had they been in some Greece or Little Asia, or Egypt or other tourists' country, they would have been visited. Hence, after Italy, these countries were the most frequented.

II. ITALY—VILLEGGIATURE ON THE COAST AND IN THE HILLS—BAIAE

Italy offered many charming little excursions. Seneca describes how short ramblings by sea and land may afford change of scene and allay weariness. The lusciousness of Campania might rouse a desire for the wilder landscapes and woods of Lucania and Bruttii. Sated with these barren regions, the traveller would go to Tarentum, and thence back to the Roman circus and amphitheatre.

But these tours of relaxation were only for individuals. For the mass, in the summer and early autumn all the roads were thronged with Romans, who left the sultry feverish city empty. As summer residences places easily accessible in the hills and on the Latian and Campanian coasts, and the Etrurian, were chosen. The leaders of the Republic had villas in such spots: Cicero had villas at Arpinum, his favourite one at Tusculum, and at Antium, Astura, Formiae, Cumae, Puteoli and Pompeii; Pompey at Alba, Tusculum, Formiae, in Falernium, Cumae, Baiae, Tarentum, Alsium, and others. And so, too, with leading men in the Empire. The Aurelii Symmachi in the fourth century had fifteen villas, partly near the City, partly at popular places on the Latin coast and in the Bay of Naples. Martial and Statius give lists of the principal summer resorts; there were always imperial villas at them. Of his own Augustus most frequented those on the sea or the islands of Campania (such as Capri), or in towns near Rome (Tibur, Praeneste, Lanuvium). When Martial was sending his fifth book to Domitian, he was uncertain whether the Emperor was enjoying the view of the lake of Nemi on the one side and the sea on the other from the Albanian heights, or was at Antium, 'where the smooth sea is so near Rome', or at Caieta, Circeii, or on the white cliffs of Terracina with their healthful springs. At Tusculum

there were at least four imperial villas, administered by a special procurator and staff, and at least forty private ones.

Thus, change of scenery was amply provided for, and every season or climate could have its villa. 'In Naples', Marcus Aurelius as Caesar writes to Fronto in 143, 'the weather is good but changeable. The nights are mild, as at Laurentum; at cockcrow, it is as cool as Lanuvium; at sunrise as cold as on the Algidus; the forenoon as sunny as at Tusculum; the midday as hot as at Puteoli; the afternoon and evening temperate, as at Tibur'. The Baiae season was in March and April: Nero invited his mother there for the Feast of Quinquatrus (the 19th-23rd March). In the height of the summer people went to Praeneste, Aricia, Tibur, Tusculum, the Anio, or Mount Algidus, a wooded range of hills extending from Tusculum and Velitrae to Praeneste. Many places (like Pliny's Laurentine villa) were suitable for summer and winter alike: Antium was visited not only in the hot season but in the rainy winter solstice: and the coast of Luna (Spezzia) and of the Maremma was protected by high cliffs, and moderate in both winter and summer. Places in South Italy, such as Velia and Salernum, were winter resorts; but Tarentum, the picturesque and remote, with its mild winter and long spring and generous nature, more so even than in Campania, was the great favourite.

Besides the Roman remains at these places, literature evidences the charm of these *villeggiature*. At Centumcellae (Civita Vecchia), according to Pliny's description, Trajan's magnificent villa stood in the midst of green fields, close on the coast, where a harbour was being built (106-7) and an artificial island of massive stone to dam the breakers and give a good entrance on both sides. Its stone front was then even rising out of the water, splashed by the tossing sea. Breakwaters were afterwards built up to the island.

At Alsium (near Palo), where Pompey, and later on Virginius Rufus (who died in 97), built a villa as a home for old age, there are ruins all along the sea some 450 metres in length, extending inland some 200 metres, with mosaic floors, marble walls, ante-fixes, lead water-pipes, isinglass panes; probably the remains of some imperial castles, separately administered. At this 'charming sea-resort' Marcus Aurelius rested for four days in 161 A.D., and Fronto in a letter gently reproached

him for working hard, instead of basking, sleeping in the sun at noon, sauntering by the shore, or rowing on the calm sea, listening to the measured beat of the oars, and at last, after the bath, feasting royally on mussels, fish and *frutti di mare* and other dainty fare.

At Ostia, a very lively place in the second century, where Varro mentions the villa of Seius, Gellius, one summer evening, was rambling with Favorinus and other philosophers, discoursing on the use of virtue to confer happiness; not many years later, perhaps for the feast of the vintage, Minucius Felix, the Christian, was walking there with a Christian and a heathen friend. They walked to the edge of the winding shore, where the curly waves bespattered their shoes on the sand, saw, where the beached boats were resting on tree-trunks, boys playing ducks and drakes, and at last sat down on the extremity of the breakwater that protected the swimmers, to consider the old and the new morality.

The shore from Ostia to Lavinium (Prattica) is now deserted; but then an intermittent row of country-houses lined it, a series of little towns. At Lavinium there was the villa of Pliny the Younger (of which there is a full description) and an imperial villa, into the cool laurel groves of which Commodus in 188 withdrew to flee the plague raging at Rome.

At Astura, on the island formed by the river Astura at its mouth, was a villa of Cicero's; surrounded by a dense wood, land and sea gave it an air of isolation, where grief might be indulged. It looked out on Antium, and the much-visited promontory of Circe. 'The blue rocky sphinx, visible from all parts, guards the entrance to the Paradise of the South from the Pontine Marshes.' There was an imperial villa there.

But Antium, on its long rocky promontory, was, in Republican times even, and yet more under the Empire, the queen of sea-cities, with splendid temples and palaces, invading the domain of the ocean, a favourite resort of the Emperors: Caligula and Nero were born there. From its palaces come many of the greatest works of art, the Belvedere Apollo, and the Borghese gladiator: its ruins extend over three miles; from the depths of the sea remains of this lost majesty emerge through the transparent water: far and near is the coast strewn with priceless pieces of marble, worn smooth

by the waves and covered with gravel (such as verde and giallo antico, pavonazzetto, etc.).

The bay of Terracina (the gulf of Gaeta) was also lined in with handsome sea-towns, with villas and country-houses in between. Martial once spent the early spring with his friend Faustinus at his villa near Anxur, when the earth was decking herself, and the nightingales were singing. He enjoyed resting there in the sunshine in his tunic, in the park, with brooks around him, on the firm sand on the river bank; with the sunlit heights reflected in the waters, and his bedroom overlooking the sea and the river (the canal that ran beside the Via Appia to Rome). On the Monte Sant' Angelo (Collis Neptunius) the ground floor of a Roman palace with a splendid view is still to be seen. Near Terracina, amongst other 'huge caves, with magnificent buildings in them' (Strabo) was the Villa Spelunca (Sperlonga) between the vine-clad heights of Fundi and the sea, where Sejanus, dining with Tiberius in a natural cave, saved Tiberius' life, at the risk of his own, as the roof fell in.

Next ranked the coast of Caieta, studded as it was with villas, and Formiae, where Martial's friend, Apollinaris, had a villa, enjoyed much more by the domestics than by their master. There a gentle wind stirred the surface of the calm sea and forwarded the gaily painted boat on. A visitor might fish from his bedroom window, lying on his pillows, and the fish-pond was stocked with the most expensive sorts. Sergius Julius Frontinus also had a villa at Formiae; and Symmachus calls the bay the abode of the Graces. Minturnae on the Liris, with the grove and temple of the nymph Marcia, was the residence of Apicius the glutton; and Castricius Firmus, the honourer of Plotinus, also had a house there. On the coast between Cumae and Misenum was the villa of Servilius Vatia, which was described by Seneca: its ruins are still to be seen, with two artificial grottoes, one of which never sees the sun, and the other sees it all day, and a canal from the sea through a plane-grove leading to the Lacus Acherusius, in which fishing went on when the sea was too rough. The pleasures of Baiae without the disadvantages could there be had.

But recreation and distraction was mostly found in the Gulf of Naples, under the great crater, even in the late

Republic. The road from Misenum to Surrentum was a pearl necklace of cities and villas, almost continuous: the choice of residence was immense. Statius, in his poem to his wife, mentions one part, bidding her leave Rome and come to his abode, where summer and winter were mild, and a calm sea, peace and quiet invited a leisurely life. For there lay Naples, the city of temples and columned public places, its theatres covered and open, where a periodical festival was held, ranking next to the Capitoline. There merriment ruled, and a freedom combining Roman dignity and Greek licence. The neighbourhood was a delightful one: one could visit the shore of Baiae, or the Sibyl's grotto at Cumae, or Misenum, or the grape clusters of Gaurus or Capri; from Capri a lighthouse vied with the moon: or the vineyards of Bacchus, and the heights of Surrentum, beloved of the other gods, or the healing waters of Ischia.

These places and others are often mentioned as resorts for relaxation. Many, like Virgil, were glad to leave the bustle of Rome for ever and live in Naples the peaceful and enjoyable, 'the city of idle repose', 'a Greek colony with Greek leisure, games, art and learning, down to the destruction of the prosperity and culture of Italy'. Others retired there after an active life, such as Silius Italicus, who owned several country-houses at Naples, richly decorated with statues and busts. The name of one of the villas has come down; Pausilypon (Sans-souci) has become the name of the hills between Naples and Puteoli: it belonged to Vedius Pollio, who used to feed his lampreys with fat slaves. The tunnel through it was cut by Cocceius at Agrippa's order. Seneca, one day, on the way from Baiae to Naples, chose the land-route, and escaped sea-sickness to suffer the oppression of the dust of this dark torchlit *crypta Neapolitana*. At Puteoli, a harbour town, a favourite place for building in Cicero's days, Gellius once spent his summer holidays with the rhetor Antonius Julianus, and there the great Greek grammarian Herodian composed his *Convivium*. At Misenum, Lucullus built a lofty villa with a view over the Gulf of Naples and the Tuscan Sea: the Emperors afterwards held it: Tiberius often stayed there, and it was there he died.

The opposite coast, before the first known outbreak of Vesuvius in 79 and its ravages, was quite different in appear-

ance. Except the crater, apparently extinct, the entire mountain was covered with fields and vineyards: the view from Capri, says Tacitus, was splendid, before the changes wrought by Vesuvius. Martial, writing in 88, says, that ashes now covered the finest vine presses; and on those heights, beloved of Bacchus, satyrs had danced, and the cities of Venus and Hercules had stood. Stabiae (Castellamare) was overwhelmed with ashes at the same time; its neighbourhood was used as a residence for patients on a milk-cure. The height of Surrentum must have been most richly garnished with villas: on the South-West promontory stood a temple of Minerva, after whom the Cape is named to the present day. Statius' description of the villa of Pollius Felix of Puteoli between the Capes of Surrentum and Massa, gives an idea of the beauty and splendour of these houses. The wine of this coast stood in comparatively high favour: besides Bacchus, Minerva, Neptune and Venus seemed to have been patron-deities: Virgil invokes Venus to aid him to finish the poem in glorification of her son.

Augustus received Capri from Naples in exchange for Ischia and adorned it with palaces. Tiberius stayed there eleven years (26-37 A.D.). He erected twelve villas, named after the principal gods: a few ruins remain; the fragments of his own residence, the villa of Jupiter, are less scanty: it was at the North End of the island near the foundations of the lighthouse mentioned by Statius. 'What a wonderful sight the beautiful island must have been, adorned with temples, arcades, statues, theatres, and parks and roads, and its heights with marble palaces.' The view from the villa of Jupiter over the whole gulf, and the Gulf of Salerno and the open sea was incomparable.

'Thus all the shore from Toscana to Terracina, from Terracina to Naples, and round the Gulf up to Salerno, was lined with marble palaces, baths, gymnasia, temples, a wreath of Roman splendour. Any one then walking along the beach, and seeing all these abodes of pleasure, competing with the towns, must have rejoiced at the magic of civilization. To-day, on this Elysian coast, there are only the weather-beaten keeps of the Middle Ages, built to guard against pirates.'

Naturally the coasts remoter from Rome, and less accessible, were not as much visited as the West coast: but

they were not left deserted. Scyllacium (Squillace—the Gulf of Squillace in Calabria) is described by Cassiodorus. The town lay grape-shaped on hills overlooking the bay, with views on the blue sea and green fields. It received the full light of the rising sun ; the winter was sunny and the summer cool : the fisheries were rich : Cassiodorus had a fishpond there. Out of the town, vineyards, cornfields and olive woods might be seen ; it was pure country. The excellent situation made many who came there to rest, visit it and occasion expense to the city council.

On the East coast, there were also magnificent pleasure-resorts and villas. Nero's paternal aunt Domitia owned properties at Baiae and Ravenna ; and he poisoned her to secure them for himself. At both places he built pleasure-houses, which were kept up to the days of Cassius Dio. A decision of Celsus the jurist (under Trajan and Hadrian) refers to a tennis-hall being erected in the Park of one Aurelius Quietus at Ravenna, and the repair of the heating-pipes : Quietus went there every summer. 'Altinum, a harbour, between Patavium and Aquileia was, in Martial's time, filled with villas like those at Baiae, and like the canals of the *terra ferma* at Venice : it was so beautiful that Martial wanted to die there, as Horace did at Tibur.' Probably, when Ravenna became a capital after Diocletian, the Adriatic coast was more and more sought after. Cassiodorus praises Istria, a region rich in wine, oil and corn, as the Campania of Ravenna, with its Baiae, more than one Avernus, fish-ponds and oyster-basins. 'The castles (*praetoria*) are strung together like pearls.' Off the coast, there was a chain of islets.

Of the mountains of Italy, both in the Republic and under the Empire, the Albanian and Sabine ranges near Rome were most used as country residences. On to the walls of the Roman villas were built medieval castles and town settlements, e.g. Frascati and Albano ; Albano was the camp of the Second Parthian Legion, before the reign of Constantine, and is built up of fragments of villas : Domitian's villa seems to have been near the Villa Barberina between Albano, and Castel Gandolfo. The wild banks of the Anio, also, were lined with country-houses, amongst them, Nero's palace at Subiaco.

Perhaps the most naturally beautiful was Tibur (Tivoli): its palaces were gorgeous—the villa of Manilius Vopiscus is described by Statius, and is an instance—but the huge villa of Hadrian was the most splendid: it had two wings, East and West, and other sections named after famous places, such as Canopus, Tempe; three centuries of spoliation and collection (since Pope Alexander VI) have not exhausted the works of art it contains.

BAIAE

Very many travellers started out by the Via Appia, which went straight over the Albanian Hills; and thence to Campana and Puteoli and Brundisium, Italy's two chief harbours: the fine busy road was also much used for shorter journeys. On it, the rich man, weary of the town, would drive in a frantic hurry to his Albanian villa, there to be bored and return to Rome. On it many a fine lady, with her retinue of men, as Propertius' Cynthia, travelled, ostensibly to do honour to Juno at Lanuvium; herself the great sight, driving her horses—as women frequently did; to the poet's disgust a rival of his was accompanying her, in a richly upholstered carriage with silk curtains, and two Molossians with collars leaping alongside. Or some upstart freedman might be showing his expensive ponies. Women also made pilgrimages with wreaths in their hair, and bearing torches to fulfil some vow to Diana at the wooded lake Nemi, 'Diana's Mirror'; there in the heat of the summer a great festival was celebrated, and water and land alike, day and night, glistened with torches. Young men, too, will have followed Ovid's advice, and availed themselves of this opportunity. The popularity of the spot is vouched for by a settlement of beggars, about the end of the first century, between the Vallariccia and Ganzano.

But now the 'Queen of roads' is a desolation; on both sides of it stretches the undulating green Campagna, with ruins of arches of *cloacae*, and here and there some dull house. Occasionally, a two-wheeled carriage with piled wine-casks rolls over the ancient stones, or the mounted shepherds of the Campagna drive their droves of sheep and kine, and the dreary song of the field-labourer echoes in the distance

And, beyond Alba and Lanuvium, the Via Appia hummed with life, for travellers streamed to Campania or the Gulf of Naples, a natural Lotus-eaters' land, to seek health, recreation or license. Baiae was the first of the pleasure-cities of antiquity, 'the golden shore of the Goddess of Love, the gracious gift of proud Nature'; her smooth shore was ringed in with green hills. There dwelt the Nereids. There were various natural springs, the hot sulphur baths, built over the springs, being most used. Baiae catered alike gorgeously for the cure of the sick and the pleasures of the sound; in it were many imperial palaces, and each succeeding monarch sought to outdo his predecessor. The most important coast buildings are represented on rough glass ware of the period of decay, with legends such as lighthouse, Nero's pond, oyster pond, the second pond, the wood, the park, probably intended as presents or souvenirs. Villas were built on the heights, or on the shore, or into the sea. They almost always had gardens, which were artificially laid out, and with their alleys of myrtles and planes and shorn hedges occupied much room. There were many shady arbours. A poet finds the place particularly well suited for meetings for Mars and Venus, as Vulcan was kept off by the waters and the Sun could not spy through the trees. A real country home, like that of Faustinus, the friend of Martial, with stacks of corn and vintages, herds of cattle and poultry-yards would have been exceptional at Baiae. The magnificent villas were a city in themselves, and continually extending. At least in the early second century, Old and New Baiae were distinguished (Hadrian died at the former on the 17th July, 117 A.D.). And, later, the town grew yet more; Alexander Severus erected palaces and other buildings, and laid out great ponds of sea-water; for 500 years it was the greatest fashionable resort of the ancient world. In Cicero's time the air was considered unhealthy in summer: the charge is not repeated. Possibly the further building removed the noxious influences; in the sixth century Cassiodorus mentions its salubrity. In time, desolation brought on malaria; but even in the Middle Ages the place was visited. In 1191 Alcadinus, the physician of Henry VI, describes thirty-one baths at Puteoli and Baiae. Petrarch calls this coast pleasant in the winter, but dangerous in the summer.

R.L.M.

Z

Boccaccio mentions the liveliness of the spot, and also its immorality. The baths were frequented in the fifteenth and the beginning of the seventeenth century; but Baiae was in 1538 destroyed by a subterranean fire.

In antiquity Nature and art vied to make Baiae unique. The incomparable beauty of the situation, the gorgeousness of the palaces, the luxury, the clear air and bright sky, all combined to make the moment delightful; and festivals followed on ceaselessly. On the gentle sea, countless light boats were swaying, sometimes a princely galley; and there were races. Parties were held on board, or on the shore, the guests wearing rose-wreaths; drunkenness was a common sight. From daybreak to sunset the shore rang loud with songs and music. Lovers whispered together on the shore, or were rowed about on the Lucrine Lake or Avernus, or sought the solitudes of the myrtle avenues above Baiae. The cool star-lit evenings induced feasts and outings, and sleep was disturbed by serenades, or rivals' quarrels. The life of Baiae was proverbially dissolute. Varro devoted a special satire to it; he says maidens were common property, and many old men became children and boys girls. Cicero feared ill-fame from visiting Baiae at a time of public misfortune. Seneca calls it the home of vice. Wastrels, whom insolvency had expelled from Rome, squandered their borrowed money here on oysters. Women were constant visitors: many a man, says Ovid, instead of a cure, got a wounded heart. Once, another poet says, the water at Baiae was cold; but Venus made Cupid swim in it; a spark from his torch fell in, and set it on fire: henceforth any bather there falls in love. For female virtue the place was not recommended. Many a love-entanglement, says Propertius, was here solved. Martial tells of a Penelope who arrived at Baiae, and left a Helena; probably not unprecedented. Gellius, and those who sought modest pleasures, preferred Puteoli. But, as Synmachus says, the neighbourhood was not implicated in this license: he lived there 'without songs on boats, without profligacy at banquets'.

III. SICILY

After Italy, Sicily was the nearest place for short excursions; the attractions were its natural wonders, Etna, the mild winter, the beauty and fame of its cities, both historical and legendary. Such was the tale of the Rape of Proserpine at Enna, a meadow so redolent with violets and scented flowers, as to throw hounds off the scent: after this sight, came the gulf out of which Pluto sprang forth, and the ancient Temple of Ceres. In Republican days, Sicily was a favourite touring resort: Cicero says there is scarcely ever a cloudy day. 'Most of you', he is addressing the jurors of Verres, 'have seen the quarries at Syracuse'. Ovid stayed there a long time with his friend Macer. He mentions as the principal sights Etna, the Lakes of Enna, the Anapus, the springs of Cyane and Arethusa, and the Palici; two little, deep, milk-coloured lakes out of which water is continually boiling forth with a strong smell of sulphur and a roar; there oaths were made, as perjuries of such oaths were instantly punished by the Gods. Near by was a richly decorated temple, an asylum for runaway slaves. Caligula, after Drusilla's death, found distraction in sailing along the coast of Campania and Sicily to Syracuse, and enjoyed the several sights, but fled from Messana in sudden panic from the smoke and rumble of Etna. The ascents of Etna will be mentioned later on. Seneca, speaking of the stages to Syracuse, says the traveller first sees the real Charybdis, which is only voracious under an East wind, and the spring of Arethusa, the poets' theme, with its mirror-like, ice-cold water; and next, the quietest and safest of all harbours, defying even the worst of storms; and then the place where the Athenian strength was broken, where the stone quarries with their enormous depth swallowed up thousands; and the huge town, bigger than the environs of many other towns; and the traveller enjoys a mild cloudless winter. Firmicus Maternus, the astrologer, composed his work in Sicily about 350 A.D., and, in the dedication to his friend Mavortius Lollianus, mentions the information on Sicily given by him to Lollianus when on a visit; on Scylla and Charybdis, the eruptions of Etna, the Lakes of the Palici, and whatever else he had read in Latin or Greek of the wonders of the province.

IV. GREECE

The next common mark was Greece. In Greece Rome revered the source of her civilization, and the land of ancient fame, with its glorious past of history and legend. 'Fame stays, but greatness goes', ran a Latin epigram, 'we seek the ashes of the fallen and in the tomb they are sacred'. In Greece, every inch of ground had its association; every step took one past some historical landmark, some monument of supreme art; her cities and temples had been ever visited since the Punic Wars. 'Most of you', Livy makes the Rhodian Embassy in 191 B.C. speak in the Senate, 'have seen the cities of Greece and Asia'. In the autumn of 167 B.C., Aemilius Paulus travelled through Greece to see 'things rumoured great, perhaps too great'. The Roman general visited the most celebrated temples (Delphi, Lebadea, Oropus, Epidaurus, Olympia) and cities (Athens, Corinth, Sicyon, Argos, Sparta, Pallantium, Megalopolis) and places memorable like Aulis, or remarkable, like Chalcis, with its dam over the Euripus: he was most impressed by Olympia, where Phidias' Zeus impressed him as a present deity.

Greece never recovered from its devastations by Rome from 88-33 B.C. Under Roman administration the country revived, and, under the Antonines, the province of Achaia had numerous villages and small towns and 100 larger cities. But some regions, like Aetolia, remained desert, and the more prosperous never reached the level of the Mithridatic Wars. A mere shadow of her former self, her decay seemed to allure Roman visitors all the more. The stillness and solitude enhanced the idea of her great past. Many of her cities were cities but in name, such as Panopeus in Phocis, once proud and populous, in Pausanias' day, a collection of huts, no palace or theatre, no ἀγορά, no gymnasium, not even a spring. In Thebes only the citadel, the *Kadmeia*, was partly inhabited, and called Thebes; of the lower city, only the gates and the shrines remained. At other places sheep fed in front of the Council Hall, and the gymnasium was ploughed over, a few marble statues jutting out, or mere pedestals, inscribed with the name of the lost figures. Many other cities were in ruins: the country was unpeopled: in the wildernesses, the traveller, like Dio

of Prusa, might meet herdsmen and hunters who had never beheld a city, knew only their own scattered huts, and, aloof from civilization, had the simplicities of primitive man.

But most travellers visited only cities rich in ruined relics of the past, or that had, under Roman rule, preserved or even increased their grandeur. The prosperity of Athens had been destroyed by Sulla; but in her calm desolation, she was peerless and beautiful. Ovid saw her in her greatest decline, and could imagine what she had been in the fullness of her days: envy, he says, must weep and grieve at the spotless splendour of Athens. Even the unartistic Roman was entranced at the magic of Pericles' Athens: after 500 years, its glory was undimmed: its youth seemed eternal. In the second century the city, which under Trajan was still sunk deep, received a kind of after-math of life. Hadrian built on the South-East a new 'Hadrian's city', centring round the colossal Temple of Zeus with its 120 columns: he also erected a library with 120 pillars of *pavonazzetto* and a gymnasium with 100 of *giallo antico*. His new water-works, from Cephisia to the new city, were completed by Antoninus Pius in 140 A.D. Herodes Atticus the sophist added further buildings, principally the Odeum at the foot of the Acropolis. Severus, afterwards Emperor, visited Athens as a legionary legate, 'for the sake of studies, the Eleusinian mysteries, the buildings and antiquity'.

Under Marcus Aurelius Aristides poured forth panegyrics on Athens and Attica. He calls Athens still the greatest of Greek cities and the fairest of all, beautified by Nature and by art. Nature gave her her harbours, her acropolis, and her soft breathing grace; her air, finer in the town than in the country, although all Attica may be known by the brilliancy of its atmosphere. Art gave her the greatest and fairest temples, the masterpieces of sculpture, and the best libraries, and baths and racecourses and gymnasia, all gorgeous: Athens outstrips all other cities, not only in her excellences, but in theirs as well. She lies like an island with a chorus of isles around her. The delight of seeing Attica may be known from merchants or others who constantly visit her, whose soul is uplifted and purified at the sight. The light there is stronger and fuller, as though

Athene, as in Homer, took a veil from the eyes of the comer : on all sides so much, so various beauty surrounds, that walking seems a dance of joy and the voyage a happy dream. Who would not admire the loveliness of the ground stretching from the Acropolis down to the town and the coasts, and partitioned off by the mountains ? Who would not wonder at the glory and charm of those mountains, whose bosoms contain the marble for thanksgivings to the Gods ? Thus the variety of Attica makes her a microcosm, a perfect harmony of land and sea and hill and dale.

Athens attracted the art-lover, the antiquarian and the scientist : Corinth, in her way, was equally seductive. Athens and Corinth differed much as did Rome and Naples of to-day : at Athens, calm and earnestness and the monuments of the past ; at Corinth the noise and bustle of modern pleasure. The situation of Corinth was even more beautiful than that of Athens. From Acrocorinth there was a view, to the North, over the Bay of Crisa to the snow-peaks of Parnassus and Helicon, described by Strabo. One hundred years after its destruction by Mummius in 146 B.C., Corinth was refounded by Julius Caesar as a Roman colony, *Laus Julia Corinthus*. As the residence of the governor of Achaia, it shone with new buildings, a colonnade from the harbour of Lechaëum to Acrocorinth, mentioned by Statius, a temple of Capitoline Jupiter and many others. Hadrian had a huge aqueduct built from the valley of Stymphalus in the mountains, and erected *thermae*. It lay on two seas and had two harbours, Cenchreae and Lechaëum ; the same wind would permit to sail into the one and out of the other : thus Corinth was a meeting-place for all men, and soon grew rich again, as a market frequented by Greeks at all seasons, a place for festivals, a real metropolis of Greece. In the style of its buildings and its population, Corinth was only half-Greek. The Roman element influenced life and manners, and spread gladiatorial contests and beast-fights all over Greece. The refuse of East and West also met at this point.

Corinth, too, received a panegyric of Aristides at the Isthmian Games in honour of Poseidon. It still was the city of Aphrodite, which, like Homer's belt of Aphrodite, concealed so much beauty, charm and love as to be irresistible, even to the strongest ; also the city of the Naiads,

whose springs bubbled up in all parts, and of the Horae but, above all, the Court of Poseidon, who set her floating in the stream of the world's wealth. In books, too, Corinth was also rich. In all parts gymnasia and schools were to be seen : foreign students also came, such as Galen to hear Numisianus the physician. Her legendary and historical fame was second to none.

After Corinth, the shrine of Aesculapius at Epidaurus was the spot most visited by Romans. Under the Emperors it gained new vogue. The sacred sanatorium was secluded by mountains, and walled off as well. Inside the demesne of the temple, 'the dense grove spread out and guests and patients lay in its shade. In it also were the various sacrificial buildings ; the huge ruins testify to its magnificence'. Antoninus Pius extended the conveniences, adding a mortuary and a house for births outside the holy ground, in which none might be born or die. This enclosed valley must have been one of the loveliest spots in Greece, with its decorated temples and banqueting-halls, between the wooded heights, studded as they were with shrines ; both a beautiful garden and a rich museum of art, filled with the monuments of the centuries of the fame of the Epidaurian God.

A catalogue of the more celebrated towns, their temples and works of art and treasures, their historical relics, would alone fill a volume : of these, beloved of the friends of art and history, mention will be made later. Aedepsos in Euboea was a pleasure-resort on the sea : it had hot sulphur springs, which are still in use, and was an assembly-place of Greece ; Romans also came there, as did Sulla. Aedepsos was liveliest in the spring. Residences with halls and reception-rooms were provided for the guests, and the baths skilfully laid out : land and sea made the banquets on the shore a rare enjoyment. Yet the license of Baiae did not obtain at Aedepsos ; the society and its pleasures were better. Now Aedepsos is buried beneath masses of yellow travertin, deposited by the laden springs, and piled up to a height of 100 feet, a ten minutes' ascent.

V. THE GREEK ISLANDS AND LITTLE ASIA

Most Roman tourists to Greece also visited Little Asia. The islands of the Aegean, desolate and the homes of banishment, could only make the voyager muse on mortality: he would not stay. Relegation to Seriphus, Pholegandros, Gyaros, mere rocks inhabited by fishermen, was the severest punishment: to be condemned to a larger or more hospitable island, such as Andros or Naxos, was a mitigation. Only to visit a friend in misfortune, or to recall the scene of a past exile, would travellers put in at these rocks. When Musonius Rufus was banished to Gyaros, many Greeks sailed there to meet the great philosopher, and, afterwards, to see a spring he had discovered on the waterless island. In a cave in Pholegandros, amongst the names inscribed are some Roman.

Delos, too, once so populous, which was created a free port, as the centre of the trade between East and West between 168-88 B.C., had been ravaged by Menophanes, the general of Mithridates, and never recovered. The Romans restored the island to Athens, who possessed it down into the Late Empire: Pausanias found it depopulated, save for the guard round the temple. Yet Romans, travelling to Asia, like Cicero in 51 B.C., must often have landed there. At Delos the sites of history and legend were visited; the palm seized hold of by Latona, at the birth of Apollo, still shown: Ovid mentions two of them which he saw. And the shrines with their pillared halls, their sacred gifts from kings, the famous horn altar (built by Apollo as a boy) and the statues would all be seen.

Of the larger islands, Chios, Samos, Rhodes and Lesbos would be the most sought: Cicero exalts Mytilene, the capital of Lesbos, as a city, beautiful in its regularity, its architecture and its environs. Agrippa retired to Mytilene to avoid any suspicion of thwarting Marcellus, the Emperor-designate: in 32 A.D., Junius Gallio was not allowed the easy exile of Mytilene. A Roman villa in Lesbos has been discovered in an excellent situation. 'The thick woods, the refreshing sea-breeze, the view of the bay and heights of Asia and the healthy climate, made the island enjoyable, and Mytilene a beloved abode of the Romans.'

But Rhodes, the capital of which was the most important town in Greece, was the main objective of the Romans. Rhodes the splendid, as Horace calls the town, according to Strabo, was unrivalled by any other Greek city : in Vespasian's time, it was the most populous and prosperous in Greece, until the earthquake of about 150 A.D. shattered it utterly. Aristides in a speech warm with the immediate awfulness of the catastrophe, says that the greatest city of Greece has been smitten with the greatest of blows. Just before he had seen her, as splendid, as in her thalassocracy, as new, as if just built, and worthy of the name of the City of the Sun-God. Her harbour was crowded with ships from Ionia, Caria, Egypt, Cyprus and Phoenicia, and the breakwaters extended far into the sea, and her dockyards were from afar like vast fields of swaying corn : the triremes, trophies of ships' heads and other memorials of ancient victories, recalled her freedom and greatness of old. The city rose up in a semicircle from the shore : it had been built in 404 B.C. by Hippodamus of Miletus. Her acropolis was full of gardens and parks ; her streets broad and straight ; the architecture uniform. The strong walls, with their high and beautiful towers, were a special feature, and a landmark at sea ; the space within them so filled that they seemed to wreath the city in. Her temples and shrines teemed with statues and pictures : Rhodes was the only town that escaped Nero's artistic ravages. According to Licinius Mucianus, the town (like Athens, Delphi and Olympia) had 3,000 statues. ' Even after the earthquake', Aristides expatiates, ' what was left of her sculpture would sate many other cities'. Further, the scenery and climate of the island made an acceptable abode to the Romans. Tiberius lived there for seven years, and studied astrology. His house, like the Villa of Jupiter at Capri, stood on a cliff sheer over the sea, from which he used to hurl any companions he suspected. Nero, too, when pretending to abdicate, in order to evade Agrippina's regency, selected Rhodes for his retirement.

In 18 A.D. Germanicus made an unusual tour from Athens through Euboea and Lesbos, the coast of Asia, Perinthus, Byzantium and the Propontis and the Pontus : he was carried by zeal ' to see the places of ancient fame' : but contrary winds prevented him from seeing Samothrace on his

return. The Northern coast and islands were left alone by most voyagers, but 'Ilion, the mother of Rome', was not missed.

Ilion, a small city of Aeolian Greeks (now Hissar-lik, the palaces) was altogether inconsiderable, until the Roman occupation of Asia, a mere village without walls or tiled roofs: but the reputation of being the ancient Troy had never been contested: the inhabitants declared they were descended from Trojan refugees. Pallas Athene, to whom Hecuba and Andromache had prayed, was the patroness of the new town, and Xerxes and Alexander had made sacrifice to her: Alexander was shown, in her temple, the lyre of Paris and the armour of the heroes of the Iliad. The Romans accepted the tradition, and made their mother-city the mistress of the whole coast, immune from taxes, and generally favoured it. Thus privileged, Ilion prospered. In 85 B.C. Fimbria the Marian took Ilion the Sullan city by treachery, demolished the walls and burnt the city down, including the temple of Athene. Even Agamemnon, says Appian, did not do her as much injury: for not a temple or house or statue was left standing: it was asserted that the statue of Athene alone remained unscathed. Sulla gave some privileges to the Ilians; Julius Caesar was very benign to what he deemed the cradle of his race. He increased its territory and confirmed its independence and immunity. In 26 A.D. Ilion and ten other Asian cities vied for the honour of erecting a temple to Tiberius: Ilion preferred her claim as the mother-city of the Julii, but was refused, as only possessing the authority of unquestionable tradition. In 53 A.D. Claudius made Ilion immune from further obligations, especially from contributing troops. Her advocate in the Senate was Nero, then sixteen years old, who affirmed the descent of Rome from Troy, and the Julii from Aeneas. A rescript of Antoninus Pius confirmed its freedom and immunity from the guardianship of non-Ilian children, alleging the fame of the city and Rome's ancestry. This belief was official and general.

A scientific assault was now delivered on the fame to which Ilion owed her new prosperity. Demetrius, a famous philologist, and Hestiaeus, a critic of Homer, contested the identity of Troy and Ilium; asserting that Troy lay thirty *stadia* away

at the 'Village of the Ilienses', now Bunarbashi. Both of them came from neighbouring cities, Skepsis and Alexandria Troas, and may have been actuated by local jealousy : but the attack was dangerous, as coming from the centre of Greek learning, Alexandria. The learned world welcomed this view, and Strabo confirmed it : but it scarcely spread in Greek cultured society, and did not obtain any footing in Rome, whose reverence for Ilium was too deep-seated. Romans loved making pious pilgrimages to every classic spot in the town.

And the inhabitants satisfied this pious erudition. Conscientious tourists, 'crammed with the local antiquities', no doubt, went with their guide outside the town, on to the plain and the sea, to view every place of combat. They were shown where both hosts had encamped ; where the Greek ships had lain, and every other spot in the Iliad, such as the fig-tree (according to Strabo, a desolate part with wild fig-trees), the beech, the monument of Ilus, and so on ; the cave in which Paris delivered judgment, which Diodorus calls 'godly'. The graves of the heroes who there fell or died were also shown : and, to prove that Anchises was buried at Mantinea, Pausanias says his grave is not shown by the Ilians. At the tombs of Ajax at Rhoeteum, and Achilles, Patroclus and Antilochus at Sigeum, the Ilians offered sacrifice, as, no doubt, many travellers also did, e.g. Caracalla at the grave of Achilles, and Apollonius of Tyana (according to Philostratus). At the tomb of Protesilaus stood the trees which always withered when high enough to catch a glimpse of Ilium and then grew anew. The statue of Pallas, which fell from Heaven and was stolen by Diomedes, the Ilians could not exhibit : it was at Rome, as one of the evidences of the truth of the legend. Other relics were anvils which Jupiter had hung on to the feet of Juno, preliminarily to punishing her.

In Lucan's poem Caesar visits the district after the battle of Pharsalus : the poet, whilst staying at Athens, may have made an excursion out to Ilium and incorporated his impressions. According to him, barren woods and decaying trunks rooted in the palaces of kings and the temples of gods : Pergamus lay lost in a wilderness of shrubs. He saw the rock to which Hesione was bound, and Anchises' room

in the jungle; the cave in which Paris judged the goddesses; the spot at which Ganymede was ravished by the eagle; the rock on which Oenone, the nymph, used to play: no stone without its name. He carelessly stumbled on a dried-up brook, the Xanthus; and walked heedlessly in the high grass and was warned not to disturb the ashes of Hector. A few scattered stones: no sign of a shrine; but his guide said it was the altar by which Priam fell.

This coast of Little Asia abounded in attractive scenery. Ionia excelled the climate of Greece. The famous ancient temples were here: at Colophon, which Germanicus visited in 19 A.D. to consult the oracle, and at Ephesus and Miletus; also the fairest cities, all generously provided with the modern splendours, and baths in especial. Ephesus and Smyrna were the principal of these: they are mentioned by Dio of Prusa, with Tarsus and Antioch, as models for his native Prusa: probably they were the most visited by travellers. Ephesus was a rich commercial town in Asia and the treasury of the country; under the Romans the capital of the province and one of the most populous and beautiful cities of the world.

But, in Strabo's time, Smyrna had the fame of being fairest of them all, although the streets were dirty and had no drainage. This defect was remedied later, and the city was enlarged and embellished in the first two centuries, and earned its title of the 'first city of Asia in greatness and beauty, the most splendid and the metropolis'. Lucian calls Smyrna the finest of all the Ionian cities: Philostratus the most beautiful under the sun: it was generally designated in inscription as 'the beautiful', as Aristides, who described it before the destructive earthquake of 178, called it. It rose from the sea like an amphitheatre; the view from all points was magnificent, from the top there was a panorama of the sea, the suburbs and the town. From within Smyrna was even fairer. The charm was so great that she seemed born, not made. Gymnasias, public places, theatres, temples and their precincts abounded; baths in plethora; walks, covered and open; wells and springs for every house and in excess; the streets as broad as the squares and straight, at right-angles, with marble pavements, and two-floored arcades. There were also schools of all sorts, native and

foreign; a superfluity of fighting-contests, spectacles and other distractions; an eternal competition between the art of man and the art of nature: the climate fine; in both spring and summer cooled by the Westerly wind: a city, suited to both nations (the Greek and the Roman), for work and for leisure. Scholars from all three continents came to her schools. Scopelianus, a famous sophist of the end of the first century, selected Smyrna (according to Philostratus) as his best centre; for Smyrna was the chief muse of all the Ionian cities, the bridge on which their strings were set. Great teachers in all sciences were always at hand: Galen, in his twenty-first year (151), went to Smyrna, to hear Pelops, a pupil of Numisianus, and the Platonist Albinus.

VI. EGYPT

The accessible province of Asia might be the starting-point for travels East and South, aiming at pleasure and experience, rather than knowledge. Cyprus was usually regarded not as a touring-place, but as a stage on the way to Syria or Egypt: Titus in 70 A.D. on his road from Corinth to Judaea visited the Temple of Venus at Paphos. He saw the pointed pillar, that represented the goddess, the reliquaries and the offerings of kings and 'all the attribution of the Greeks to their beloved antiquity', and consulted the oracle. In the first centuries but few travelled to Syria, Phoenicia and Palestine, save for business or officially: the curious sights did not compensate the long sea-voyage: before the third century very few Romans or Greeks visited Hierosolyma, which Pliny, after Agrippa, calls the most famous city of the East. Pausanias, exceptionally, had been there and on the Jordan and the Red Sea. Antiochia, the splendid capital of Syria, is mentioned as infrequently in the literature of the first two centuries as Alexandria is frequently: the Elder Pliny only mentions it twice, on Greek authorities, for geographical and botanical purposes.

But crowds went every year from Italy and Greece to Egypt, which had a constant service with Italy in the shipping season. The regular boats went from Alexandria to Puteoli; and from Puteoli to Rome direct, after Domitian's connexion of it with Sinuessa, was only 141 (Roman) miles. Puteoli

was the harbour of Rome after the silting up of Ostia down to the completion of the new port *Portus* by Claudius and Trajan. A Greek poet under Augustus and Tiberius, Antiphrilos, asks why should Puteoli need such huge breakwaters? The answer is, to contain the fleets of the whole world; in comparison with Rome it was small. Similarly Statius designated this coast as the hostel of the world. Of the ornamental glasses engraved with pictures of Puteoli, and taken home by visitors as keepsakes, two have been preserved (in the mines of Odemira in the Portuguese province of Alentejo and at Piombino): the *pilae* of Puteoli are represented as twenty-five with twenty-four arches: sixteen columns are still left, the so-called Bridge of Caligula. By land they were approached through a gate. Seneca describes all Puteoli streaming out on the breakwaters to meet the Alexandrian corn-ships, and all Campania eagerly hailing the *tabellariae*, or post-ships, that preceded them, with their easily recognizable flags; for they alone, after passing the straits between Capri and the weather-beaten promontory 'whence Minerva gazes down on the waters' (Cape Campanella), might hoist a topsail: all other ships had to lower theirs. The silent harbour of Pozzuoli of to-day was then quick with masts from all Mediterranean lands. The inscription of a *sevir* of the *Augustales* at Lyons points to direct intercourse between both ports: he was a freighter at Puteoli: Strabo shows the enormous extent of the trade of Puteoli and Ostia with Spain in corn, wine, oil, wax, honey, pitch, scarlet and red lead, equal to the African trade. According to Philostratus, ships sailed from Puteoli to Africa, Egypt, Phoenicia, Cyprus, Sardinia and beyond. The wharves at Puteoli, in the late Republic, were a profitable investment. In them lay corn from Africa and Egypt, oil and wine from Spain, iron from Elba (this last was collected at Puteoli and other harbours on the West Coast and manufactured; and then exported everywhere), and other raw products of the West, besides Alexandrian stuffs, such as linen, carpets, glass, paper, incense, etc., and the costly wares of the extreme South and East, which passed through Alexandria. An inscription at latest of the Early Empire was put up by merchants who traded with Alexandria, Asia and Syria. Augustus, in his latter days, was once passing by this port, and to his delight received homage

from the crew of an Alexandrian ship: he gave each man forty pieces of gold, on condition of spending them only on Alexandrian goods. Many inhabitants of Puteoli may have been like Gaius Octavius Agathopus, who says he is resting there after many wearisome journeys between the West and the East. There was a strong oriental element, Greeks and Jews and Egyptians and Syrians, and permanent colonies and agencies from the great commercial cities of the East, such as Hierapolis, Berytus, Tyre and many others, with their local worships. On the pedestal of a colossal statue of Tiberius, fourteen cities in Asia are represented, which Tiberius restored after an earthquake in 17 A.D.; Ephesus, Sardes, Cybara, etc.; the *Augustales* of Puteoli, who erected the statue, either came from these towns, or had commercial relations with them. The voyager to the East might anticipate the East in this motley harbour of all peoples and tongues, with their various costumes and wares.

In the shipping season Alexandrian ships of all sizes must have been lying at anchor, from the light swift-sailing vessels to the vast cargo and corn-boats, such as were also built at Nicomedia. Lucian describes such a ship, which was driven by storm into the Piraeus and attracted a curious crowd. The *Isis*, a three-master, must have been 180 feet long, 45 feet at its broadest, 40 feet deep, and had a tonnage of 1,575: she must have been a large ship (which varied from 800 to 1,500 tons), have earned her owner twelve Attic talents a year (£2,829 3s.) or more. She was painted, had on each side of her bow a picture of Isis and other decorations; the visitors, who had never seen anything of the kind before, were taken all over the vessel, and wondered at the masts and sails, the cordage, anchors and windlasses, and deck-cabins, and stared at the tanned sailors with a foreign tongue who clambered fearlessly aloft. Egyptian steersmen were reputed the most seaworthy, and were the most sought after. Aristides puts 1,000 as the largest number an Egyptian ship could hold. The vessel in which Claudius returned to Hadria after subduing Britain was rather a floating palace.

And the biggest corn-ships were smaller than the vessels specially designed for the transport of marble and obelisks. Such was the *Acatus*, the first Alexandrian ship to land at

Ostia under Augustus, carrying the obelisk subsequently re-erected in the Large Circus, now the Piazza del Popolo. Augustus had this monster exhibited permanently in the docks of Puteoli; but, by Pliny's time, it had been burnt down. It is said to have carried 1,200 passengers, the obelisk, and a cargo of paper, nitre, pepper, linen and 400,000 (Roman) bushels of corn. But the greatest marvel in ships, according to Pliny, was the one built, at Caligula's order, to import the obelisk destined for the Vatican Circus (now on the Piazza di San Pietro), and four blocks of the same stone to serve as the pedestal. As ballast it carried 118,750 bushels of Egyptian lentils; its mainmast required four men to span it; it covered almost the whole of the left side of the harbour of Ostia; and Claudius planted three towering piles of mortar on it, to sink it. The ship which brought the obelisk set up by Constantius in 357 in the Great Circus (now on the Piazza del Laterano), according to Ammianus, was gigantic, and employed 300 rowers. Modern times only have surpassed these huge transport ships of antiquity. In the forties even, ships of 1,500–2,000 tons were admired. But the *Persia* (1856), 390 feet long, 45 broad and 83 deep, had a tonnage of 5,400; the *Great Eastern* was 680 feet long, 83 feet broad, took 4,000 passengers besides the crew, and 5,000 tons of cargo.

The average voyage from Puteoli to Alexandria with a good wind was at least twelve days; nine, according to Pliny the Elder, the fastest. An official paper document at Arsinoë is dated the 11th January, 193, by the year of Commodus, whose murder on the 31st December, 192, at Rome cannot therefore have been known. Egypt was to the Romans much farther than America is to us. The route was by Sicily and Malta. Malta, according to Diodorus, was prosperous and had good harbours (as had also Gaulus and Cercina): it was 800 *stadia*, less than a day, from Syracuse. St. Paul sailed from Malta to Puteoli in an Alexandrian ship, which wintered at Malta, 'the Dioscuri'; they stopped at Syracuse and Rhegium.

The lighthouse at Pharos irradiated 300 *stadia* (seven to eight geographical miles) on the dangerous coast of Egypt. It lit up the darkness like a star, and might be taken for one, until daylight revealed the shimmering white marble on the blue sea, and the palms on Pharos came into view. The

lighthouse, the administration of which in Roman times was entrusted to an imperial freedman, lasted on into the Middle Ages, and plays a great part in Arabian legends of Alexandria. According to Benjamin of Tudela (who died in 1173) there was a magic mirror on its peak, revealing hostile ships at a distance of fifty days: a crafty Greek had it shattered to pieces. The historian Makrizi (who died in 1456) says it was originally 400 yards in height: the lower half was square, of white freestone: the upper part octagonal, leaving a man room enough to walk round outside, and the top round. In 1303-4 occurred the last restoration known to history: in 1349 it was demolished: in 1440 its ruins might still be seen. Turkish misrule had removed every trace of it; and now there is no landmark, except in the West, the Arabian Tower, and towards Alexandria, clusters of palms and date-trees and the Column of Pompey.

To the Greek and the Roman visitor Egypt was a new world. The utter diversity of the land of the Nile was, if anything, more enhanced by the contrast with the increasing Romanized uniformity of the West, and the Greco-Oriental assimilation of the East. In Egypt, however, a mummified civilization subsisted, whose hoary years made Greece and Rome seem ephemeral, whose fossilized marvels and secrets stared living modernity out of face. Nature, too, attracted the curious. With awe did the stranger view the holy stream revered as a god, the most famous, who spread the boon of his waters so mightily as to be drinkable even in the sea. His unknown source aroused the spirit of exploration. Lucan makes Caesar at Alexandria say that to solve this riddle he would leave his Civil War. In Lucian's *Ship* Timolaus wishes for a magic ring, empowering him to fly far abroad into unknown parts and see the well-head of the Nile.

The swollen Nile in midsummer converted the whole of Lower Egypt into a lake, out of which cities and other heights arose like islands, and crossed by countless boats, hollowed-out trunks or of earthenware. In a passage written about the time of the annexation Virgil speaks of the blessed folk that live on the shores of the sea of the Nile, and sail on the land in gay boats. The flora and fauna impressed Roman imagination and were copied in mosaics and wall-paintings. On waters, thickly grown over with white lotuses, swamp-birds are seen swimming, or a hippopotamus lurking between

R.L.M.

A A

high reeds and bushy plants, or a lowering crocodile, an ichneumon creeping on the bank, a snake writhing along, an ibis with its bent beak preening its feathers, and palms overhanging, with their slim stems and feathery crowns, the thickets. Severus was attracted in Egypt by the strange animals and new scenery. The mosaic of Palestrina best illustrates the interest in the fauna: the upper half represents a barren tableland, containing animals fabulous and real; the lower half, variegated buildings on the Nile and men in them, is framed in with ibises, water-birds, crocodiles and hippopotami, which are being chased by huntsmen with lances from a boat. A dovecot suggests the commonness of doves in Egypt: in Upper Egypt, conical dovecots are a kind of upper storey to village-huts. Dongola is said to possess garden-houses like those in the Roman paintings of Egypt. The marvels of Egypt were often fabulous: Tacitus never doubted that the phoenix was seen there. Pliny tells of a palm-tree at Chora near Alexandria, which died and was reborn with the Phoenix, and adds, that, at the moment of writing, it had just borne fruit. The pygmies, which were another favourite subject, have been discovered to be existent in the dwarfs of Akka on the highlands near the equator. Philodemus the Epicurean states that there were pygmies at Acoris in Middle Egypt on the East shore. Egyptian architecture and districts were imitated: Hadrian in his villa at Tibur had a Canopus, and Severus apparently a labyrinth and a Memphis.

Nature and the monuments, colossal and ancient, were always alike wonderful in Egypt. Time has destroyed nothing of these artificial mountains of stone, the gigantic temples, the endless rock-passages and caves, the forests of colossi and sphinxes, the countless brilliant pictures and mysterious walls of hieroglyphics. The same new-old amazement has always attracted men. Modern buildings and pictures did not disturb the unity of these superhuman works, but copied the ancient styles.

Further, there obtained in Egypt many customs utterly strange and unique, such as artificial incubators (in hot dung), a practice that aroused the interest of medieval pilgrims on their way to Palestine, and is still carried on, especially at Cairo; or the mode of clambering up the palms—which

still subsists by slinging a rope round the body and the tree and in this sling making knots by which they ascended ; but, most of all, the strange worships, and, above all, the adoration of animals.

Thus the interest in Egypt has been perennial and identical : at the end of the third century (according to the author of the *Aethiopian Tales*) tales of Egypt ever found attentive Greek and Roman ears, and the listeners did not tire of learning of the pyramids, the graves of the kings and the marvels of this fairyland. Of the Emperors and their families, Germanicus travelled to Egypt in 19, Hadrian in 130, Septimius Severus with Caracalla and Julia Domna in 202 down to the borders of Aethiopia. Titus on his way back from Judaea in 70 visited Memphis from Alexandria : Caligula and Nero intended journeying there : Marcus Aurelius did, and probably Lucius Verus as well.

Alexandria, the capital, was exotic in Egypt. It was a comparatively modern town, built in Greco-Oriental style, like other cities of the Macedonian epoch, as their ruins in Little Asia, Syria and Cyrene show. Napoleon III, through the Court astronomer, Mahmud Bey, of the Viceroy of Egypt, in 1867 instituted excavations, which have thrown a new light on the plan of the town. The results were confirmed by the excavations of 1898-99. Mahmud's street-plan, of the fourth period of the city, though post-Hadrianic, followed the former plans. According to Mahmud the town inside the walls was 15,800 metres round or eighty-six *stadia* : in the 16,375 *milia passuum*, the highest figure among the ancients, the suburbs must have been included. The excavations have revealed a rectangular network of seven main-streets lengthwise, lying WSW. by ENE. and twelve breadthwise, lying WNW. by SSE. The central street lengthwise, which crossed the centre of the city, and led East to Canopus—perhaps called the Canopian Road, or the Corso or *δρόμος*, was the main-street all the way. Strabo says it was thirty-six metres broad ; as a fact, it was not quite twenty. On both sides, to mark off the carriage road, there were colonnades for the thirty *stadia* : traces are left of them. In the roads running parallel the pavement was only 6.65 metres wide. The main-street breadthwise also had colonnades, led from the Sun-gate to the Moon-gate, and had the same

width as the Canobian Road. The road was paved with blocks of hard stone, basalt and limestone, held in by continuous freestone. The twelve main-roads seawards all had covered canals. The stately houses of massive stones all had a supply of running water and flat roofs. According to Strabo the district of the Palaces, with its gardens, the Museum, and the Mausoleum, occupied a fourth part of the Greek city : the Mausoleum contained the body of Alexander the Great in a glass coffin, the gold one having been melted down by Ptolemy Alexander I. Of the many public buildings, the most prominent were the Gymnasium, with colonnades more than a *stadium* long, the Paneum, an artificial hill, mounted by spirals, giving a bird's-eye view of the town. Strabo only mentions the Caesareum or Augusteum incidentally : it was a temple put up by Cleopatra to Antony, and subsequently dedicated to the first Emperor : it may have been afterwards completed. Philo describes it as a great temple with porticoes, halls, libraries, parks, propylaea, full of offerings, statues and pictures and gold and silver. Strabo also passes by the Serapeum shortly : Hadrian, who decorated Alexandria anew, may have extended it. It was a columned court, with the Column of Pompey in the centre, and two obelisks in front : behind the halls were educational rooms, the library burnt down by the Arabs, and in front, a propylaeon with cupola. Ammianus says that, with its huge colonnades, breathing statues, and numberless works of art, it was inferior only to the Roman Capitol : in the *Description of the World*, written under Constantius, it is mentioned as unique.

In Diodorus' time, the census of Alexandria was 300,000 free citizens. After the Battle of Actium, the town prospered exceedingly, and its commercial and voluptuary advantages attracted immigration : hence in the first centuries the free population must have doubled, and the total been scarcely under a million. The town had to be extended : the desolate isle of Pharos (in Strabo's time), and perhaps the Heptastadion as well, was resettled ; and this new town was called Neapolis (a name found in two inscriptions of the second century). The population consisted of Egyptians, Greeks and Jews and a cross-race, mainly of Greeks and Egyptians. The Jewry in Philo's time was two out of the five districts (which

were named alphabetically), but also in the other parts, as their many-shaded synagogues might be seen in all parts of the town : the chief synagogue, according to Jewish authority, a magnificent building, was destroyed in Trajan's reign. Under Nero, the Jews (according to Josephus) were limited to the Δ district. Romans and other Europeans, apart from the strong garrison (which was recruited from the citizens and camp of Alexandria and contained few Occidentals) and the large officialdom, must have been constantly passing through or settling. Then, too, the universal trade brought Africans and Asiatics together from the farthest distances ; an unparalleled meeting of Aethiopians, Libyans, Arabians, Scythians, Persians, Bactrians and Indians.

The harbour of Alexandria was the only safe one on all of the long coast (5,000 *stadia* or 125 geographical miles) between Joppa and Paraetonium. At the mouth of the only waterway of an immeasurably wealthy land, midway between three continents, 'on the threshold between East and West and on the road to India', Alexandria was, as Dio of Prusa remarks, the centre of the earth, the market-place of the remotest peoples. This unique situation made Alexandria the commercial capital, and before the Empire, the political capital, to some, of the world. Later it was the second city after Rome, a rank challenged in the third century only by Carthage and Antioch. But the entry of Egypt into the huge domain of free trade ensured her the best results of her position. Trade instantly increased, and the Alexandrians were all gratitude for the annexation by Augustus ; put up the temple to him, as protector of shipping ; celebrated him, as Lord of Land and Sea, as Jupiter the Saviour, the Star of Greece, whom Jupiter the Saviour had set in the ascendant ; and the Alexandrian mercantile deputation which waited on him in his last days at Puteoli, entered, wreathed and clad in white, as though offering incense to a god, and exalting him as the author of their life, trade, pleasure, freedom and fortune. The imports from Arabia and India alone, six years after the Battle of Actium, was sixfold what it had been under the last Ptolemies ; then twenty ships went annually to India, and in 25 B.C. from Myosshormos no less than 120 ; from Central Africa imports also increased, and the market for the goods that passed

through Alexandria to Italy and the West must have enlarged with the spread of luxury and civilization in the first century. Caravans and trade-fleets, year in year out, brought treasures from the South and the East, from the farthest lands of fable. The greatest rarities of the world lay there amassed. Gold-dust, ivory, tortoise-shell from the land of the Troglodytes, herbs and scents from Arabia, pearls from the Persian Gulf, jewels and byssus from India, silk from China—all such goods, all of the utmost value, were transhipped hence to Rome, at 100 per cent. profit. In Strabo's time even, the exports exceeded the imports.

This universal trade provided livelihood and wealth to thousands, from the rich merchant, whose ships sailed to the Malabar coast and Puteoli, down to the navvies in the harbour. The looms of Alexandria furnished linen, sought after even in Britain, made from the native flax in various finenesses, and, in the exports to India and Arabia, the national taste of the customers was consulted. No less celebrated, even in the Middle Ages, were the wool-stuffs, with their gay designs, tapestried figures of men and animals for antimacassars, carpets and dresses. The glass-blowers sent out artistic and valuable glass-work in all colours and shapes: the papyrus-makers paper, thick and thin. A paper-manufacturer Firmus, under Aurelian, sought the purple, and boasted his paper would support an army. The oils and essences of Alexandria were also famous. In the incense-works the workmen, to prevent defalcations, had to work with sealed aprons and masks and thick veils, and to leave the shops naked.

This active bustle of industry contrasted with the leisured, unproductive turmoil of Rome, and, together with the medley of faiths and cults, natural to a great harbour, astonished Hadrian on a second visit to Alexandria. 'No one', he wrote in 134 to his brother-in-law Servianus, 'is idle here: every man has his work; even the gouty, the blind and sufferers from chiragra. Mammon is the god of the Jews, Christians and every one'.

The population was correspondingly haughty. Mercantile pride, the knowledge of the indispensability to Rome of the Egyptian corn-supply, were rife. 'If any one praises the Nile', says Dio of Prusa to the Alexandrians, 'you are

as proud, as though you flowed straight from Aethiopia'. Where wealth was prodigious, and millionaires abounded, where the proletariat easily earned enough to lunch on fresh or smoked fish with garlic, on snails, meal or lentils, or on giblest stew in a cook-house, and barley-beer to his satisfaction, luxury and license also prevailed. Egyptian sarcasm in Alexandria became unchecked impudence; emperors and benefactors were not immune, and danger scarcely mitigated the bitter wit. Dio of Prusa congratulates himself on facing the Alexandrians without fearing their so dreaded hisses, jeers and interruptions. Seneca was proud of his (maternal) aunt for being spared calumny for the sixteen years of her residence as wife of the governor of Egypt in a city 'so witty, and ready in abuse of the government'. Vespasian, despite his mildness, was on the point of punishing the Alexandrians for the contumely they showered on him, in consequence of the increased taxes imposed: they called him a salted fish-dealer. Titus interceded, and they cried out to Titus: 'We will forgive him; he doesn't know as yet how to play the Emperor'. 'I have granted this city', Hadrian writes to Servianus, 'all of its requests, its ancient privileges, and new ones as well: they were grateful, whilst I was here, but, as soon as I left, scoffed at my son Verus and Antinous'. Caracalla avenged their sneers in 215 by a frightful massacre.

In Alexandria, too, as Dio remarks, laughter and light-someness were universal, and earnestness and idealism nowhere. There, too, the only interest was *panem et circenses*. Alexandria, even in Strabo's time, had an amphitheatre, but (at any rate 100 years later) the racecourse and theatre were the most popular, and farces, jugglery, animal contests, and, above all, dancing and music were beloved of the people. The Alexandrians were thoroughly musical: the illiterate even detected a citharist's every false note. In wind and string instruments they were especially adept. Alexandrian music, probably a Hellenistic fusion of Greek and Egyptian style, soon became popular at Rome, and strongly influenced Greco-Roman style. According to Dio, vocal and string-music were an infallible sedative for tumult, and the voice and the cither cast a spell over the people. The racing events also led to affrays and fights.

The Alexandrian mob, as a harbour-mob, and as the motley

dregs of the most various nations and cross-breeds, was most inflammable, the least spark setting it on fire and creating a pandemonium in this city of luxury and delight. Demagogues would excite the many and large clubs (*θίασος*), in which, according to Philo, they vented themselves in orgies of drunkenness and impertinence. The slightest occasion—a greeting unreturned, a distress on the means of livelihood, the refusal of a trifling request, the unpopular punishment of a slave—and mobs collected, weapons gleamed, and stones flew; sometimes these uproars ended in mere street songs, but more often the troops had to be called out. In a description of the Empire in the fourth century, it is said that the governors walk in Alexandria in fear and trembling: popular justice is always ready to commit arson and hurl stones.

Religious fanaticism amongst the Egyptians often caused unrest. Diodorus himself witnessed an incident: a Roman, under King Ptolemy Auletes, unintentionally killed a sacred cat; the awe of Rome and the intercession of the king could not ward off his murder. Under Hadrian, the claims raised by different communities to a rediscovered Apis-bull at Alexandria provoked a tumult. Hadrian reasonably expected to find a commixture of Jewish, Christian and heathen practices; but the sects were also in sharp opposition of faith and race; and these animosities often induced persecutions, like that of the Jews under Caligula, described by Philo, and the conflict of Jews and Greeks in 66. On this occasion Tiberius Alexander, a Jewish renegade, the Praefect, to break the resistance of the Jews, had to make use of 5,000 soldiers, who were passing through, besides the two legions in garrison; 50,000 Jews are said to have perished.

Amongst the various tourists to this peculiar and splendid city, those in quest of health and those in quest of learning may be mentioned. A sea-voyage to Egypt was recommended by physicians to consumptives. The kindly heaven, from which never fell any snow, under which roses bloomed in the winter, and not a day passed without sunshine, where the summer was relieved by the monsoons, might well give some hope to the patient who found the climate of Italy too harsh. Also Alexandrian physicians and medical schools enjoyed the highest repute. Galen says—he studied in Alexandria—that, if only because Alexandrian doctors gave

their pupils actual limbs to handle, students should flock there. A contemporary physician mentions that he had often witnessed the swift and painless execution of criminals by adder-bites. At all epochs young doctors crowded to Alexandria, 'whence health went out to the world'. To have studied there was a recommendation.

The other sciences also had their best teachers and schools at Alexandria, much sought by strangers, mainly from Greek-speaking countries. To the last ages of antiquity, and even later, Alexandria remained a great school of philosophy, music, law, philology, literature, mathematics and astronomy (including astrology, alchemy, magic and occult science, in which Egyptians were the experts). The centre of this university was the Museum or Academy founded by the Ptolemies, and the library, in which countless scribes must have been always occupied, and spread calligraphy and shorthand.

Lastly, religious motives induced journeys to Alexandria. 'Nowhere', says the *Gazetteer of the World*, written in the reign of Constantius, 'are the mysteries of the Gods so well celebrated, now, as of old'. Serapis, the god so much revered, the great helper, attracted most of the devout. Severus valued his journey to Egypt highly, because he was enabled to pay his court to Serapis, and this was the pretext of Caracalla's visit in 215. Women from all parts of the Empire will also have flocked to the temples of Isis, the goddess most worshipped by their sex, and have filled their bottles with the indispensable and genuine Nile water.

Both to Alexandrians and to strangers, the East coast, with its famous pleasure and bathing-resorts, and, above all, Canopus, to the West of Abukir, was most attractive, and was thronged year in, year out. The banks of the three miles of canal between Canopus and Alexandria teemed with luxurious hotels. A Greek inscription of such an hotel (or perhaps a club) in elegiacs has been preserved in part. These walls, it runs, are always alive with feasts and young men: not trumpets, but flutes resound here; the blood of steers, not of men reddens the earth; clothes, and not weapons, deck us; wreathed choruses, goblet in hand, celebrate at night the god Harmachis. The 'Eleusis', an initiation into Canopian profligacy, had apartments for strangers,

with apparatus for distant views and every comfort : Canobus itself, a place made for pleasure, with the freshening sea-breeze, the murmur of the waves, and the sunny sky, seemed secluded from the world. At Canobus Apio, the Alexandrian philosopher, realized Homer's Elysium. Patients flocked to the famous Temple of Serapis, an especially holy shrine, to receive the oracles in their dreams. But most visitors went to Canobus to debauch ; the town was proverbial for the extent of the practice. Day and night in Strabo's time the canal was full of barques, with companies of men and women. Many of these boats had rooms in them and grated windows, and were overshadowed by the full Egyptian bean (the *Nymphaea Nelumbo*, now extinct, like the papyrus), and the joyous voyagers might be seen feasting amid scents and flowers, or performing lascivious dances to the sound of flutes. Representations of such scenes have been unearthed at Pompeii : the mosaic of Palestrina contains a banquet at which a female flute-player is playing, under a vine stretched across the canal alive with the blossoms of the bean.

But Alexandria and her excitements and spectacles could not allure voyagers like Germanicus who visited Egypt for its antiquities. From the modernity of the capital, a short journey inland on camels, or up the stream, took the traveller from the bustle and splendour to the awesome silence of dateless antiquity. There must have been many conscientious sightseers, like Apollonius of Tyana, according to Philostratus, who crossed from shore to shore, so as to miss nothing.

Most travellers aimed at Memphis next, not as being the second greatest city of Egypt, but for its ancient monuments. The palaces of the Pharaohs might be ruins, and the colonnades of sphinxes leading into the Temple of Serapis more than half buried under the sand ; but time could not sear the Pyramids. From a distance they could be seen lying towards the West on a desolate rocky plain, like hills amid difficult mounds of sand. Their appearance was then altogether different : the stone steps on all four sides were all covered with a smooth surface filled with hieroglyphs, terminating at the apex. The Arabian writer Abdullatif (circa 1200) says that copies of the writings on the two great pyramids would cover more than 10,000 leaves. The abrasion of this outer cloak took place only in the first half

of the fourteenth century ; a French pilgrim in 1395 found the process almost complete on the Great Pyramid : in 1440 Cyriacus of Ancona could climb up to the top. As late as 1638 (according to Greaves, an English traveller), the second was mostly intact ; and the third one (called the Red Pyramid by the Arabs) as late as the end of the fourteenth century. Natives, from the neighbouring town of Busiris, in antiquity practised the art of climbing the smooth incline, no doubt an exhibition for travellers' benefit : the Arabs did the same in the Middle Ages. The Egyptian priests averred that the depth of the Pyramids underground was equal to their height ; a legend told of Marienburg, and, no doubt, of many other extraordinary buildings. Greek and Roman tourists cut their names on to the vanished surface ; their inscriptions were seen and copied by pilgrims to the Holy Land in the fourteenth and fifteenth century. The sister of Gaius Terentius Gentianus, a high official under Trajan and Hadrian and consul, dedicated her inscription to the memory of her ' sweet brother ' : she had visited the Pyramids without him, wept for him and left this memorial of her grief. A number of other inscriptions on the claw of a huge lion with a human head beside the pyramid of Khafren were discovered, when the building was excavated.

Another objective was the ruins of Thebes, which stretched for two miles on both shores from North to South. Germanicus went there in 19, and perhaps had the first intuition that Rome might similarly disappear. The orientally coloured report states that, at his request, an old priest read out what was left of the hieroglyphs : the old Theban kingdom had once been as mighty as Rome and Parthia of that time. With a host of 700,000 men, the legend says King Rhamses II (1400 B.C.) had traversed and subjugated Libya, Aethiopia, and a great part of Asia : the various tributes of gold and silver, horses and weapons, ivory and fragrances, corn and other products were specified. To this day, in the ruins of Thebes, there are circumstantial pictures and records of Rhamses' wars and victories, and, in the tombs of his officials, lists of tributes, depicting the gathering of the silver and gold and ivory and ebony into the Royal Treasury : in one tomb the amount of grains on the fields from Kush to Naharain is given as 33,333,330.

The vocal statue of Memnon was also visited by Germanicus, apparently the most attractive object in all Egypt. On the West bank of the Nile was a great field of ruins, which Philostratus in his life of Apollonius of Tyana (possibly after the description of Julia Domna) calls the market-place of a deserted city, strewn with remains of walls and columns, stone seats and statues, destroyed both by man and by time. Out of this whirl of fragments, there towered up two seated colossi of King Amenophis III, visible four hours away. Each was hewn out of a rock sixty feet high, naked to the waist, with a youthful expression, upright, the arms close by the body, and the hands on the knees. Since an earthquake, possibly in 27 B.C., had thrown down the upper part of one of them, leaving only the knees and hands on the throne, visitors to Thebes might behold a strange sight. When at sunrise both colossi threw vast shadows over the silent wilderness, the fallen statue gave forth a note. Strabo, the first to report on it, calls it a slight noise, which might be caused by a tap. Others compared it to a breaking string, to a resonant copper vessel, or even with the human voice. Hence the idea arose it was a statue of Memnon, according to Greek tradition, the legendary builder of these palaces: and the son of the rosy dawn was greeting his mother. When this title of Memnon came into general use is not known: but Apio, the famous Alexandrian savant and charlatan (the author of the anti-Semitic pamphlet confuted by Josephus), has cut his name on it, and records eternally that he had heard Memnon three times. He lived under Tiberius and Caligula. The first author to designate this colossus as Memnon is Pliny the Elder in his *Natural History* (completed in 77 A.D.). As the musical statue of the son of the goddess of the rosy dawn the Colossus attracted Roman and Greek tourists. Of the many pilgrims to this sight, some have cut their names, occasionally the date, and other remarks, on to the legs, covering it almost as far as the knees. Of the seventy-two, thirty-five are dated. The first is under Nero, three under Domitian, one under Trajan, most (twenty-seven) under Hadrian: Hadrian's own name, his wife's, and those of several of his following record a visit in November, 130. There are also eight governors of Egypt, and two wives of governors, three commanders of the Thebaid, various officers, two judges of appeal, a priest

of Serapis at Alexandria, a 'Homeric poet' of the Museum, and so forth. The last dated inscriptions are under Septimius Severus. During his residence in Egypt in 202, he had the Colossus restored, a restoration which has lasted to the present day : but the pressure of the heavy blocks prevented the vibration at the sudden change of temperature at sunrise. The statue of Memnon was henceforth dumb, and very soon forgotten.

In many inscriptions, tourists record their worship of Memnon and prayers to him, often in the name of far-away loves, whom they would like to have by them, or in other fashions. The former is the commonest form of tourists' inscriptions in Egypt. They contain a supplication to the national or local gods of the country, under whose mighty protection travellers so far from home wished to be.

In Thebes, after the Colossus of Memnon, Greeks and Romans visited the Tombs of the Kings in the second Libyan range of mountains West of Thebes. The valley of Bab-el-Moluk was, no doubt, the same as now, a desolate home of the dead : 'not a bush, or blade of grass on the bald steep rocks, yellowish cliffs, bestrewn with sand and traversed by dark passages, the haunt of jackals and hyaenas within, and vultures without'. The Tombs of the Kings are rooms, vaults, passages and halls dug deep into the rocks : the Greeks called them pipes (σύριγγες). More than a hundred inscriptions have been found here, hastily scratched on by torchlight, or painted over red : they are mostly Roman ; those dated ranging from Trajan up to Constantius, and none anterior to the Ptolemies. Most of them are mere names and dates, or exclamations of amazement. 'Those who have not seen this, have seen nothing', runs one Greek inscription in the tomb of Rhamses IX : 'happy they, who have'. A high Egyptian official of finance (about the fourth century) remarks he has stayed long in Rome, and seen Rome and Egypt thoroughly.

Similar inscriptions are found at places on either bank, on temples, obelisks, πύλῳνες, and so forth, up to the frontier at Philae and Syene, and as far as Hiera-Sykaminos, the Aethiopian frontier and southernmost point of the Empire. Some are interesting ; at the ruins of Great Apollinopolis (Edfu) in Upper Egypt, 'Ptolemy, the son of Dionysius,

a Jew, praises God', 'Theodotos, the son of Dorion, a Jew, saved from' (there is a blank for some country): the travellers must have been Egyptian Jews, returned from a long and dangerous journey, and, perhaps, out of regard to pagan companions, giving the expression of gratitude a possibly pagan turn. At Philae, the name of Gaius Numonius Vala is hewn in: with him Horace once corresponded at leisure on the advantages, climatic or otherwise, of Velia and Salernum: he came here in Augustus' thirteenth consulate (2 B.C.) on the 25th March: eleven years later he was killed in the flight to the Rhine after the battle in the Teutoburger Wald.

Of the other tourists' sights in Egypt, only a few can be mentioned here. At all of the shrines the priests were the *ciceroni*. Aristides says that, on his four journeys to Egypt, he left no site unvisited, and measured any place he could not find in books with the aid of the priests and prophets. The priests also showed the holy animals, such as the immortal ibis, mentioned by Apio, at Hermopolis. Diodorus says that much might be told of the steer Apis at Memphis, the crocodile in Lake Moeris, the lions in Leontopolis, the goat at Mendes, the steer Mnevis at Heliopolis; but it would be incredible save to those who had seen them. He expatiates on the distinguished men who waited on them, fed them with the best food, gave them warm baths and scents, laid their splendid beds, got them wives and spent great sums on their burial: in his time, as much as 100 talents (£23,576 5s.). Germanicus also visited the steer Apis, which the priests kept in a special stable: Titus attended the consecration of one. The crocodiles knew the priests by their voices, were taught to follow them, and let them open their jaws, clean their teeth, and dry them with linen cloths: Suchos, a tame crocodile at Arsinoe, used to be fed by tourists with bread, wine, and flesh.

Of the great buildings, besides these mentioned, the labyrinth constructed under the erections in Lake Moeris, was a great attraction. The view of Elephantine and Syene just on the tropics, at the frontiers of Egypt, at the summer equinox was one of the wonderful natural sights. At midday, there was no shade, and obelisks, temples and men, everything that was upright shone in full sunshine: at Syene (Assouan)

there was a sacred spring (now vanished) at the bottom of which the sun might be seen, filling the water to the surface. The Little Cataracts of the Nile above Syene were also much visited. Here the stream at high water flows over a rocky island in the middle of its bed, and is calm on either side. When governors and great men came to see the waterfall, the boatmen rowed up the stream on the West beyond the cataract, and then let themselves be hurled back, without coming to any harm. Aristides, at his request, got a military escort from the Roman garrison at Syene, to force the boatmen to exhibit their skill, and himself joined them. The great cataracts in Aethiopia were seen but by few travellers. Similarly places too remote from either bank were scarcely visited: curiosity could not overcome reluctance to inaccessibility. Aristides went through all of Egypt four times without seeing the 'famous porphyry-quarries on the Red Sea' (now Djebel Dôchan), where, after Claudius' reign, hundreds of convicts worked in the waterless waste, and the scorching sun, to transform the hard stone into columns and decorations for the palaces of Rome.

VII. WHAT INTERESTED ROMAN TOURISTS

As to the places and countries visited by tourists, sources both Greek and Roman are equally available and applicable; but the objects of interest were diverse. Whether the Seven Wonders of the World as such attracted travellers to their sites is, in the absence of information, uncertain. They were certainly put together between 284-220 B.C., in the time of the *Διάδοχοι*, and probably at Alexandria, perhaps by Callimachus, before one of them, the Colossus of Rhodes, was destroyed by an earthquake. Their sites lay in the territory conquered by Alexander the Great, and in a circle round Alexandria; they were Olympia (with Phidias' Zeus), Rhodes and the Colossus, Halicarnassus and the Mausoleum, Ephesus and the Temple of Artemis, Babylon with the walls and hanging gardens, Memphis and the Pyramids. The Colossus of Rhodes was afterwards replaced (according to Martial by Apollo's altar of horns at Delos), and the number seven was thus kept up; yet there is no evidence that they were visited as the Seven Wonders. Pausanias, who travelled

much, had never met any one who had been to Babylon (of which then nothing but the walls remained).

Romans betrayed very little curiosity in the national customs of foreign peoples; because most of the tourist countries had been tinged to a large extent with Greco-Roman civilization, and, superficially, were not peculiar, and, secondly, because the past was thus more interesting to the Roman than the present. The object was, step by step, to trace the monuments and remains of antiquity, and, besides this historical aspect, to come to know as many remarkable sights of all sorts as possible, not so much from interest in them, but for their sheer fame, or literary notoriety, or for the sake of their rarity and strangeness. How far artistic interest did essentially, and interest in nature partly, contribute, is a matter which must be deferred to the end.

§ 1. THE HISTORICAL INTEREST

First of all travellers bent their steps to the temples, as best satisfying their cravings for sights and information. Even little towns, both in Greek countries and in Italy, possessed remarkable temples. Thus Marcus Aurelius writes to Fronto of Anagnia that it is a tiny old city with many ancient monuments, temples and ceremonies. The temples would be the finest buildings, the largest and often oldest and most famous, and command a good view. The interest they could awaken is shown by Philo's description of the great Temple of Augustus at Alexandria. It was situated on an eminence above the harbour, and formed a landmark; it was full of offerings, pictures and statues, and its huge precincts were garnished with colonnades, libraries, halls, parks, propylaea, open spaces, and everything decorative.

The precincts of temples often enclosed, besides numerous edifices, parks and preserves of sacred animals and birds; the visitor to them was 'regaled by the beauty of the many trees, the coolness of the canals and the purity of the air'. According to Lucian's description, the magnificent Temple of Aphrodite at Cnidos was surrounded by a park of fruit-trees, planted for their beauty, which bloomed well and afforded ample shades: they were myrtles, laurels, tall cypresses and planes; the trunks all ivy-clad, with vines and grapes pendant from them. In the shady arbour, amidst the hum of the grasshoppers, seats were placed for the banquets

of the supplicants. At the Temple of Apollo at Gryneum in Little Asia, according to Pausanias, there was a 'splendid park of fruit-trees and other trees delightful of smell or sight'. The Isle of Tenos possessed a remarkable temple of Poseidon, in a grove outside the town with ample provision for sacrificial feasts. Near the Temple of the Syrian goddess at Hierapolis, near the Euphrates and the boundary of Mesopotamia, there was a large park for the sacred oxen, horses, eagles, bears, lions, and other animals. Often flocks of sacred geese were kept near the temples.

Temples also abounded in dedicatory gifts and rarities, pictures, sculptures and treasures of art, for motives of piety, of safe deposit and exhibition. Augustus' gifts to five temples in Rome (that of Jupiter on the Capitol, of Julius Caesar, Apollo, Vesta and Mars Ultor), out of the booty of war, according to his own statement, cost 100,000,000 sesterces in all (£1,087,500). Pliny the Elder says that dedicating his book to Titus will enhance it, just as many objects gain value through consecration in temples. Libraries used also to be left in this fashion : temples thus became museums, not only for art but for history and natural science ; though necessarily chance collections, as embracing and large as modern galleries. The Temple of Apollo at Rhegium (Reggio) once received a legacy of a parchment bound in ivory, an ivory box and eighteen pictures. In shrines at Athens, Delphi, Olympia, Rome, not to speak of others, many of the most celebrated pictures and statues might be seen, and at Rome collections of cut stones. Pompey gave the gallery of gems of Mithridates to the Capitol ; Julius Caesar six similar collections to the Temple of Venus Genetrix ; Marcellus, the nephew of Augustus, one to the Temple of Apollo Palatinus. In Christian churches the tradition continued ; and in the Cathedral of Girgenti the so-called sarcophagus of Hippolytus has been preserved, and in that of Siena, the group of the Three Graces.

Natural freaks (as also in Christian churches, e.g. a cayman in Notre Dame at Cimiez) were usually kept in temples. There, according to Pliny, the hugeness of elephants' tusks might be learnt. In Cicero's time the largest examples were in an ancient temple of Juno on a promontory of Malta : according to the inscription, they had been stolen for King

• R.L.M.

B B

Massinissa without his knowledge, and by him restored; there were also masses of ivory, unworked and carved into figures of Νίκη in ancient style: Verres sacked them all. In the Temple of the Syrian goddess at Hierapolis, barbarian costumes, Indian jewelry and elephants' tusks were to be seen; all ascribed to the loot brought back by Dionysos, the supposititious architect, from India. Pausanias surmises that the tusks were bent horns, and confirms it by an elephant's skull he saw at the famous Temple of Diana at Capua. The skin and jaw-bone of a snake 120 feet long, killed by catapults by the river Bagradas in the first Punic War, under the orders of Regulus, were preserved in a temple at Rome down to the Numantine War. Hadrian gave an Indian snake to the Temple of Zeus Olympios he built at Athens, and the hide of a bear he had slain to his Temple of Eros at Thespieae. At the Temple of Isis in Caesarea, in Mauretania, in Pliny's time, a crocodile from a neighbouring lake was exhibited: it had been given by King Juba as a proof that the Nile sprang from that lake. Hanno the Carthaginian on the West coast of Africa found and killed three 'hairy savage women', which the interpreter called gorillas (they must have been gorillas rather than chimpanzees). Their skins were kept in the Temple of Juno Astarte, until the razing of Carthage. In the Jugurthine War, the soldiers of Marius lighted on animals like wild sheep, whose gaze was fatal, and called gorgons. Numidian cavalry soon laid several low, and Marius sent the skins to Rome, where they were treasured in the Temple of Hercules near the Ara Maxima on the Forum Boarium. Pausanias saw the skeleton of a whale at the Temple of Aesculapius at Sicyon. At Erythrae, in a temple of Hercules, horns of Indian ants were exhibited (they cannot have been marmots, as the word generally implies). A frequent sight in Greek temples, according to Pausanias, consisted of Indian nuts (probably cocoanuts), and reeds as thick as tree-trunks: Pliny saw the root of the cinnamon tree on a golden plate in a temple built by Livia on the Palatium, in honour of Augustus: in a temple of Aesculapius at Panticapaeum, a dish was kept, which had burst by the water freezing in it. The great crystal, which Pliny had seen, of 150 (Roman) pounds in weight, was given by Livia to the Capitol; as a sample of the black spectrous obsidian

Augustus exhibited in the Temple of Concord four elephants made out of it; Caesar bestowed a breastplate made of British pearls on the Temple of Venus Genetrix.

Curious vessels, instruments and works of art were also to be found in the temples; such as a leaden forceps in the Temple of Apollo at Delphi (showing, according to Erasistratus the physician, that only the lighter and more accessible teeth ought to be removed); or, at a temple in Smyrna, a distorting mirror; at Erythrae two *amphorae* of remarkably thin clay, made by a master and his pupil, vying which could make the finer vessel. Varro saw a flute with four stops in a temple of Marsyas, an obsolete instrument; and St. Jerome mentions a huge bronze ball on the Acropolis of Athens beside the Statue of Athene, used as a test for athletes competing in the ἀγῶνες: he was too weakly to move it. Foreign weapons and implements were also stored up in temples: in the temple of Aesculapius at Athens Pausanias saw a Sarmatian breastplate of horse-hooves, and linen breastplates in the Temple of Apollo at Gryneum and elsewhere. A bison's horn cased in gold, part of the booty of the war with the Getae, was given by Trajan to Ζεὺς Κάσιος at Antioch.

Freaks of Nature were also occasionally thus treasured up. The Pergamenes had bought a basilisk's skin at a high price, to protect a temple, which was decorated by Apelles, from spiders and birds. At Gnatia, Horace jeers at incense said to burn on an altar without fire; a superstitious Jew might believe such fables. St. Augustine tells of a candelabrum in front of a temple of Venus with a lamp, unextinguishable by wind or rain, and explains it as asbestos or the magic of some daemon inside.

Yet more common were objects of historical interest, relics of great men, of all ages. The sword of Julius Caesar, given to Vitellius, came from a temple of Mars. Vitellius gave the dagger with which Otho had killed himself to another temple of Mars at Cologne: Scaevinus, preparatory to his conspiracy, took a dagger from a temple of Salus or Fortuna, with which to kill Nero: Nero dedicated it to Jupiter Ultor on the Capitol. Varro saw the spindle and distaff of Tanaquil in a temple of Sancus, and a royal garb made by her hands, and worn by Servius Tullius, in a temple of Fortuna at Rome. In the

disused temple of Jupiter Feretrius Augustus could still view the linen breastplate which Aulus Cornelius Cossus had wrested from the King of Veii Tolumnius in single fight, and consecrated. The ring of Polycrates (with a sardonx) was exhibited at Rome in the Temple of Concord in a golden horn presented by Augustus. King Amasis of Egypt had granted linen armour to the Temple of Athene at Lindos in Rhodes, every cord consisting of 360 threads; Mucianus, the friend of Vespasian, saw it in tatters from centuries of handling. Delphi possessed an iron chair of Pindar. The armour of Masistius, who led the Persian cavalry at Plataeae, was kept in a temple at Athens, together with the sword of Mardonius, the genuineness of which Pausanias doubted. The lance of Agesilaos was to be seen at Sparta; the harness and lance of Alexander the Great at Gortys in Arcadia, and Mithridates' armour at Nemea and Delphi; a candelabrum in the shape of a fruit-tree, part of Alexander's Theban booty, and dedicated by him to Apollo at Cumae, could be seen in the Temple of Palatine Apollo at Rome: of four statues, which had supported Alexander's tent, two might be seen in front of the Temple of Mars Ultor, and two in front of the Regia (the dwelling of the Pontifex Maximus).

But the Heroes, celebrated in poetry, and taught of in the schools, were better known than the historical figures, and their relics more appreciated; the genuineness of them was equally accepted, for tradition ranked with history, even though fabulous in part. And of heroic relics, Trojan remains were the most common and the most valued. They were widely distributed: an egg of Leda, that hung from a temple-roof at Sparta, probably an ostrich egg; an *Electron* goblet given by Helen to the temple of Athene at Lindos in Rhodes, said to be the size of her breast; and the ship of Aeneas, preserved down to the time of Justinian at Rome; and at Geraistos in Euboea a ship dedicated by Agamemnon to Artemis: at Cassiope in Corcyra the petrified boat of the Phaeacians. The sceptre of Agamemnon, forged by Hephaistos for Zeus, was to be seen at Chaeroneia, and his shield and sword in a temple of Apollo in Sicyon's *ἄγρᾱ*, where also were the cloak and the armour of Odysseus, the bow and arrows of Teucer, the web of Penelope, the dress of one of the wooers, the rowing-poles and helm of the Argonauts, the

kettle, in which old Pelias had been boiled, the skin of Marsyas, and so forth. In a Lycian temple there was a papyrus letter of Sarpedon: Pliny is only surprised because Egypt then closed her gates on strangers, and papyrus was elsewhere unobtainable. But earlier relics there also were: in Phocis at Panopeus, remains of the clay, whence Prometheus made men, in front of a temple of Prometheus; these remains smelt like human skins: at Olympia an ivory horn of the goat Amalthea, who suckled Zeus; in the Temple of Samothrace cups consecrated by the Argonauts. The same thing might be seen at two places, e.g. the hair Isis tore out in agony at Osiris' death, at Coptos, and at Memphis. Two cities in Cappadocia lay near each other, both named Comana; at both Iphigenia's sword might be seen. The Heroes, on their wanderings, had left relics even in the Westerly lands; or they had arrived in some other fashion. In Gades a golden belt of Teucer was to be seen; at Circeii a goblet of Odysseus, at Capua the loving-cup of Nestor; at Beneventum, Procopius even saw the tusks of the Calydonian boar, slain by Diomedes, the legendary founder: they were three spans long. Even in barbarian countries, reminiscences of Greek legend might be found, brought there by Greek travellers, and clung to by the natives. Thus at the Isle of Meninx (Gerbi), amongst other relics, an altar erected by Odysseus; or, at the mouth of the Phasis Arrian saw an iron anchor of the *Argo*, with an appearance of modernity, despite its titanic size and ancient style. But an ancient stone anchor he accepted as credible. In the Caucasus he was shown the mountain on to which Prometheus was bound. In Procopius' time the city of Apsarus in Colchis lay in ruins; yet the natives exhibited the grave of Absyrtus, the brother of Medea. Joppa in Palestine was reputed the spot at which Perseus released Andromeda: the bones of a sea-monster furnished the excuse to the Greeks and to the Jews, who here placed the landing of Jonah; Scaurus transported these bones to Rome; but, in Josephus' day, the traces of Andromeda's shackles were to be seen, and in Pausanias' time, a blood-stained stretch of water, in which Perseus bathed after the fight.

Visitors stranded in a town without a host generally engaged guides (*περιηγηταί*) or explainers (*ἰεργηγηταί*) at the temples,

and, in Greece, in the smallest towns they did not fail. The certainty of their supply is evidenced by Lucian's *True History*, in which they narrate to tourists from the upper world the reasons of the punishments of the damned. Generally priests and temple-servants acted as *ciceroni*; official guides being only found at the largest and most frequented places. Occasionally these might be well-informed men, authors of monographs on their city's antiquities, like a physician and *περιηγητής* at Hermione; but most of them were mere parrot-guides. Their company, now and then required, might often be irksome, especially to cultured men and at places like Olympia and Athens, when they gabbled out their explanations and popularized stories, 'and gave directions as to the art of the place'. Pliny mentions a statue of Hecate: in the Temple of Diana at Ephesus in dazzling marble; the vergers warned tourists not to gaze on it too long. 'If', says Lucian, 'the legends were banished from Greece, guides would starve; for truth is unpalatable'. In one of Plutarch's shorter works a visit is recorded made by a company to Delphi. Nothing could induce the guides to abridge their commentaries on what all had agreed to visit: they read out loud every single inscription, but could not answer any question outside the official patter.

In Greece and Little Asia guides entertained tourists with anecdotes of the heroes, a more congenial subject to all, and more familiar to the educated than historical figures. Roman accounts of travel show this clearly. Pomponius Mela's reminiscences are more mythological than historical. In the *χωρογραφία* (now lost) utilized by Solinus, Nature and mythology are the two features. The lists appended to the itineraries of the archipelago, contain one isolated reference to white marble of Paros, and otherwise merely legend; the birth of Juno at Samos, of Apollo and Diana at Delos, the abandonment of Ariadne at Naxos, and the advent of Dionysus to save her. Greek legends localized in the East maintained themselves well, such as the Memnon myth at Thebes, the Prometheus myth in the Caucasus, the Argonauts at Colchis, and the Perseus legend at Joppa. Tacitus, in his curtailed account of Germanicus' journey in Egypt, does not omit the derivation of Canobus from Canobus the steersman of Menelaus; though Aristides learnt

from an Egyptian priest that the word meant 'golden ground', and had been used ten thousand years before the landing of Menelaus. Yet the tale died hard: Ammianus Marcellinus repeats it.

Both Greek and Roman tourists enjoyed being told on the spot the legends 'a people amorous of its past wove into its grey beginnings'. In the absence of ruins, even traces of antiquity were descanted on. As Aristides says, everywhere talk ran on the bygone: any nook must be the remains of a *τροπαῖον*, a monument, spring, the chamber of Helen or Harmonia or Leda. From the Troezenian Temple of Aphrodite Phaedra gazed down on Hippolytus, who was running on the course: and a myrtle with pierced leaves had been pierced by her in her misery with a hairpin. On this stone in the harbour of Salamis old Telamon had sat and followed with his eyes the ship on which Ajax was sailing to Aulis. At Aulis there was a spring by which the plane had stood, on which, before the eyes of assembled Greece, a snake devoured a sparrow and her brood of nine: a relic of the wood was preserved. Near Sparta, on the road to Arcadia, was a statue of Modesty, where Icarios had overtaken the chariot on which Odysseus was bearing away Penelope: Icarios repented him of his consent and besought his daughter not to leave him: Odysseus bade her choose between father and husband: she veiled herself. Icarios turned back: the statue marked the spot. It was a land where every stone had its saga.

The reminiscences of great men of later times were also sought: Roman *pietas* offered sacrifice at their graves. Thus, in 191 B.C., Manius Acilius Glabrio ascended Oeta, and sacrificed at the Pyre of Hercules. Caracalla imitated Alexander the Great, sacrificed at the tomb of Achilles at Ilium, and Trajan at the house at Babylon where Alexander died. Hadrian restored the grave of Ajax at Troy (it had been laid waste by the sea), and set on the grave of Epaminondas an inscribed stone, sacrificed at Pompey's grave, and worthily restored his tomb. Germanicus sacrificed at all the tombs of the great men that he visited; an epigram of his to Hector's *manes* has survived. Pausanias mentions amongst the tombs shown to tourists in Greece, that of King Codrus on the Ilissus, of Aristomenes of Messenia, of Demosthenes

at Calauria, and others. Every city treasured the memorials of its great men: Thebes possessed the tomb of Pindar and remains of his house by Dirce. But Athens, in this respect, was the richest of all, and the most zealous, a thronged cemetery of greatness.

But the main centres of interest in Greece were the Persian battlefields and camps. On the plain of Marathon, the tombs of the fallen, of Miltiades and the marble trophy were preserved, and, at night, the neighing of the horses and trampling of the hosts might be heard. The ruins of temples burned by the Persians were still seen by Pausanias. Later epochs were also commemorated. 'We saw', Arrian writes to Hadrian, 'the Black Sea from the same spot as Xenophon did and you too'. He replaced the altars of unhewn stone with ungrammatical inscriptions by marble altars correctly inscribed.

The steps of Alexander the Great in Greece and the East were lovingly tracked out. In Plutarch's time an ancient oak on the Cephissos was shown, under which his tent had been spread at the Battle of Chaeroneia, and near it the general grave of the Macedonians. King Mithridates, on his campaign in Phrygia, stayed for the night, for good luck's sake, at the same inn as Alexander. At Tyre a spring was shown at which Alexander dreamed he captured a satyr: a dream interpreted as referring to the taking of Tyre. At Minnagara (on the Lower Indus), the Egyptian merchant in India would visit the spots consecrated by the memory of the Macedonian army, by chapels, altars and encampments and wells. The crypt at Alexandria, in which Alexander's body was preserved in a glass coffin in honey, was probably seen by all the Emperors, who visited it, though forbidden to ordinary tourists. We know of the visits to it of Caesar, Augustus and Severus, who walled it up: but Caracalla also saw it. The Mohammedans revered a so-called tomb of Alexander at Alexandria. 'Just as you', Pliny says, in describing Trajan's distant campaigns, 'are shown the sacred remains of great generals, the time will come when posterity will long to see, and will bring their children to see, the field where you sweated, the trees that afforded you rest, the rocks which protected your slumber, the houses you honoured as a guest': a prophecy fulfilled, accord-

ing to Ammianus Marcellinus, who says, speaking of Julian's march in the valley of the Euphrates, that in the town of Ozogardana the tribunal was shown whence Trajan had addressed his host.

In Italy and the West, in the almost complete absence of legend, memories of Roman history were the only features, zealously sought after. At Laurentum, the encampment of Aeneas was shown, which was called Troy ; at Liternum olive-trees, planted by the Elder Scipio, and a huge myrtle overhanging a grotto, where a snake guarded over his *manes* ; at Baiae jewelry and a little cloak given to Tiberius as a child by the sister of Sextus Pompeius ; at the bottom of the spring of Aponus near Padua dice he had thrown in ; at Capri the place whence he flung his tortured victims into the sea ; Horace's home at Tibur, and the houses where great men and emperors were born. Augustus was born on the Palatine at Capita Bubula (Oxheads), and that part of the house had been turned into a chapel : but, near Velletri, a little room like a store-cupboard on an estate was reported his birthplace, which in Suetonius' time was haunted and terrified any one who entered without reason and impure intentions. Titus was born in a dark little room at a poor house in the Septizonium, which was kept and shown in Suetonius' time. 'The fortunate home that heard Domitian's first cry, and saw his first attempts at crawling' (Martial) was converted by Domitian into a sanctuary of the Flavii, and gleamed with gold and marble. The house of Pescennius Niger on the Campus Jovis at Rome was visited in Diocletian's time, and still named after Niger. Seneca in the villa of Scipio Africanus at Liternum, comparing the changes of time, did reverence to the *manes* of the great man and his supposed coffin : he saw 'the freestone villa, the walled-in park, towers on either side to guard it, a huge cistern, and near by, outbuildings and plantations, and a small narrow old-fashioned bath-house. In this nook the Terror of Carthage washed himself after field-labour, for he cultivated the land himself. Under this mean roof he stood, on a wretched plaster-floor.'

Historians, of course, aimed at seeing the localities of their subject, and Suetonius was especially conscientious. Appian visited the scene of the murder of Cicero near Caieta,

and Plutarch the battlefield of Bedriacum and the monument of Otho.

Similarly Jews and Christians in Palestine and elsewhere visited Biblical sites. Josephus mentions the remains of Noah's Ark on a mountain in Armenia (placed by others in Adiabene), and the pillar of salt into which Lot's wife was turned (he had himself seen it); and, near Hebron, the graves of the grandsons of Abraham and a huge terebinth as old as the world. By the beginning of the fourth century, Christian pilgrimages were common, and no place famous in either Testament was left unvisited. We have as authorities the Pilgrims' Route of 333 A.D. from Bordeaux to Jerusalem, and the tale of a noble Gaulish pilgrim of her journey to the Holy places (383-5). The thornbush, whence God spake in fire to Moses, was then in a well-kept garden in front of a church with cloisters round it, and the spot where Moses stood was also shown. At Carrhae in Mesopotamia, the spring at which Rebecca tended the camels of Abraham, and the one at which Jacob gave drink to Rachel's flock were visited; and near them was the huge stone which Jacob lifted off the well. But the Gaulish lady did not see the pillar of salt, but only the place of it; she will not deceive her sisters. But it was visited by a pilgrim from Piacenza in 510 and was still upright; and he says it is not true that animals had sucked it down.

§ 2. ART AS A MOTIVE

History, in the manner described, was the main incentive for Roman tourists, as the following lines of a Roman poet under Nero on the wonders of Etna show: 'To behold beautiful temples with ancient treasures and sacred antiquities, we face the dangers of land and sea; greedily seeking the tales of old lore from folk to folk; now glad to see the Ogygian walls of Thebes, built by two brothers scarce akin: there we live the ancient times, gazing at stones which moved to song and string, and at the altar whence arose the smoke from the double offering; and we wonder at the spot where the Seven Heroes wrought and Amphiarus was swallowed up. Or the Eurotas and the City of Lycurgus and their devoted company who followed them unto death enchants

us. Or we see Athens, proud in her minstrels and her protectress Athene. Here Theseus forgot to hoist the white signal to his father on his return ; Athens, too, bears the guilt of the tragic fate of Erigone, now a famous star : thence was born Philomela, who now inhabits the vocal woods ; Procne, who nests on roofs ; Tereus the wild, who hops about on bare fields. We gaze on the ashes of Troy, and Pergamus that fell with Hector's fall, see the little mound of the great Hector, Achilles the swift, and the avenger of Hector.'

He, however, proceeds on to art as a further motive : 'Yea, Greek pictures and statues attract many : the *'Αναδυομένη* with her dripping hair, Medea the terrible, with her little ones playing at her feet, the sacrifice of Iphigenia with the father veiled, or some work of Myron. These many works of art make many cross land and sea to visit them'.

Of course, cultured Romans on their travels saw the treasures of art in Greece and Little Asia. Cicero says of Pompey, that nothing could detain him in Greece ; he would not even look at the statuary and painting of Greece, which others generally pilfered. Cicero also mentions several works of art stolen by Verres from private owners and from temples, which every visitor had been taken to see. In the chapel of Heius at Messana there was a Cupid of Praxiteles, a Hercules of Myron, two *κἀνηφόροι* of Polycletus. The house, though private, was a general tourists' resort. In Syracuse a picture of a cavalry battle of Agathocles in the temple of Minerva was a principal feature, as at Segesta the statue of Diana, which Cicero as Quaestor also saw. Propertius, in Athens, aimed at studying Plato and Demosthenes and Menander, and also the art and sculpture in bronze and ivory. Apuleius notes his seeing the portrait of Phidias on the shield of Athene on the Acropolis of Athens.

Works of art of universal fame and individually known to any cultured man, such as the larger cities of Greece still possessed even under the Empire, were always and sometimes expressly visited, though many of those mentioned by Cicero as being in Greece and Little Asia had been removed to Rome. In Cicero's time Thespiae was always visited solely for a Cupid of Praxiteles, and, according to Pliny, Cnidos for his Venus, reputed by some the masterpiece of the world. 'You travel to Olympia', says Epictetus, 'to

see the Zeus of Phidias, and deem it ill-luck to die without having viewed it'. This remark is addressed to Greeks, but may well have been applicable to Romans.

But everywhere history and not art was the object of Roman travel; art is only incidentally mentioned. Generally interest in art was superficial, stimulated only by the celebrated name or work. Once seen, and that was all; the tourist, says Tacitus, came and looked at the picture, and went away satisfied. The Roman saw in order to have seen, like modern Englishmen whose interest is mainly historical: Atticus' letter to Cicero on Athens is typical. 'Places', he says, 'containing tracks of those endeared and revered, make a certain impression on us. My darling Athens attracts me, not so much for her Greek buildings and monuments of ancient art, as for her great men, where they dwelled, sat, talked and lie buried'.

§ 3. NATURE AS AN INCENTIVE TO TRAVEL

Nature, much more than art, attracted the Roman: more recreation, says Atticus, is afforded by Nature than by art. But the feeling was very different from that of our days, not direct, but aroused by celebrity, rarity or sanctity.

Its main differentia was its religious character: the ancients attached to remarkable phenomena a divine or daemonic content, which evoked awe. This awe the Greeks personified in myths: to the Italians it remained a strange present mystery, a shapeless 'weaving and swaying of impersonal spirits' pervading all Nature. The religious sense, which felt every single instant the influence of protecting powers, was most excited by free Nature. 'Wherever some intimate place aroused pleasant recollections, or some fine view stirred the soul, some fruitful valley or fertile field provoked the sense of a divine boon, they would erect a simple altar, with a sculptured snake in gratitude to the unknowable *genius loci*.' However much the old religion might have changed in the course of the centuries, the piety of Nature remained alike to Romans and to Greeks, and its evoking causes, ever the same, never lost their hold on man's soul.

One quotation from Seneca may exemplify the many expressions of this religion of Nature to be found in Roman writers

and poets. 'You see a grove. The ancient trees are thickly clustered together; their height and their interlacing foliage shut out the sky, a huge darkness in the open fields. And a bewilderment seizes you, teaches you the presence of a god. Or some deep grotto has been hollowed out by Nature alone, and has eaten its way far into the solid rock; the soul feels a something higher: and it is meet to place altars and reverence the well-heads of great streams, the spot where a torrent bursts forth from the dark earth, where hot springs bubble up, or lakes unfathomable or mysteriously sombre.' In such solitudes, divinity seemed nearer and more present; and, more than in the turmoil of streets, was the religious sense manifested: the twilight of caves or old trees, or enclosed hills, moved the wanderer to involuntary worship. Thus places, naturally beautiful, were frequented not only for their beauty, but to worship the god of that locality.

'Living water, that came to light without man's work, a *caput aquae*, with a *perpetua causa*, as the jurists say, received worship, both in and after Pagan times.' Into these sacred wells offerings would be thrown, coins especially (they are now often found in river-beds and springs), and chapels erected. Thus there was a temple at the source of the Seine at the end of the first century; and a magnificent shrine, built in a semicircle on to the sheer cliff, overlooking 'the loveliest of views' (its ruins are still imposing), was erected over the spring in the Djebel Zaghuane, with its crystal waters: it fed the aqueducts of Roman Carthage, which were probably built by Severus and Caracalla; the Arabs included it in the Wonders of the World. Thus, too, the source of the Clitumnus in Umbria attracted visitors no less by its sanctity than its beauty. From a cypress-crowned hill it welled forth, ice-cold, of a transparent green, reflecting the ashes on either bank, expanding into a navigable stream lined with country-houses. At the sources stood an ancient temple and several chapels (one, reconsecrated for Christian use under Theodosius still exists): walls and columns were covered with inscriptions from the numerous visitors. Caligula once journeyed to Mevania to see the grove and source of the Clitumnus. There must have been many others; the Po, Pliny says, springs from a beautiful well-head.

Of the grottoes the most famous was the Corycian on

Parnassus. Pausanias calls it the greatest and most beautiful he had seen, and another of the same name near Corycos in Cilicia, a huge ravine; Pausanias describes three other great sacred caves in Little Asia. It was not strange if the wonderful stalactites and formations, the drippings of water from the roof, and the subterranean streams in these twilight or torch-light darkneses made the caves seem the dwellings of gods and nymphs, and the noises the music of daemons. The recesses of the Corycian Grotto in Cilicia, according to Pomponius Mela, awed off any one from penetrating them. All the larger caves had their deities and images of them.

Equally natural was the veneration of giant trees. 'Once', says Pliny, 'trees were the temples of the gods, and to this day the simple dedicate a tall tree to a god, and we revere images gleaming with ivory and jewels no more than the awing silence of groves'. In the depths of forests the mysterious fear, which to the ancients signified the approach of godhead, was felt most deeply. Pausanias gives a list of prehistoric trees in Greece, the willow at Samos, the oak at Dodona, the olive on the Athenian acropolis. The palm of Apollo at Delos which Odysseus had revered was said to be standing in Pliny's time; a natural impossibility for the date-palm. The oldest trees in Rome, according to Pliny, were a lotus-tree on the Vulcanal, said to be older than the city, a cypress of the same age, which fell in Nero's latter years, a lotus-tree in the courtyard of the Temple of Lucina (which was 450 years old), itself said to be older, and a few others, besides huge trunks in which several men could stand. Such trees were evidently much visited; amongst them were the pine on Mount Ida (220 feet in height) on which Attalos I of Pergamus had written, and several huge planes. 'What were more to be desired in the barren mazes of rocks in the South, and more to be worshipped and admired, than the tree with full bright foliage on a green-grey trunk, with murmuring brooks at its feet, refreshing the succeeding generations of men?' Pausanias gives prominence to the plane at Caphyae in Arcadia, planted either by Menelaos or Agamemnon. 'Greece derived trees and joy in them from Asia, where the plane and cypress had long been revered by the Iranians and the tribes West of them.' In Aulo-crène in Phrygia in Pliny's time, the plane was shown which

Apollo had selected for its height to be a gallows for Marsyas. One of the largest planes was in Lycia by a spring, no doubt also having its myth; its hollow trunk was eighty-one feet round, and its foliage at the top still spread a broad circle of shade: Licinius Mucianus the consul 'dined inside it with eighteen guests, and rested after the banquet, and acknowledged the view finer than from the gaudy marble halls of Rome'. At Gortyn in Crete was the ever-green plane, under which Zeus had embraced Europa, and celebrated in poems, Greek and Latin, which were perhaps nailed on to it.

Literary fame was a second great advertisement for tours to particular places, just as Jean Paul's Titan popularized the Borromean Isles and Ischia, at any rate up to the forties, and Scott his own highlands. A much-described district would be largely visited: most of the places already mentioned were thus celebrated. Pomponius Mela's account of the Corycian Grotto in Cilicia has a poetical ring, like Pliny's of Tempe, 'on both sides soft inclines rise till lost to view: the Peneus flows through with grassy-green banks, between avenues, with birds singing from the tree-tops'. Tempe was one of the places, imitations of which decorated Hadrian's house at Tibur. Seneca inquired of his friend Lucilius, who had toured through all Sicily, only after the real nature of the whirlpool of Charybdis: he already knew that Scylla was a harmless rock. St. Jerome, in a brief account of his journey from Italy to the East, says he had all the old legends of Scylla told him at Rhegium, of Ulysses' danger-ridden course, the songs of the Sirens and the insatiable maw of Charybdis. 'Travelling', says Seneca in one of his letters, 'will do you good by giving you knowledge of peoples, shapes of mountains, plains extending to unknown lengths, valleys with eternal waters trickling through, or some unusual river, such as the Nile with its summer floods, or the Tigris which vanishes from sight, and re-emerges as broad as ever, or the Maeander, the common-place of poets, with its contortion in and round about itself, but you will not become better or more sensible'. These rivers attract people, not for their beauty, but their greatness, fame or strange qualities. Apollinaris Sidonius, in a letter to a friend, describes his journey to Rome, and tells what famous cities, battlefields, sacred mountains, or poets' streams he has seen. 'As we are born

to lofty things', says the author of the *De Sublimitate*, 'we admire not little streams, however clear and useful, but the Nile, the Danube and the Rhine, and the Ocean'. The disappearance of the Tigris 'into a yawning cleft' and its 'underground flow', real or fabulous courses of other streams, exercised many poets. These quotations are from verses of Nero: Lucan and Dionysius (under Hadrian), the writer of a geography in verse, also deal with the same topics.

Thus we come to the third great attraction, abnormal phenomena. The floating islands in Lake Vadimonis near Ameria, Pliny the Younger says, are passed by, as being in Italy: similar, not more remarkable sights are sought abroad. Romans and Greeks in the West travelled to Gades or the West coast of Gaul to see the tides of the Atlantic, as did Lucian's friend Sabinus in Gaul. Philostratus had also seen these tides, and makes his Apollonius go to Gades for the purpose: he tells the superstition believed to this day on certain coasts, that the soul cannot depart the body except at ebb-tide. Strabo, Apuleius, Galen and Cassius Dio describe a ravine near Hierapolis in Phrygia, out of which carbonic acid came forth, and killed men and animals (except, as they said, eunuchs): they experimented with birds and other animals. This place was much frequented, a building was put up affording a more convenient view: Dio calls it a theatre, and Strabo does not mention it; in the time of Ammianus Marcellinus, the sight had been forgotten. Naturally, all spots, whence deadly fumes arose, believed to be descents into the Nether world (Averni, *Χαρόνεια*) were similarly frequented: such was the lake near Cumae still called Lago d'Averno, with its solfatara, and made world-famous by Virgil. To count up only the celebrated real or imaginary freaks of Nature, all more or less fabulous, would be impossible: and sufficient have already been instanced.

Next, an immediate interest in Nature is proved by the well-known Roman love of country life. It may have been occasioned by the insanitary condition of Rome in the summer: but it was also the desire to escape the bustle and dirt of the city, and enjoy the quiet and solitude of the country, to have, as a Greek writer says, 'the refreshing sight of mother earth'; and often enough, man's work seemed mean in comparison with the sempiternal splendour of Nature.

Hellenistic poetry evoked many echoes of this sentiment, and amongst the commonplaces of rhetoric was the contrast of town and country, art and nature, supercivilization and the life of nature. But a true feeling for nature is to be met with in many prominent Roman authors. The country, said Varro, was given by God, and the town was made by man; he preferred the fruit-stores at Scrofa's villa to the picture-galleries of Lucullus. Lucretius, too, was content to lie by the brook on the grass under a lofty tree in smiling weather on the flower-clad lawns, and to leave to others the golden halls of luxuries and lamplight and banquets and lyres. Atticus says in Cicero he could not sate his eye with the view of the islands in the Fibrenus, and despised gorgeous villas with their marble floors and rich panelling: their garden-canals were nothing beside his stream. So Seneca the Elder: 'I can scarcely believe that those who copy in their houses woods and seas and rivers have ever gazed on broad green stretches with a torrential or quiet river; have seen the sea from a height in summer calm or winter storm. Who, after viewing these mighty things, were content with the petty?'

Virgil's description of the happiness of the rustics is well known, 'were they but conscious of it'; as also his longing for the calm, pure, peaceful life of the country, his joy in valleys, refreshed by cool streams, in woods and fields and grottoes and lakes, in the lowing of oxen, and sleeping under the trees; his yearning after the dales of the Spercheus, the theme of Greek verse, and the umbrageous combes of Taygetos and Haemos. And Horace was the most eloquent on this contrast. In the country the winter was mild and the summer cool; and sleep sound; the fragrant grass brighter than bright stones, the natural spring cleaner than the fountain with its leaden pipes. So, too, Propertius praises the splendour of autonomous nature over against trim gardens; the glories of the meadow-flowers, and the clinging strength of the ivy, and the trees in the lonely ravine, the brook in its own path and the pebbly shore. Martial, too, a lover of country-life, is sympathetic towards real ruralities untainted with town. Juvenal deplors the decoration of the grotto of Egeria, and says her godhead was nearer in a clothing of grass than in a mantel of marble. Not only poets, prose-

R.L.M.

C C

writers as well celebrate the superiority of Nature to human makings, and dwell on the refreshing glimpses of the silent green, the murmuring river, or the distant view, the songs of the birds and the fresh breeze, where in solitude time may be dreamed away: and, to the Romans, Nature was the true place of birth of poetry and thought.

This love of Nature was evidenced in the plans of the city homes of the rich, in which gardens and views were deemed essential. According to Pliny, Epicurus was the first architect of gardens in town. At any rate, the custom came in at the time of the *Διδόχοι*, and the feeling for Nature was more or less similar to our own. In laying out houses, this epoch took account of this passion and invented the *Cyzicene* rooms. 'These lay North, had in the middle a door, and on both sides Venetian windows, and from the two *trichinia* in them there was a view into the open. They were evidently designed for the enjoyment of Nature in the summer. Vitruvius mentions them as a part of a Greek house, occasionally, in his time, used in Italy. *Cyzicene* rooms spread in Italy with Hellenistic influence. Pliny the Younger in two gardens had them.' By Sulla's time Roman city houses had gardens and parks. The six lotus-trees in Crassus' garden on the Palatine were in 22 B.C. valued as high as the palace itself, at 3,000,000 sesterces. Cicero's friend Atticus had his house on the Quirinal; it formerly belonged to one Pamphilus; he inherited from his maternal uncle: its main feature was the park. Sallust's exaggerated phrase of palaces built like cities, points to the frequency of large gardens in Rome. Horace, too, makes repeated allusions to little woods and groves between the gaily statued peristyles: a house with a wide view on fields was highly recommended. The tendency was always to assimilate the city house to the country villa. Martial describes the *Petilian* palace, which was on the highest part of Rome: it was a *rus in urbe*; its vintages better than those from a *Falernian* vineyard; carriage-drives might be had inside the grounds, and sleep was immune from the noise of the streets and the glare of day. In Philostratus, the owner of a large house in Rhodes, which cost twenty-four talents (£5,700) to build, remarks that he need not go out much, as there were walks and groves in it. Even bath-rooms might have distant

views. Seneca observes that the luxurious rich deemed bath-rooms without large windows looking out on fields and seas only fit for moths. Nero's Golden Palace, the type of pomp, was not noticeable for gold and silver, 'a usual luxury', but for its lawns and ponds, and mock-forests and views. A jurist of the second century, writing of charges on estates, says that they consist not in doing something, but in allowing or not doing something, as e.g. that a man need not decorate his house with paintings, or lay out a garden, or arrange a beautiful view.

If this was so inside towns, in the country villas would always be on eminences. Martial praises the villa of his friend Julius Martialis on the Janiculum for its view. All Rome and the Campagna up to the Albanian mountains could be discerned, and all the little towns, the busy main roads, the Tiber up to Ponte Molle with its burden of boats. The position of the Younger Pliny's Tuscan villa can be instanced as the Roman ideal. A broad plain could be seen framed in, like an amphitheatre, by the Apennines: from the loftier peaks old forests clad the slopes, with intervals of corn-fields, vineyards, green flowering meadows, and in the valley the Tiber and many streamlets. This lofty view was a great pleasure; it was more like a picture; and the eye was charmed with variety.

Hardly ever in ancient literature, as we may expect in the South, is a waterless country praised. It was not only the pleasant gaze on the limitless blue of the sea, on the reflections in the lakes, the silvery brooks and streams, and foaming waterfalls that attracted men, but also the cooler atmosphere. Further, in the South, in the absence of water everything is grey and dry; only on the banks is the green fresh, the vegetation luxuriant, the trees shady. 'What is fairer than water?' asks Petronius. The shores of inland lakes, narrow dales with trickling rills and ravines, broad river valleys attracted the lovers of Nature.

The Vale of Tempe, ideal scenery to the ancients, 'unites the charm of the river valley with the wild grandeur of a rocky ravine'. The river Peneios here enters a ravine some four miles long, between steep offshoots from Ossa and Olympus descending sheer down, covered with foliage. Olympus presents but sheer rock, but on the right bank there is a narrow belt of fertile land, sometimes widening

into little plains, containing springs, and covered with grass, laurels, planes and oaks. The river flows through peacefully, here and there forming an islet, varying in breadth to a narrow rock channel, canopied with plane-trees, impenetrable to the sun.

Thus in all descriptions of Nature vegetation and running water are the first constituents. Horace's shady valley in the Sabine Mountains had its main charm in the spring Bandusia with its babbling waters and ancient oak, clearer than crystal and cool even in the dog-days. Catullus loved above all things, 'beyond other isles and peninsulas guarded by Neptune in lakes and waves', Sirmio on Lake Garda: no doubt it was then laid out garden-fashion: there are Roman ruins on it, perhaps of *thermae* of the date of Constantine. Far and wide, says Seneca, there is no lake whereon the villas of the Roman rich do not project, and no river. Pliny exalts Trajan for not copying his predecessors and expropriating other owners, welding all these ponds, lakes and woods into one man's sole domain. On Lake Bracciano there are the ruins of a *Sans-souci* (Παυσίλυπον) of Tiberius' time, belonging to Metia Hedonium. Pliny the Younger shows that Lake Como was lined round with villas, as it was in Cassiodorus' time, whose ranting betrays an intense love of Nature. He calls the site of the city of Comum so beautiful, as to have been built for pleasure. The sea is shell-shaped, its borders marked by the white foam, and cased in by high mountains: the shores, decorated *praetorium luminibus*, with the splendours of its palaces, are belted round with olive-woods. Vineyards hang down from the hills, their ridges crowned with wreaths of chestnuts. Snowy waterfalls percolate into the lake. A Carolingian poet celebrates the beauty of Como, its green grass ever spring-like, the olives on all sides, and laurels and myrtles, granates, damsons and lemon-trees. Less famous scenery, however, had its water-mirrors. Apollinaris Sidonius, in a modern-sounding passage, describes the rivers of Lombardy: 'the Lambro with its bulrushes, the green Adda, the torrential Etsch, the tardy Mincio'; and the oak woods on its shore, with the many singing-birds, and the thickets of reeds, in which the birds nested.

The course of the Anio, 'the most delightful of rivers', was

beshaded with woods, and lined in for all its length with villas, the most famous being Nero's at Subiaco. Tibur with its resounding grotto of Albunea, the fall of the Anio and the grove of Tiburnus owed its celebrity to the waterfall. On the estate of Manilius Vopiscus, described by Statius, were two palaces on either bank, on a calm spot intermediate between two waterfalls. A thick lofty forest came to the verge of the water, which reflected the leaves. It was cool there even in the dog-days, and the July sun could not parch the inner rooms. According to the Elder Pliny the shores of the Tiber were more lined with villas than any other river. Herodes Atticus owned a villa at Cephisia, which is still, through its cool situation, its many wells, gardens, olives, cypresses, planes and silver poplars, an 'oasis in the Attic desert'. There, according to Gellius, there was the shadow of immense groves in the greatest heat, and the melody of streams and birds ever to be heard.

In the manner of the feeling of nature of his time, and, like the Greek sophists, Josephus paints the region of Lake Gennesaret as a 'country of marvellous beauty', extraordinarily fertile, thanks to the well of Capharnaum. So, too, a notable Gaulish pilgrim of the fourth century says she had never seen a lovelier land than Yessen (Goshen), a country of vineyards, balsam, orchards and cultivated fields. Procopius and Luxorius depict the pleasure-gardens Rome erected near Carthage (in which the Vandals debauched at ease), and Luxorius extols the groves full of song-birds, the clear brooks and their mossy banks, the fragrant flowers, and the pavilions and watchtowers rising from the meadows.

But, of all regions, the ancients most loved the seashore: seashores and beautiful scenery were almost synonymous. Ancient poetry and legend is full of eloquent appreciations of the beauty of the seacoast. One passage of Catullus may be reproduced:

Hic qualis flatu placidum mare matutino
 Horrificans Zephyrus procliuas incitat undas,
 Aurora exoriente uagi sub limina solis,
 Quae tarde primum clementi flamine pulsae
 Procedunt (leni resonant plangore cachinni),
 Post uento crescente magis magis increbrescunt
 Purpureaque procul nantes a luce refulgent. (lxiv. 269. . .)

Ancient art, too, derived much inspiration from this theme, the sea, which to Romans and Greeks was the noblest and fairest sight. 'How mighty', Cicero exclaims, describing the wonders of creation, 'is the beauty of the sea, the view of its hugeness, the manifold isles, and delightful coasts'. It was an inexhaustible and perennial pleasure. Marcus Marius, the friend of Cicero, had a passage broken through on his estate at Stabiae (Castellamare) to gain a free view from his villa on to the gulf in the morning shimmer. Cicero writes to Atticus from Puteoli: 'Do I enjoy the view from the heights more, or the sea close at hand? I do not know. I cannot discriminate'. The letters of Cicero and Pliny the Younger are full of such expressions. Plutarch brings forward as a common saw, that a sail along the coast and a walk on the shore is the supreme pleasure. Libanius, in his panegyric on Antioch, tries to compensate the absence of a sea view by the absence of the seamy side of a sea-resort. The most characteristic proof, however, is Justinian's decision that no one in Constantinople might obstruct the view of the sea, a *πράγμα χαριέστατον*, by buildings less than 100 feet away. Procopius, too, exalting the beauty of the situation on the Hellespont, describes the Emperor's dwellings close on the shore, and the effect of architecture and the mirroring sea.

But the sites of Roman villas testify to this love of the sea, much more than does their literature. The villas lined the whole coast from the Gulf of Spezzia to the Gulf of Salerno and further still. How intensely Romans aimed at enjoying the sea in every fashion, and, the richer at least, built out into the sea; how they multiplied and variegated the views of it is shown by the facts already brought forward, and Pliny the Younger's special account of his villa at Laurentum. There was a dining-room built out on the coast so far, as to be sprayed if the wind were in the South-West. Through the folding doors and the windows (which went to the floor) the sea was seen from three sides. One window of a large room afforded a view of the broad calm sea. The warm sea-water swimming bath also afforded a view, and an upper window looked out on the sea and the coast. From the three windows of an alcove views of sea, villas and coast could be seen together or apart and so on. The villa of

Pollus Felix on the heights of Surrentum gave a view from every window on to Ischia, Capri and Procida, and, above all, on the sea ; at sunset 'the shadow of the wooded hills fell on the water and the palaces seemed to swim in the crystal surface'. Of the pleasure resorts on the West coast of Italy, and the North coast of Egypt we have already spoken. Near Old Canobus the foundations of a building might recently be seen, like the Roman villas, built into the sea. Fragments of statues lay about on all sides. In Greece ruins of Roman villas are met with on the coasts.

Such was the nature loved by antiquity and celebrated in literature. But any wild or savage scenery, any majesty, or terrible or sombre monotony they did not admire : valleys and hills and the coastlands were all they liked. Mountains were beautiful, as a graceful definition of the horizon, or framing of the landscape : but there was no charm for them in the hills or the mountains as such, or in the melancholy splendour of a desert ; in the enchantment to us of the modern Campagna. Catullus, who was delighted with the peninsula Sirmio on the level shore of Desenzano, would have had not a single word of praise for the Riva and its bare cliffs.

Ancient love of Nature was as intense, but narrower than that of modernity. It is typical of it that *amoenus*, charming, was the most frequent expression of admiration. Quintilian says that *species* or beauty is attributable to the 'level, charming and marine regions'. To these three categories may be added the countries mentioned as the most desirable in Lucian's *Ship*, in which all the pleasures purchasable by a Fortunatus are dealt with, viz. the environs of Athens, the Eleusinian territory by the sea, the land of Sicyon, and 'any shaded, well-watered and fertile part of Greece'. Hermogenes the *rhetor* mentions as examples of things pleasant in description and in actuality 'the beauty of a region, various plantations and kinds of running water', and similar features, recalling somehow the plane by the brook in the Phaedrus. Libanius praises Julian the Apostate for selecting Athens and not Ionia as his residence as Prince, because of the gardens and fields on the shore.

But express disclaimers of the beauty of mountains can be found. Cicero says, as an instance of the power of habit, that we can come to like any region we have long dwelt

in, 'even mountainous and hilly parts'. He makes Atticus, astounded at the beauty of the Isle of Fibrenus, say he had near Arpinum seen only rocks and hills, and wondered how his friend could like it. A further proof of this distaste for the heroic in nature is afforded by the fact that Cicero never mentions the two falls of some twenty-five metres of the arms of the Liris, enclosing the Isola, one being perpendicular, and the other a sharp incline; nor does any one after him. Virgil's admiration for 'Father Apennine', with his swaying rustling oaks and snowy head and confident gaze heavenwards, is derived from a distant view. In his enthusiastic laudation of Italy's beauty, Virgil praises her fertility in corn, oil, wine, herds, her climate, cities, peoples, lakes and seas and mines; of her mountains no single word. Seneca's impugning of Corsica as a horrible rock may be coloured by his dislike of his enforced residence and his habitual exaggeration; but it also shows that that age had no eye for the rich colouration of that island. The suburb of Antioch at the foot of Mount Casius is celebrated by Libanius, because the mountain did not terrify the inhabitants, but lavished all that joy can demand; wells and trees and gardens and blossoms, and song-birds, and a very early springtime.

To the beauty of the Alps the educated world was blind: Livy characterizes the feeling in speaking of the *foeditas* of them. Modern travellers to the desolations of ice near the North Pole have been equally impervious to the majestic terror of the scenery. At a time when every year hundreds and thousands of Romans crossed the numerous Alpine roads, and Switzerland was a Roman land, travellers had no eye save for the difficulties of the narrow mule-paths, the wilderness of ice and snow, and the horror of the avalanches. This lack of sympathy with the enchantment of the terrific in Nature is why 'of the eternal snow in the Alps, ruddy at sunset or sunrise, of the marvellous blue of the glaciers, of the magnificence of the Swiss landscape, no ancient said one word: it is why Silius Italicus describes the Alps as a horrifying barren desert, whilst lovingly dwelling on Italy's ravines and wooded shores'.

Mountain-climblings are very seldom mentioned in antiquity, and their infrequency and failure augmented their severity. They were regarded as ordeals, as Pliny's praise of the elder

naturalists shows, who indefatigably sought for herbs 'even in pathless mountains and remote deserts': and none of the ancients knew of the Alpine plants. Polybius says, in a comparison of the Greek mountains with the Alps, that the former, such as Taygetus, Parnassus, Olympus, Pelion, Ossa, Haemus and Rhodope, required only a day's ascent; the latter required five days. If, therefore, the Greek mountains were often climbed, it may have been for the view. It is possible that the Greeks, after Alexander the Great, took over with the 'inheritance of the Persians', the Persian love of panoramas. Strabo mentions a marble *belvedere* erected by them on Mount Tmolus near Sardes, affording a view of the whole valley of the Cayster. A rather scanty description of the view from Olympus in Apollonius Rhodius may be based on personal experience: 'beneath the nourishing earth was seen and the cities of men and the Holy streams, and on high peaks, and, all round, the sea'. A measurement of the height of Olympus by the plumb-line and instruments by one Xenagoras worked out at 4,814·3 feet. King Philip of Macedon in 183 B.C. undertook the ascent of Haemus, not for the sake of the view, but in the belief that the Adriatic could thence be seen, and the directest road made out. The danger of the expedition made him leave his son Demetrius behind. The summit was reached after great efforts on the third day, and altars were erected to Jupiter and the Sungod. The belief that the Adriatic and the Black Sea could be seen thence was perpetuated. Strabo contradicts Polybius in the matter, but Pomponius Mela re-affirms it. Pliny makes the height of Haemus out at six miles (1·198 geographical miles). 'Those who have ascended to the eternal snow of the summit of Argaeus near Mazaca in Cappadocia, report, says Strabo, 'that two seas can thence be seen, the Issic and the Pontic: but such people are few'. 'Hence', says Solinus, 'it is believed to be inhabited by a god'. But Mount Neptune at the North end of Sicily may often have been climbed, and the view was said to extend over the Tuscan and Adriatic Seas.

The only mountain, unquestionably often ascended, was Etna. Strabo says the station for the ascent was the little town of the same name at its foot. Shortly before his writing, a small company had climbed up, and he gives their account

of the principal crater. But, as Vesuvius was then quiescent, these ascents will have been actuated rather by science than an interest in Titanic Nature. Seneca begs his friend Lucilius, imperial *procurator* in Sicily, to ascend in his honour—he would gladly have done it himself—and inform him how far the eternal snow is from the showers of fire. The poem on Etna, probably by Lucilius, is purely scientific, and says absolutely nothing on the view to be obtained; whilst, nowadays, even in scientific reports of ascents, the view is always described. Hadrian ascended Etna to see the rare sight of the sun emerging from the sea, which from the summit has the appearance of a long crooked streak. The so-called Tower of the Philosopher on Etna, once a large building with several rooms, was found by Fazello in 1541 still to consist in a well-preserved brick edifice; it was certainly of Roman origin, and, according to Gemellaro's theory, built as a night-shelter for Hadrian on his ascent. Mount Casius was climbed by Hadrian and by Julian, as the sun could thence be seen at second cockcrow. From the top of Mount Ida it could be seen before daybreak.

For all these reasons even the later Empire must be denied the sense of the beauty of mountain scenery. If individuals possessed it, there is no evidence of it. Seneca's remark that those weary of the Campanian paradise, seek the wildernesses of Lucania and Bruttii, only confirms the position; for the strength of the desire for change is shown, according to Seneca, in the longing for an absolute contrast. Cicero, in speaking of the magnificence of creation, cites, besides the endless variety of vegetation fed by cool inexhaustible wells, clear streams, and green banks, lofty vaulted grottoes, sharp crags, jutting mountains and limitless plains: but this observation of the beauty of Nature refers to her wonders of size, variety and strangeness; for he goes on to add 'the hidden veins of gold and silver and the boundless masses of marble'. Thus the Roman feeling regarded mountains and rocks as parts and backgrounds of beautiful scenery, and was insensible to the rough, sombre or desolate, the grotesque and savage, as well as the majestic in Nature.

VIII. THE DEVELOPMENT OF THE MODERN FEELING FOR THE ROMANTIC IN NATURE

§ 1

The love of mountainous scenery and the romantic in Nature is to-day so universal and so primary that it has been ascribed to antiquity without or in despite of evidence. It is alleged 'that the epithets wild, savage, horrible might long be used before thought becomes aware what high feelings such scenes arouse; that words and feeling often go apart'. Such a contradiction may exist awhile, but demands strong proof and inexorable reasons.

In general, however, our thesis is undisputed, and accepted as a characteristic of antiquity. To Greeks and Romans, says Humboldt, only the homely was pleasant in a landscape, and not what we call wild or romantic. Yet the love of the romantic was foreign to the Middle Ages, and a long period after the Renaissance, or, at least, found but doubtful and isolated expression until about 1750: its universality is hardly one hundred years old.

In German medieval poetry, Nature is an infrequent theme. In Court heroic poems and lyrics conventional decorative epithets occur, such as the gentle May, the song of the birds, or scenery supplied a foreground. 'From the *Minne-dichter* no one could surmise that the noble poets inhabited and visited thousands of lofty castles in many lands. In the Latin poems of the clerics there is none of the glimpse afar, nothing of real scenery.' 'Knight and poet were blind to Nature's greatneses, or charms, or colours, to the evening glow in the sky, the finely wrought lines, steep rocks, snow-capped mountains, glaciers, rushing streams, waterfalls.'

Old English poetry contains unambiguous expressions of distaste for the mountains. An ideal scenery depicted by Cynewulf in the eighth century tells of green, flowering fragrant fields, blossoming trees, cold clear brooks and wells: but nothing of 'mountains, hollows, ravines or hills, nothing wild or irregular'. Thus too in *Sir Orfeo*, an epic of the thirteenth or fourteenth century, a beautiful district is brilliant like the midday sun, level, green; no valleys and no hills. Chaucer speaks of sheer cliffs, as horrid chaos,

not the work of an all-wise God ; he is thinking mainly of the danger to mariners : but the phrase, referring to a beautiful garden rich in green and flowers, and the work of man, clearly indicates his preference. In Shakespeare there is no sign of the impression produced by mountain scenery, nor in *Cymbeline* of its influence on character. Shakespeare seems ' caught by the spell of Nature and her nearest view, as though some Avon thicket with flowers and shadows possessed him. But for the distant he has no single word to say ' (Jacob Burckhardt, 1889).

Dante has the same preference for the broad fruitful plain, and found rocky districts ugly. The monotonous Lombard plain he calls *lo dolce piano*, from Vercelli down to Marzabo ; and, as examples of sheer savagery, he speaks of the road between Tra Leric¹ and Turbia. But Petrarch had a quicker intelligence for those incomparable shores, despite their steep rocks. He delights in the range by the *riviera di Levante* as charming in its sharp declivities and vegetation, and in the meandering coast of the Gulf of Genoa with its splendid outlines and shifting views. But this larger appreciation is unique even in Petrarch. In 1350, contemplating Lake Garda with its sea-like waves (a reminiscence of Virgil), his eye gazed long on the broad fertile plain to the left. In his description of the Roman Campagna he emphasizes the richness of the hills in flocks wild and tame, the many springs, the tilled fields, the bounty of Bacchus and Ceres, the beauty of the near lakes, rivers and the sea : his admiration of the Vale of Vacluse recalls Virgil or Horace. He is always exulting in his hermitage amid the lowing herds, the bird-songs and the rustling water, the abundant olives and vines and crops. Enea Silvio Piccolomini (Pope Pius II), in his inspired description of Italian scenery, says nothing that Pliny the Younger might not have written.

But if medieval literature shows not a sign of a sense for the Romantic in Nature, some few may have had the appreciation of educated Europe, North and Central. 'How far paintings of scenery, which developed fully by the end of the thirteenth century, can be regarded as an index of the feeling for Nature, is a question incapable of a simple reply. The lay and the expert in art do not hold the same

¹ Tra Leric e Turbia la più disorta, La più romita via. . . . (P. III. 49).

views, as modern landscapes show. The masses of to-day idolize mountain scenery, but art by predilection paints what common opinion deems ugly. The public appreciates such pictures, because the artist reproduces latent beauty to the less sensitive eye of his gazer. The same may have been the case for the older school of landscape painting, and, all the more so, the more we go back in the history of art.'

For this reason alone W. H. Riehl's very instructive monograph *On the Eye for Scenery* must be wrong, in concluding from the practice of German fifteenth and sixteenth century artists of introducing craggy backgrounds, that bare mountainous scenery was esteemed the ideal: not to speak of the rule not being as universal as Riehl thinks. Pure mountainous scenery is only introduced when in character; on pictures of hermits, of the Night at Gethsemane, the Road to Calvary, etc. And the backgrounds are never wide views or agricultural. The artist rather intends a combination of various imaginary sceneries, including rocks. A frequent composition of this sort consists in the rockwork framing in the foreground, and jutting into the horizon behind a designedly level centre-piece. This conventionalism is instanced, by a view of Cologne with sharp crags all round. In these cases the brokenness of the cliffs becomes, partially at least, a mere matter of style. The late Gothic period delighted in sharp, broken, dented lines, both in the arbitrary architecture and the crafts, and the copying of bodies and costume. The same style was thrust upon inanimate Nature. For it is observable that this seeming predilection for mountainous landscapes is far commoner in woodcuts and etchings, and is comparable to the fondness for leafless and contorted trees.

Italian landscape is quite different. Its tone is that of the gay idyll, even in representations of history and the Crucifixion. Leonardo da Vinci is an exception, and is in advance of his time in this, as in much else. He loves mountains, not only his own Apennines with their delicate contours and calm surfaces, but the Alps, which he visited as a man. He puts an Alpine background into the portrait of his fellow-Florentine, Monna Lisa. He may be said to be the first man in the world to sympathize warmly with the wild majesty of the high hills. This comprehension of mountains is something quite different from the interest in their detail in Dürer's

notebook in the Tyrol, or the arbitrary combinations of an Altdorffer, Patinier, or Bles. A few of his pupils tried, to imitate him ; but this was all the influence he had on the public or on artists.

Italian landscape developed to an equal weight with the figure, and, at last, to independence in the Venetian school, especially in the masters, born on the *terra firma*, Giorgione di Castelfranco, Palma di Bergamo, and Titian. Titian was born in the Alps, and draws mountain-landscapes, though they never dominate, as much as in Leonardo da Vinci's Monna Lisa, Maria e Anna (at Paris), Risurrezzione (at Berlin). He affects a hilly foreground inhabited, with leafy trees, and the mountains afar. Leonardo loves the phantastic or terrifying, but Titian pours into his mighty scenery a feeling of majestic peace and jocund solemnity. His is the harmony taken up by Carracci, Poussin and Claude ; he created the classic landscape.

However few or many the lay who realized these first interpreters of landscape, it is certain that in the fifteenth and sixteenth centuries North and South differed much in their feeling: the one is classical, and the other Romantic. Probably, Northern art, if freely developed, would have created a public with the same tendencies. But the Renaissance spirit conquered the North in aesthetics and in the aesthetics of Nature ; Italian art and its pupil French art overcame Germany. The reaction of the German genius in the seventeenth century in the Dutch School, scarcely affected ordinary taste. Even in Holland the realists who had no lack of the romantic spirit did not gain the approval of the majority of the educated ; these rather sided with the Italian style. The eighteenth century paid absolute homage to decadent classicism.¹

Travellers were few who visited the mountains before the eighteenth century for scenery's sake ; in the diaries of those who were forced to cross them, there are few expressions of admiration. Magister Thietmar in 1217, on a pilgrimage to the Holy Land, found Mount Carmel beautiful (*visu delectabilis*), 'because it abounded in dales, and was good grazing-ground'. The same qualities awarded a certificate

¹ G. Dehio.

of 'pleasant' to Mount Lebanon from four men who travelled to Jerusalem in 1556; the same view was expressed by Leonhard Rauhwolf (1573-1576), a physician and botanist of Augsburg. Enea Silvio visited Scotland, and speaks of the customs, saying nothing of the scenery. But Leonardo Bruni of Arezzo describes his impression of the Alps on his way through the Tyrol and Arlberg (Mons Aquilae) to the Council of Constance. 'So huge are the mountains and rocks, so manifold and broad the ridges, so awing the peaks and numberless ascents, that one fitly wonders what the mother and shaper of the world, Nature, was thinking of. At the sight of these eternal and unbroken masses, a shuddering and awe (*horror quidam . . . religio*) seized me, which the memory of them still recalls.' Trent he calls an agreeable town 'considering the surrounding country', for above and below, is the plain, and it is well situated on the river. Tramin is a beautiful and rich spot, but *terribiliter* overshadowed by frowning rocks. The Lake of Constance he liked exceedingly.

German pilgrims to the Holy Land generally passed through the Tyrol, especially after the construction about 1480 by Duke Sigismund of Austria of a good road on the traces of the old dangerous one, between Brixen and Bozen, the Kuntersweg (named after a citizen of Bozen, who built it in the fourteenth century). Felix Fabri, a preacher-monk, of Ulm, crossed by the Kuntersweg on both of his pilgrimages to the Holy Land in 1480 and 1483 both ways: before and after reconstruction. He says: 'The mountains are very horrible, and one is either in the glare of the sun or the chill of the ice; they stretch up beyond the clouds; but the valleys are very pleasant (*amoenae*), very fertile, and produce all the delicacies (*deliciae*) of the world, a real paradise. They are densely inhabited, and there are also many mines, especially silver-mines'.

In the travels of the sixteenth and seventeenth centuries, horror seems to have been the only or the main feeling produced by the majesty of the mountains. Georg Sabinus (the son-in-law of Melanchthon and first Rector of the University of Königsberg, 1544) speaks in his journey to Trent only of the difficulties and horrors of the Alps, the yawning abysses, huge piles of snow, the cold, the avalanches, the

storms and torrents, which rolled obstructions down. Sebastian Münster shuddered on the Gemmi Pass, and describes the Swiss valleys as pretty, and the mountains and rocks and the Vale of the Rhine as cruel and frightful. So also Samuel Kiechel of Ulm, in his long tours from 1585-1589 aiming at the Holy Land, visited Prussia, Sweden and Poland, but not Switzerland, and returned by Venice and the Tyrol. The mountains impressed him, too, as merely unpassable, and uninviting in contrast with the 'beautiful country'. He was most at home in the garden-like plains, near the Hague, Delft, and Verona to Mantua, all 'beautiful, level or fertile or pleasant'. The Lombardy flats were his ideal. Kiechel speaks of the banks of the Nile and the 'pleasant air, the which, if but Christians dwelt therein, were as pleasant a passage as from Padua to Luza or Fusina to Venice'. Heinrich Schickhart the architect in 1599 accompanied Duke Frederick of Würtemberg to Italy, and 'is glad' on his way back near Nesselwang (between Füssen and Kempten), to leave 'the horrible wearisome mountains, which took ten days to cross'. J. Furttenbach, in his *Novum Itinerarium Italiae* of 1627, characterizes the Splügen, as a 'savage disgusting wilderness'. Opitz travelled far, had been in Transylvania; but in his bucolic poem *Zlatna* never mentions the charm of any scenery. Paul Fleming's poems do not contain one word of nature-impressions in his journey to Persia. Landgrave Ernst von Hessen Rheinfels, in his *Travels* (from 1636-1642), passes over the sea and the Alps and Italy without expressing admiration, but celebrates Lombardy 'as a goodly land, wherein one fareth as in a garden, and seeth nought but fair corn-land and rows of trees'.

The dwellers in the plains were cowed at the first sight of the terror of the mountains, and the danger of them rendered habituation all the harder: but the hillmen could fully appreciate their own country. For whilst in 1481 the Swiss Abbot Albert von Bonstetten of Zürich describes the Gotthard, as Silius Italicus might have done, in the sixteenth century, Konrad Gesner (1516-1565), the Linnaeus of his time, a physician, naturalist and litterateur, speaks as enthusiastically of the mountains as any modern might. 'As long as I may live', he writes to a friend at Glarus in a letter 'On the admiration of mountains', 'I have resolved to climb at least one mountain

every year, partly to examine the flora, partly for health of mind and body. What a pleasure it is to behold the huge mountains and to stand above the clouds! It awes the soul to be surrounded with the snow cathedral built by the World-architect in a single day! How empty and lowly their life, who crawl about on the level to earn and live for the day; who know not the earthly paradise'. Mount Pilatus or the Brocken (Fracmont, *mons fractus*) attracted him more than the Rigi, as it did others of his contemporaries. The ascent of Pilatus had been forbidden because of the evil spirit of the mountain; up to 1769, it was allowed only conditionally: in 1518 four Swiss (amongst them Vadius and Myconius) made the ascent: a climb repeated by Gesner with three young men, under the sanction of the town of Lucerne: on their return they were feasted. Gesner, in his description of the ascent, says that all the senses are delighted, but the eyes especially. Nowhere is Nature so sublime as on the heights: the panorama extends over meadows, rocks, caves, valleys, ravines, hills, and scenes in all four seasons. It is the healthiest and noblest exercise for mind and body.

The succeeding epochs find only in the Swiss admirers of the Alps. Joseph Jacob Grasser of Bâle says of the Alps in his Latin description of a tour from Frankfort to Italy through Switzerland (1624): 'Here the painter finds colour but Nature out-does art. The ravines, the tortuous paths, the waterfalls, the bridges, the lakes and meadows and huge trees, earth and heaven are ever fresh, ever astounding and interesting'.

Jacob Scheuchzer, town physician of Zürich (1672-1738) from 1702-1711, used with his pupils to tour in the Alps and could 'testify that the wild lonely spots delighted and aroused him more than Aristotle, Epicurus and Descartes. *Etiam hic dei sunt*, as the pagan philosopher said. The measureless bounty, wisdom and power of God is seized and grasped: the Alps are the armoury of the wonders of Nature; and God's own special temple, far above any human architecture.' He, too, exults in the rearing vistas of meadows and glaciers, valleys and hills. But the heart of the Alps was still unknown, even in Switzerland, and traditionally feared. Scheuchzer (whose writings were utilized by Schiller for his Tell) believed

R.L.M.

D D

the deepest crevices were occupied by dragons, varieties of which he depicted in his *Natural History of Switzerland*. In 1751 the Swiss believed in a sea of ice from Glarus over the Gotthard and the Grimsel to Lauterbrunnen, whence the glaciers were off-shoots. G. S. Gruner of Bern, in his exhaustive three volumes on the *Ice-Mountains of Switzerland* (1760), 'lacks words to express the horror of the great heights'; Guttanen, a pleasant valley, is described as 'combining all the terrors of Nature'.

Travelling, when it revived in the sixteenth century, aimed at utility rather than enjoyment, and only knowledge could be an incentive to dangerous and costly journeys. 'Traveling', said Muret (1526-1585), 'is useful and pleasant; but the wise man follows Horace's maxim, and praises foreign lands from his own home'. But the letters of Justus Lipsius (1547-1606) shows that after 1550 the grand tour was the finishing touch to a gentleman's education: in 1578 he writes from Antwerp to Philip Lanoy at Douai, approving his intention of going to Italy: 'Of old, and nowadays, great men have always travelled'. But the use of any sensible voyage was increased knowledge of manners and customs and constitutions of foreign lands, and a broadening of the mind. He recommends in Italy the places of historical interest, and the study of the social life, and scarcely refers to the country, 'which in Italy is varied and beautiful'.

Similarly, Caspar Stein, a physician of Königsberg (1592-1652), composed an account of his European travels from 1612-1621 in an (unprinted) work, entitled *Peregrinus, sive Peregrinator terrestris et coelestis*. Martin Zeiller, the seventeenth-century Baedeker, published a series of special handbooks for Germany, England, France, Italy, Spain and Hungary, and a *Fidus Achates* (Ulm, 1653, 16°.) containing 160 itineraries. He, too, only mentions the sights (divided into the three categories of ecclesiastical, secular, and private), and practically only deals with the towns. In the *Mercurius Helvetiae* of Dr. J. Wagner of Zürich, 1701, entitled 'An exhaustive description of all places, cloisters, and castles alphabetically arranged', not a word is said of the mountains. Nature was an incidental pleasure, not worth recording in a guide-book.

Up to the eighteenth century, the mountain-world was

practically unknown to the cultured of Europe, partly as being inaccessible and uncomfortable, and partly the rugged rather frightened than allured. Thus the feeling of Nature, being crippled, was narrowed down by its own limitations.

This is not inconsistent with earlier expressions of liking for distant views of hills. Conrad Celtis (1459-1508) praises a lofty castle and the delightful banks of the Neckar near Heidelberg, and also the panorama of the Alps, visible on the heights near Freising above the rushing Isar. Leonhard Rauhwolf (1573-76) liked standing on the flat roof of a Maronite cloister in Lebanon, and thought it 'the fairest spot, in view of the high snowy mountains; especially at daybreak, with the cedars in sight, and other hills, used as pastures, with the dark deep valley below'. There is no sign of romanticism in this; for the ancients recognized mountains as backgrounds.

A newer feeling is manifested, as J. Burckhardt pointed out, in a letter of Mme de Sévigné, 'who felt the full spell of landscapes near and distant. In many of her letters one may remark her delight in the beauty of trees and woods, the golden autumn-tints, the sunset-hues and the moonlit nights. But on her travels her outlook is widened, and she is almost alone in enjoying the scenery on the lower Seine and Loire, and the outlines of Mont St. Michel. Of the lofty Grignan and Mont Ventoux, which looks out over Provence and Languedoc, she says (3rd July, 1689): '*j'aime fort tous ces amphithéâtres*'. And even in a hard winter when Grignan was all snow (3rd February, 1695): '*nos montagnes sont charmantes dans leur excès d'horreur*'; and she longs a painter to depict '*l'étendue de toutes ces épouvantables beautés*'. Addison's Travels (1701-1703) in Switzerland and Italy also betray the awakening of the newer feeling. The tour of the Lake of Geneva, which took five days, aroused his wonder. The views of the Alps from a Carthusian monastery at Ripaille, 'with the many rugged peaks and precipices, filled his soul with a sort of agreeable shuddering at this most misshapen scenery'. He was apparently surprised that the terrible could be beautiful. H. C. Brockes, the author of *The Earthly Pleasure in God* (1680-1747), saw the Alps in 1703, and felt a mixture of fear and delight; he calls the ice-floes gruesomely beautiful; many years later in the

Harz he recognized anew that the rude mountains inspire at once terror and pleasure.

Lady Wortley Montagu (1690-1762) fully understood and liked wild beauty. True, she speaks of the 'frightful precipices separating Bohemia and Saxony, and the horrible Alps so much talked about'. She describes crossing Mount Cenis (25th September, 1718), as a 'prodigious' view of mountains of eternal snow, clouds far beneath her, huge waterfalls whirling confusedly from the cliffs, which would have been 'entertaining' to her, had it not been so intensely cold. In a letter dated the 11th December, 1758, from Venice, she intends visiting the unknown Tyrol, from the reputation of its beauty: she had always most loved valleys set in with high hills. Her favourite spot was Lovere, on Lake Iseo, shut in by unsurmountable hills and enchantingly remote, and she calls it the most beautiful romantic region that she has seen. Whilst sailing down the Danube from Regensburg she enjoyed the kaleidoscope of populous towns and romantic desolations, isolated from all human traffic, and the shores with their delightful variety of woods, rocks and hills, planted with vineyards, cornfields, cities and ruins.

Gray (1716-1771) had the full modern feeling: as his impressions of the Grande Chartreuse near Grenoble show. On the one side, a rock overgrown with trees, on the other a sheer cliff, a thunderous torrent and a deep precipice gave him the sense of the most romantic and marvellous scenery he knew of. Every torrent and rock seemed full of poetry and religion to him; and ought to convert atheists; fancy could easily see spirits there at noon even. According to H. A. J. Munro, a visit to the Lake District filled him with the same sense of the picturesque. Scott is wrong in attributing to Gray in *The Fair Maid of Perth* (chap. i) the expression 'beauty in the lap of terror': he was thinking of Shelley's, 'A tranquil spot that seemed to smile, even in the lap of horror' (*Alastor*).

But as long as Switzerland was a mere stage on journeys and a difficult one at that, such emotions are few and far between. In *Grandison* (1753) the passage from France to Savoy, from spring to winter, was a mere experience of snow and biting cold winds; and everything seemed 'excessively miserable' in that 'worst of lands' Savoy. But less inclement conditions in a hurried journey did not create

a more favourable view. For the most part the ancient feeling reigned unchecked ; and to most travellers the Alps inspired only horror. Even President de Brosses (1709-1777) in his *Lettres d'Italie* follows Misson, the author of a popular guide to Italy in four volumes, in seeing only bad cobbled roads, and in preferring the fertile plains : but he shows very little feeling for Nature. He considers French gardens better than Italian, of which few equal St. Cloud and Marly, and the waterfall at Tivoli better than the one at Terni as more accessible.

Thus, too, in the popular description of his travels through Germany, Switzerland and Italy, from 1729-1731 by J. G. Keyssler (a third edition was published in 1776). He makes much mention of natural features, such as the waterfall at Terni, the view of Genoa from the sea, and delights in distant views ; but his strongest epithet of admiration is 'pleasant', and he prefers any fertile tilled plain to the most magnificent scenery, which he does not imagine could be beautiful. Thus he extols the monotonous country round Mantua. 'Panegyric falls flat at this fertile plain, planted with rows of trees and vineyards, especially at this season of nightingales. In Italy such scenery is common, and almost ceases to awake surprise. But I am sure that any one accustomed to the hilly Tyrol, Salzburg, the Harz, the Saxon hill-towns, the forests of Thuringia and Pomerania, the sandy stretches of Silesia, or Brandenburg or Mecklenburg, or the moors of Lüneburg or Westphalia, any one from these suddenly transported to the choicest parts of Italy would be supremely delighted.' The Salzburg and Tyrol Alps, the Lüneburg moors and the Mark pine forests are all branded unfertile or ugly and not 'pleasant'.

In 1729 Haller's *Alps* appeared ; it was inspired by a great scientific exploration in 1728. This poem was very popular (by 1777 it had passed through thirty editions), and 'attracted the attention of Europe to Switzerland, shedding glory on land and people for half a century. The book heralded in the unbroken succession of tourists to Switzerland, admirers, not only of the singular character of the country, but also of its inhabitants'.

For the next few decades this new attention was concentrated on the customs of the country : for Haller painted

the Arcadia of this people of herds, with the Alps as a general vague background. Haller's diaries of his tours in Germany, England and Holland (1723-1727) show how little the poet admired scenery. His sense of it was most satisfied in Holland, a 'very pleasant' country, with straight canals and avenues, gardens, fields and pastures; where no tree grows beyond its measure, no spot is uncultivated. He is most pleased at the moonlit road in Leiden, a long waterway lined with trees. The road from Amsterdam to Utrecht is 'an enchanted land. Every village, every fen is amid gardens and country-houses, the river is full of swans, the land thoroughly tilled; it is a picture of perfection'. He agrees with Johnson that mountains are 'unnatural protuberances on the face of the earth', and includes hills as well: for Heidelberg he finds 'unpleasant, in the valley of the Neckar, between hills'.

Haller's *Alps* did not make foreign tours in the Alps any more frequent. The Swiss patricians even designed their houses with the garden pavilion looking out on the main building, and the wall shutting out the view of the Alps; just as in Coppet the gardens exclude the view of the Lake of Geneva. Voltaire's room at Ferney did not open on to Mont Blanc, because the snow dazzled his eyes; and he never once essayed the climbing of the Alps he could always see. Klopstock from the 23rd July, 1750, to February, 1751, stayed at Zürich, but to Bodmer's astonishment never betrayed 'any curiosity to look at the Alps from near or afar': he only conceived the idea of a tour in the Alps long after his arrival; it was frustrated by an unusually early fall of snow. Klopstock was an enthusiastic Nature-lover, and his neglect of his opportunities shows that most tourists of that time were content with merely seeing the Alps. Gibbon stayed at Lausanne from the 21st September to the 20th October, 1755, and, after two years, made a journey through Switzerland. Foreign visitors used not to climb and look at the glaciers, though they came to see the marvels of Nature. Gibbon's main interest was in the various constitutions of the republics: he visited the principal cities and their churches, armouries, libraries and chief men: his object was to learn men and customs. Haller's *Alps* contributed only indirectly to the spread of the love of Nature, by advertising Switzerland.

§ 2

Konrad Gesner's enthusiasm for the Alps was thus almost unique ; thus, too, the Scottish Highlands were appreciated mainly by their inhabitants. Thomson's warm appreciation in his *Autumn* of the beauty of Caledonia (1729) is similar to the expressions of Burns' poem on the Highlands fifty years later. On the other hand, Captain Burt, who travelled there about the same time, thinks a sandy steppe preferable. Goldsmith ventured so far in 1733 and spoke with disgust of the wilderness : like Haller, he declared the neighbourhood of Leiden incomparable. Johnson in 1773 visited what are now deemed the most beautiful parts and replied, when asked how he liked them : ' Who could like them ? ' He describes the dreary monotony of the treeless moors and naked hills, as only occasionally varied with a sudden waterfall. ' An eye accustomed to flowery pastures and waving harvests is astonished and repelled by the wide extent of hopeless sterility.'

' The appearance is that of matter incapable of form or usefulness, dismissed by Nature from her care, and disinherited of her favours, left in its original elemental state. . . . It will very readily occur that this uniformity of barrenness can afford very little amusement to the traveller ; it is easy to sit at home and conceive rocks and heath and waterfalls : that these journeys are useless labours which neither impregnate the imagination, nor enlarge the understanding.' ' Had Loch Lomond been in a happier climate, it would have been the boast of wealth and vanity to own one of the little spots which it encloses, and to have employed upon it all the arts of embellishment. But, as it is, the islets, which court the gazer from a distance, disgust him at his approach, when he finds, instead of soft lawns and shady thickets, nothing more than uncultivated ruggedness.'

Macaulay, who quotes Burt and Johnson, makes the reason of this blindness their insecurity. This may have been a contributory cause, but Thomson's enthusiasm belies Macaulay's assigning the distaste to this one fact. The German mountains, which Keyssler disdained, were safe and convenient : and modern travellers face danger to see Lebanon or the Cordilleras, or the heart of Africa. Despite Dr. Johnson, according to Isabella Bird, the North American mountains excite fancy and exalt the spirit.

In the early eighteenth century, Romance in scenery was almost unfelt in England. The English officers at Fort Augustus longed to be released and free from the wind and rain of July : for there was no sun, only a dark sky and dun rocks, clouds of rain, ice-cold winds, the roar of swollen waters. De Foe's *Tour through the whole Island of Great Britain* (1724) scarcely contains one reference to the beauty of Nature.

The publication of Ossian's poems in 1760 developed the taste for the Highlands ; they were full of the passion for the sombre and desolate in Nature. Werther replaced Homer by Ossian in his heart and cries out : ' What a new world he guides me into ! I wander on the heath, with the storm piping in my ears, and see it wafting the spirits of my forebears in cloudy shades under the dimming moon ; I hear the mountain stream roar down and in its flow the gnomes groan in their caves, and the laments of the maiden weeping unto death round the four moss and grass-grown stones of her lover's tomb '. This mood was the mood of the Highlands.

The new romance was born, but had to struggle for existence. A hundred years ago the beauty of the Highlands was far from being absolutely admitted : Dr. Beattie (1735-1803) says : ' The Highlands of Scotland are picturesque, but in general a melancholy country. Long tracts of mountainous desert, covered with dark heath, and often obscured by misty weather ; narrow vallies thinly inhabited, and bounded by precipices resounding with the fall of torrents ; a soil so rugged and a climate so dreary, as in many parts to admit neither the amusements of pasturage nor the labours of agriculture ; the mournful dashing of waves along the firths and lakes that intersect the country ; the portentous noises which every change of the wind, and every increase and diminution of the waters, are apt to raise in a lonely region full of echoes and rocks and caverns ; the grotesque and ghastly appearance of such a landscape by the light of the moon ; objects like these diffuse a gloom over the fancy, which may be compatible enough with occasional and social merriment, but cannot fail to tincture the thoughts of a native in the hour of silence and solitude '.

§ 3

Thus, by about 1750, the feeling for the romantic and

terrible in Nature had made some progress, especially in the mountainous lands: but Rousseau was its first real founder and celebrator.

The lake of Geneva, his birthplace, was the aptest place in all Europe to engender a new feeling for Nature. The Northern coasts had already attracted nature lovers; 'the lake of Geneva', says Sebastian Münster, 'is girt round with lovely scenery, especially at Vivis'. The beautiful declivities required the severity of the mountains to complete them. 'Genève', says Misson (*Nouveau voyage d'Italie*, 1702, pp. 239), 'est dans une charmante situation. Tout est agréable aux environs; on peut même dire que la Nature y est magnifique. Le lac, les montagnes, les rivières, les plaines, les coteaux, les promenades, les jolies maisons de campagne; tout contribue à embellir le séjour'. In 1728 Haller and Johann Gesner were looking at the Lake from a terrace at Lausanne: he says, 'ce mélange d'affreux et d'agréable, de cultivé et de sauvage a un charme qu'ignorent ceux qui sont indifférents pour la Nature'. Vévey attracted Rousseau in his boyhood, haunted his memory, and became the theatre for his *La nouvelle Héloïse*. He makes the hero in that novel on his return call this 'rich and fertile country the most beautiful human eye ever saw, a residence superior to any he had seen in his travel round the world'.

Rousseau's love of the country was intense and, if anything, over-coloured by his hermit-life and hatred of super-civilization. Nature existed to him wherever man and his sorrows did not invade. 'She seems', says Julie, 'to withdraw her real charms from men insensitive, who pervert them, whilst in the enchanted region'. 'She flees populous resorts, and lavishes her mighty spells on mountain-peaks and in forests, and on uninhabited isles.' Rousseau was never so happy as when, in the glamour of seclusion, he found some forest glade, unprofaned by the hand of man, no mediator between him and Nature. He could only pray in the open, and his prayer was a devout uplifting of his heart to the creator of kindly Nature, whose beauty he might behold. In the solitude of meadows and woods he forgot the persecutions of men, their jealousies and scoldings, and the evils with which they have repaid his tender disposition.

Rousseau loved untouched Nature, but, most of all, wild

sombre scenery. 'Every one knows', he says, 'my ideal of beautiful scenery. No plain, however lovely, realizes it. I want torrents, rocks, pines, dark woods, mountains, rough paths, and frightful precipices'. And as his melancholy grew, so did this passion for savage solitudes. 'Nowhere did I feel so happy as on the lonely Isle of Peter in Lake Biel. Its shores are wilder and more romantic than those of the Lake of Geneva, as the rocks and forests come down to the shore; yet it is not less smiling. Only the eagle's cry, and twittering of birds and the mountain-torrents interrupt the stillness.'

La nouvelle Héloïse (1761) revealed to the world a new source of enjoyment in the Alps. A marvellous descriptiveness disclosed for the first time the delight of regions where (as St. Preux writes in a letter to his beloved) huge rocks towered over the walker's head, and there were lofty turbulent waterfalls involving him in a cloud of spray, an eternal torrent hollowing out a giddy precipice; out of a twilight thicket or a ravine into the full view of a flowery meadow. What enchanted the traveller in Valais was the commixture of savage and cultivated scenery, and, even more, the contrasts and combinations of all seasons and climates. To this manifoldness he ascribed the new peace of his soul, and felt it as the cause when climbing beyond the clouds to a height whence storms thundered beneath his feet.

La nouvelle Héloïse was also epoch-making in teaching all sensitive and weary souls to find refuge from the petty turmoils of men in the still greatness of Nature. The gospel of the charm of deserts to the sensitive, and their horror to the dull, was propagated. St. Preux, in absolute isolation from his love, found his days as charming as they were sad. 'A torrent of melted snow twenty paces away falling into dirty water and sweeping stones and obstacles in its course. Behind us an impenetrable chain of rocks, in the direction of the Alps or glaciers, covered with age-old ice. Black pine-forests with their sombre shadow to the right; to the left oaks; beyond the torrent, and, at the bottom, the endless lake extending from Pays de Vaud, and crowned by the Jura.'

Rousseau caused the popularization and transformation of the feeling for mountainous nature. The *Nouvelle Héloïse* made subjective appreciations of Nature usual. Nature

was invested with a soul, larger than that of man, and a language and a meaning in her eternal changes: 'in the high hills, and lonely woods and valleys was a dumb reflection of herself'. Rousseau's individualism stood in opposition to German regulations of life, introduced by the *Sturm und Drang* period, and directed attention to a Nature previously neglected. The melancholy broodings of the next generation corresponded with the unclassical romantic in Nature. Rousseau's hermitage at Meillerie was the prototype of the scenery henceforth sought after.

La nouvelle Héloïse and his other writings had the effect of advertising the Lake of Geneva and West Switzerland. In 1763 Justus Möser wrote to Abt, after reading the book, that he might send him back something of these wonderful Alps. In 1779 Goethe almost wept on seeing Meillerie, the 'dent du Chamant' and all the lively scenes of Rousseau's lonely life. In 1788 Meiners made a 'pilgrimage to the theatre of Héloïse, as did all travellers to Lausanne and Englishmen in especial, *Héloïse* in hand'. Coxe's *Travels in Switzerland* and in the country of the Grisons (1776, 79, 85, 86) was the guide-book of that time and followed Rousseau's footsteps.

Coxe's book was translated and amplified by Ramond de Carbonnières (1755-1827), a master of words and an expert on mountains. Coxe discoursed mainly on the plains and valleys, the cities and the customs. Ramond gave first place to the heights which he had climbed. Ramond also attempted to acclimatize Werther in France in his *Aventures du jeune d'Olban* (1777), dedicated to Lenz, and afterwards wrote classic works on the Pyrenees, *Observations sur les Pyrénées* (1789), and *Voyage au Mont Perdu* (1801). Sainte-Beuve says 'that Ramond as the Saussure of the Pyrenees painted quite new canvases: that he wanted men to have the courage of their feelings, and express their great natural thoughts freely'. Nothing mountainous frightens him.

Ramond wrote at an inopportune time, and he is almost forgotten, save in France. So, too, Étienne de Sénancour (born 1770), who described the Alps in his *Oberman* (1804), and was a second Ossian and Werther: his style is mediate between Ruysdael and Salvator Rosa. The discoverer of the charms of the heights after Rousseau was Saussure of Geneva.

Töpffer of Geneva (1799-1846) properly divided the Alps into three zones : the lowest including the hills up to the nut-trees, the limit of Rousseau's explorations ; the second more severe and difficult, and desolate ; pines and larches grow in it, and there are ravines and torrents ; alive with the charm of the wild. The third is the ice-region, with only Alpine roses and hardy bushes in the crevices or bordering on the eternal snow. This third region Saussure discovered. In antiquity and modernity naturalists and botanists were the first to approach and learn to love the Alps.

In 1741 two Englishmen, Pococke and Windham, discovered Chamouny, but for twenty to twenty-five years the place was seldom visited, and only by the English. In Homan's splendid *Atlas Novus reipublicae Helvetiae* (1769) Mont Blanc and the older Montagne Maudite are not found ; under the *glacières de Faucigny*, the words 'Here are terrible glaciers and ice-mountains.'

Saussure, an ardent student of the High Alps, began exploring at Chamouny in 1760, and ascended Mont Blanc in 1787. Like Ramond, this indefatigable climber and naturalist was also a master of the pen : his simpler style effectively gives an impression of that scenery, unviewed until then of any mortal eye, and unparalleled in Nature, and communicates to his readers his mixture of terror and wonder. He realized for the first time on those immense heights, with the stars barely illumining the peaks and only marking the distances and the rocks, their brooding silence and fantastic terror : 'I seemed to have survived the universe, and to see its corpse at my feet'. The tale of the dangers overcome made his work inciting to the adventurous.

Besides Saussure, there was also another enthusiast, Bourrit, whom Frederick the Great called *l'historien des Alpes*, who directed attention to Chamouny and the high Alps. He was a painter of Geneva and dedicated his whole life (1739-1819) to the exploration of Mont Blanc : Saussure in 1773 acknowledged his own work as a preparation for these scientific memoirs. Goethe ascended the Rigi before 1775, one of the first foreigners in Switzerland to do so, and heard on his Alpine journey of 1779 with Karl August of Weimar so much of the wonderful Savoy ice-mountains, that he followed Saussure's advice and made an excursion

to Chamouny. In 1784 Gibbon complained Lausanne was not so peaceful ; but was invaded by strangers, attracted by the beauty of the Pays de Vaud and the fashion for mountains and glaciers. In 1755 he had toured in the low-lying towns of Switzerland and in 1791 went with Lord Sheffield by Geneva, Chamouny, Col de Blanc (much-climbed for the view), Martigny, St. Maurice, round the Lake of Geneva to Vévey and Lausanne. In 1790 Switzerland, sixty years before almost unknown, became the playground of Europe, and at Chamouny the natives had become wearisomely ready to oblige.

But Saussure interested the many more, who could not themselves see the Alps. Kant was one of his most zealous readers. He never left East Prussia, but recognized 'in the sombre melancholy wilderness of his home the interesting dreariness of a desert' ; and 'heaven-high hills, deep crevices and rushing waters' stirred his imagination, in abstracting the idea of the noble in Nature. In his *Criticism of Judgment* he says : 'That nobility does not consist in any natural thing, but in our mind, in so far as we become conscious of our superiority to Nature in us and outside us, as much as is known to us'. He also indicated that agreement was less likely on the noble than on the beautiful. Had he known that the cultured up to the eighteenth century all concurred with the Savoyese peasant who called the lovers of the Alps fools, he would have recognized that the judgment of the noble depends on the direction, as well as on the degree of civilization. If Schopenhauer is right in making the basis of the 'serious and noble more' induced in us by mountains, the fact that their shape is the most permanent line in landscape, their sight could not have been so differently regarded at varying epochs.

It is not pertinent to trace the history of Alpine travelling down to the present day. Literature and art have exercised themselves more and more with the Alps. 'This Science of susceptibility of Nature', says Ulrich Hegner (1822) of Winterthur, 'is neither natural science nor geography, was unheard-of fifty years ago, even in novels or tales of travel, and has grown up mightily in Switzerland, bearing fruits easy to pluck and digest'. Alexander von Humboldt and Karl Ritter have put Alpine science on a sounder basis. Art adventured later into the Alpine field than literature.

§ 4

Thus the change of feeling corresponded with the *Sturm und Drang* period in Germany. Keyssler called the Salzburg and Tyrol Alps as dull as the Lüneburg moors: Meiners' letters on Switzerland (1790) presuppose the supreme beauty of Switzerland, as the most mountainous country in Europe: the difference is absolute. 'These wastes', K. V. von Bonstetten writes in 1780, 'of rocks and ice and forests will please you more than the soulless beauties of the plains'. Nicolai even is filled with this passion. Travelling from Vienna to Munich he writes: 'Nature in her majesty is more inspiring than anything human, and especially in mountainous lands'. In the nineteenth century the beauty of mountains in themselves becomes a general dogma. Moltke knows of only one exception, the Caradja Dag between Frat and Tigris. Mountains, according to Ruskin in a chapter headed Mountain-glory, are created to portray perfect beauty; they combine the elements (form, colour, variety of scene, etc.) infinitely more than the plain, which they excel as does a painted window a white window. They ennoble and inspire mankind, are their school and cathedral. Down to old age he remained true to his adoration of mountains. Lord Avebury also says that mountains are the alpha and omega of scenery.

The survivors of the old generation still demurred. At the end of the eighteenth century, J. C. Füssli, of Zürich, the author of a Description of the Swiss State and Country, thought the Engelberger valley could not be deemed beautiful, 'with its hideous mountains, and lack of gardens, fruit-trees or anything to please the eye'. Foreigners were often of that view. Goethe's father was angry with his son for coming back from the Gotthard without seeing Italy. 'He did not share any affection for those wild rocks, seas of mist and dragons' nests. He remarked as before *vedi Napoli e poi mori*.' Goethe in his old age returned to the older conception. In 1823, in a letter to Nees von Esenbeck, he speaks of his 'useless journeys to Switzerland and his belief that he had done something by seeing mountains'. He calls this the merry paradox of a worthy man. 'When travellers take a delight in climbing mountains, I regard the mania as profane

and barbaric. Mountains impress us with their grandiosity, not with the idea of a Providence. . . . These zigzags and irritating silhouettes, and shapeless piles of granite, making the fairest portion of earth a polar region, cannot be liked by any kindly man.'

But the few of the younger generation who objected to the new enthusiasm were consciously in a minority. Such was Hegel (born 1770), who visited the Bernese Oberland in 1796. He found the roads from Interlaken to Lauterbrunnen oppressive, as the narrow valleys shut out the views of the mountains. He longed for space, and saw only rocks; and was wearied by the eternal roar of the two Litschenen. On the Scheidegg, the Jungfrau and the two Eigers did not arouse the feeling of majesty he had expected. Of the region about the Grimsel hospice he says: 'these dead masses only impress me with a wearisome sense of unalterable fact'. He was most interested in the waterfalls and was very glad to return to Lucerne with its lower hills, the lake and its reflections, which delighted the eye nauseated by grey lofty mountains, without any wide view.

This affirmation of an independent mind remained unknown, for Hegel's diary was not intended for publication. In 1805 Chateaubriand in his *Voyage au Mont Blanc* raised a protest against the admiration of mountains. 'He had seen many in Europe and America, and had always thought their claims exaggerated', an opinion confirmed by a visit to Chamouny. He holds that every landscape requires a background of hills, and spaciousness: no interior mountain views fulfil both necessities. The large objects are too near to be seen in their true perspective, and the mountains are too huge to be decorative. Further, the snowfields obscure the whole region and the sky, which is hardly seen, and is essential as the canvas on which Nature paints: Art appreciates the fact and brings in hills as a background to woods and plains. In moonlight the grandioseness of the mountains can be seen. But if the grandiose and its majesty are lacking in the mountains themselves, so is all grace. Swiss valleys are only comparatively pleasant. The feeling of the mountains is disagreeable, as they are rough and unfertile. Virgil's valleys, the haunts of the Muses, are smiling and charming; his woods are forests of oaks, elms, beeches, not dreary pines,

and his valley is laid in a place of historical and poetical memories: he would hate Chamouny with its glaciers and peaks and the Tête Noire. Antiquity, the source of true inspiration, thought otherwise than Rousseau, and makes mountains the home of pain and despair; as did also Scripture.

Finally, Chateaubriand repeats that, as backgrounds, mountains are essential. 'Their snowy heads, naked sides and huge limbs are hideous from a near view, but marvellous when rounded off in a golden light on a dark horizon. . . . I cannot be called upon to love lanky ridges, crevices, ravines, caves and tortuous Alpine valleys.'

Chateaubriand is right in invoking the ancients, with whom he is in full accord. But we have shown that the feeling for Nature is largely determined by the nature of the home. In a Switzerland or Scotland, love of the mountains comes to birth sooner and more swiftly than among the dwellers on the plain; thus Southerners would be the last to like the Alps.

Thus the contrast between us and the ancients is really that of North and South; and, if so, the modern Italy and the South must still confirm this view. And actually the Italian eye, spoiled by their richer and more harmonious climates, finds mountain-lands vast and depressing. 'There', says Ugo Foscolo, 'Nature rules alone, and sullenly drives forth every living being'. Educated Italians often, if not always, voice this view.

Northerners, who live long in the South, may become infected with the Southern feeling. 'You are satisfying your imagination', the Duchess of Albany writes to Foscolo in 1816, who had retired to Switzerland, 'instead of having it frozen by the snow. It requires a strong inducement to any one born at Zante to live in such a country'. Stendhal, describing Lake Como, says that the distant view of the eternal snow of the Alps gave a necessary fillip of melancholy to the pleasant scenery. Victor Hehn, in his book on Italy, treats of Italian scenery with masterly comprehension, and, as a consequence, dislikes Switzerland. 'For there mountains tower with lofty, desolate, swampy plains, trough-shaped and covered with scanty grass: midden-heaps descending into the valleys, and dreary ridges of stone: mist and clouds

on the flanks, and stone ribs, like the wool on a wether's belly, down to the dark girdles of pines and tumultuously upwards to the cold snow-crests, a picture of shapeless, limitless form ; a memory of bygone elemental struggles.' But, in Italy's mountains, 'the hard egoism and proud Titan spirit has been tamed : the shapes are rich and gentle, plastic, wave-like, yet also energetic'. In the Southern Alps are 'the mountains most pleasing to the eye ; which have flowing lines, are gay, cut off sharply as against the sky, or swathed in light on the horizon, and send out low tongues to greet the sea'. Any one who has seen Italy can understand that the recollection of the 'lines of the hills, the modelling of the earth, the coloured shores, the resounding sea, and the harmony and self-sufficiency of the classic regions, cannot desert their devotees, and charms them against the North'.

Generally Southerners had a distaste for mountains. Winckelmann was deeply impressed when he first saw the Tyrol Alps. 'Not to have seen this country with my eyes', he writes (7th December, 1755), 'is not to have seen anything wonderful'. He calls the mountains terribly beautiful (20th December, 1755). In the Tyrol, 'Mother Nature is most lavishly great and fertile between her cliffs. Bozen especially is a land of beautiful men. On my return I shall stop here on the way' (1st July, 1756). But, later on, the South captivated him. He is always writing on the magnificent vegetations in the gardens of Rome, the indescribable beauty of the Albanian Hills and the Latian coast, and the Elysium of Porto d'Anzo. For twelve years he gazed on Italian scenery : in 1768, he returned to the Tyrol, and saw no charm in it. Once when Cavaceppi had been with him an hour in the Tyrol Alps, he observed a change in Winckelmann's features. He cried out : 'What a frightful country ! Those endless mountains !' This conversion may have contributed to his melancholy on entering Germany. So, too, with Niebuhr. In 1823, after seven years at Rome, he entered Switzerland, and the mountains, rough and shapeless, revolted him : he preferred the Tyrol, which he had seen in 1816 before Italy, like Winckelmann ; as a fact, the Tyrol Alps are the more broken. Gregorovius was eight years in Italy, and in 1860 wanted to return on the disagreeable sight of Switzerland. He calls (1862) the Engadin a monster

R.L.M.

E E

of coldness and dumbness, and the mountains round the Vierwaldstättersee shapeless. So, too, Rudolf Delbrück travelled to Constantinople, taking from the 3rd May to the 16th June: he says, in his *Memoirs* (II, 1905, p. 296), 'on crossing Switzerland I experienced, and have since confirmed the feeling, that after the colours and shapes of the South, Switzerland does not please. I think of the blue sky, the gleaming sea, and the lines of Corfu, Palermo and Naples'.

§ 5

The character of Southern scenery should then determine the Southern feeling for Nature, in so far as the landscapes are similar. Fernán Caballero says of the view from Carmona in Andalusia: 'The glory and suddenness of this view would be a theme of poetry and literature in other lands. But in Spain taste and love of scenery is scarce; admiration without enthusiasm is the rule. Views are regarded from the classical, and not from the romantic aspect'. Thus this lack of feeling is a lack of romantic feeling; and the fact that Spanish has no native term for glaciers, though the Andes are in Spanish territory, shows a lack of interest in mountainous Nature.

The Eastern world, being more akin with the Southerner than the Northerner, shares the Southern feeling for Nature. The Arabic garden was like the ancient garden, 'all art, all in the rigid oriental form'. They love straight paved walks at right angles, oblong flower-beds with stone settings, and well-trimmed scented bushes at the edges, and straight angular trees: everything stiff and formal, with cascades and marble fountains. In the garden of Chomâravaih, the Fatimite ruler, at Cairo, the palm-trunks had iron plates let in, and pierced with pipes, which shed water from the trunks. On the public places, the garden-beds were arranged in designs. Almonds were grafted on to apricot-trees. In a pavilion cascades flowed from the pillars, and birds nested. Peacocks, guinea-hens and rare birds stalked about in the garden. In a garden laid out by Abd-er-Rahman III (who died in 961) for a favourite slave, near Cordova, avenues of myrtles, laurels, olives and fruit-trees were laid out round translucent lakes. The flower-beds were alive with most

lovely and fragrant blooms : the parks with rare animals ; there were aviaries of bright-hued song-birds, marble baths, a kiosque in the centre on a hill, with a delightful view. The garden of Shah Yehan (1628-1658) at Lahore, called Shalimar, is ' obviously designed by Arabs. In the squares between the walks there are thickets of mangoes, fig-trees, and oranges. Marble balustrades surround the great pond. Marble bridges lead to the marble kiosque in the centre. The marble is as white as freshly fallen snow. Everywhere water and shade. The pond reflects stonework and bushes. And above, the golden Indian sky.'

The ancient Persians laid out round the palaces of kings and satraps parks containing wide meadows and rills and game ; the Persian word *pairidaeza* is the origin of Paradise. This is the style of the parks of Kublaikhan (1214-1294), whom Marco Polo visited. Libanius, also, mentions this palace with all the ' beauty of Persian gardens : it lay by a river, and was full of splendid trees and flowers'. This feeling towards Nature scarcely changed with the ages. Modern Persians still delight in flowery gardens and shady walks and green banks and cool streams. A volcano or snowy ridge or strange mountain formation scarcely arouses their interest. Paradise in the Koran is very similar to Elysium in the Pagan poets ; Virgil may have suggested it : Virgil's Elysium emphasizes the shady avenues, the river banks and the meadows watered by brooks. The four Gardens of the Blessed in the Koran are decorated with trees affording deep shadow, have many rich wells and fruit-trees, which can easily be plucked by the blessed, who recline on gorgeous pillows.

But the Further East has a feeling for nature more akin with ours. In China and Japan, scenery is universally beloved. Marco Polo describes the holidayings of the inhabitants of Quin-Sai (Hang-Chéu-fu) to the neighbouring lake to enjoy the changeful beauty of the scenery. To this day the Chinese give parties to admire a moonlit night, a fine view or a rare flower. But long journeys to beautiful districts are not shunned, and the mountains of Su-Chéu are as frequented as Interlaken. The descriptions of Nature in Chinese poets medieval and modern are strikingly like Matthiison and Lamartine. Chambers described Chinese gardens in

1757, and Kent (d. 1748) designed the English garden : Chinese gardens have influenced English. The style introduced under the Ming dynasty, and still in vogue, is far from being regular or stiff. Groupings of rocks and trees are brought in, and lakes framed in with flowers : and there are little bridges and sinuous paths. The names of the enchanting, terrifying and delightful gardens show the strivings of Chinese art after character in landscape. 'A garden', says a Chinese writer, 'is a substitute for man's natural habitation, the ever agreeable fields. A garden should then be the model of all Nature, so as to arouse in the soul similar feelings'.

In Japan, too, the finest views are frequented by visitors, and the sense for nature and art is distributed widely, in the lowest classes even. A man too poor to decorate his home with the snowy peak of Fujiyama and the pear-tree will still have his apricot, his dwarf-cedar, and his little waterfall. They have flower feasts and exhibitions, and landscape-gardening is highly artistic.

In ancient Mexico, the sense for Nature was highly developed. Montezuma's many summer-palaces had large gardens with groups of flowers and trees. Many had artificial rockeries, chases, galleries, ponds with diving-birds. But human figures were made of leaves and flowers, and decoration was mostly tasteless.

Generally any detailed study of the different feelings for Nature will show that every people loves its home-scenery. Scott's wild borderland was ugly to Washington Irving : Scott loved his grey ancestral hills and thought he would die, should he not see them for a year. Every people loves its own nature. The Indians of Mexico have masses of flowers in front of their huts : the Polynesians 'find flowers as necessary as air'. The Indians of Nicaragua, according to J. Fröbel, show more taste in the floral decorations of their dwellings than the Europeans ; they choose every most beautiful bloom. The Lithuanian delights most in his native birches and willows, which he worshipped late into the eighteenth century ; and plants them round every new building, and will not fell them save in direst need. The mountain-dweller is at home only in his mountains, and the marsh-dweller in his marshes ; he longs for his level cornfields and pastures and undefined horizon. So, too, the Southerner

loves his gorgeous Nature. True joy, Dr. Friedrich Preller wrote at Sorrento in 1860, and love for one's own paradise are still alive in modern Italy. A Neapolitan boy alarmed Goethe by his cry of admiration of the Bay of Naples, and apologized, 'Signor, perdonate, questa è la mia patria'. Nansen found the Greenlanders keenly alive to the beauties of arctic Nature. When passing a mountain-peak with a native, Joel, in a Rajak, the sun fell on the glistening snow ; and Joel stopped towing and exclaimed 'binne kack' (how beautiful !)

§ 6

These considerations prove that the feeling for Nature of the ancients was more restricted, and altogether lacked the subjective comprehension of her, first spread by Rousseau, which gives Nature a soul, and makes her reflect our soul. Antiquity, however, also lacked the aesthetic appreciation, which sees in Nature an artist's deliberate and individual work. This view is also modern ; painting based on it occurs in the sixteenth century, but it was communicated to literature much later. It is found fully expressed in Diderot (in his criticisms on the Salons from 1765-1767), who, describing Vernet's landscapes, appears to speak of real scenery, but uses epithets applying only to pictures. He loved historic landscape above all, and Poussin, as one of its masters : his enthusiasm for Nature was limited, and, like the Roman, shared, as he believed, but by few.

Little as is known of ancient landscape painting, it is certain that, despite the stylistic delineation, its development was too poor to foster an aesthetic description of Nature, such as has arisen in our day. But the principal difference was the complete lack of the effect of light and its modification in air. In Aelian's description of the Vale of Tempe (borrowed from Dikaiarchos), he speaks of the colour, the refreshing green, but never of the atmosphere and its effect : the tone is topographic and plastic. So, too, in the sceneries, described by Apollonius Rhodius, Pliny the Younger, speaking of his Tuscan villa, mentions the *regionis forma pulcherrima* : it seems a picture rather than reality ; he has the features of the country in his mind, though he knows its effect depended on the colours. 'All these descriptions give an impression

of implying clear air and full light, which would bring out the plastic qualities.'

Here and there, however, there are expressions of emotion for varying light-effects ; for the clear moon, rippling on the sea, making the water quiver, and refreshing the dewy woods at eventime : for the sea red in the rays of the sun, and the empurpled waves : the dew in the golden morning light, like diamonds on the grass, when pools and streams and the earth give forth mist. But these uncertain pictures, though like modern descriptions of Nature, are all of single scenes. Of the general effect of light on landscape there is no mention ; nor of perspective and the shades between cold moonlight and the hot sunset glow ; nor of the wonderful colours, which wreath the horizon and hills of the South in the morning and the evening, from pink to deep blue. No such expression as 'blue hills', 'twilight distances', is found in ancient poetry, to call forth a distinct colour picture, like the one in Faust :

Down on the silenced world to gaze
In the undying evening-glow !
At rest each dale ; the heights a-blaze ;
The silver brook's bright golden flow !

None of the inscriptions of the statue of Memnon mention the effect of the dawn-red on the landscape. Ovid saw Rome for the last time by moonlight : a modern poet would have warmed on this theme : he, discursive as he is, hardly mentions it ; only expatiating on his tearful departure. Tacitus says that in a night combat between the Flavians and the Vitellians, the moon rose behind the Flavians : his object is merely to illustrate the difficulties ; he is not thinking of the picturesque effect, a liberty any stern but artistic modern historian, like Tacitus, would have permitted himself. Virgil compares Aeneas' journey through Hades with a walk through a wood by the deceptive moonlight, and never indicates the artistic pictures. But he lets the Penates appear before Aeneas in full moonlight, to be seen as plainly as possible : he feels nothing weird in moonlight : a modern poet would have had a mysterious twilight.

The same difference may be presumed between ancient and modern landscape, on the authority of Philostratus' descriptions of pictures. 'The ancients laid most stress

on the local and plastic element, and strove after clear significant forms to make an organic whole: the effects of light and air were secondary, and could never have taken the modern primacy.' 'The vague dreamy and mysterious, as obtained by atmospheric effects, is utterly foreign to the sharp and clear classical spirit. Artistic realization of such impressions presupposes a sentimental love of Nature, unknown down to very recent times. Further, the sky in the South is clearer than in the North, and less prolific in these misty effects. Lastly, ancient landscapes could all the less attain the colour reached by realizing atmospheric effects, as artistic grace and plastic perfection, the main object of ancient art, cannot be readily combined.'

The limited travel of antiquity was due to the absence of the Teutonic roving spirit, and also to the slighter feeling for Nature. Only the very few penetrated far into Africa; the islands on the West coast were never visited: fabulous India scarcely attracted the Romans. Every year fleets sailed from Alexandria to the Malabar coast, but the frequent opportunity was in the first two centuries seldom used. Dio of Prusa gives second-hand evidence on India: his informants only sailed in the course of trade, and never went inland. Now and again an adventurous journey might be made: Lucian tells of a young Paphlagonian who studied in Alexandria and was persuaded to go on to India with a boat sailing to the end of the Red Sea. The object was not to see the tropical world, but to learn of the Brahmins, who, like all the barbarian philosophers, had attributed to them extraordinary wisdom, on the authority of a view held in Alexander the Great's time and confirmed by the peripatetics. For this reason Philostratus makes Apollonius of Tyana make a pilgrimage to India: his authorities were oral or written Alexandrian reports. Possibly, after the second century, Greek philosophers occasionally went to India to study under the wise men. Lucian tells this of an Attic cynic, Demetrius. Plotinus, who joined Gordian's expedition to Persia in 242, in order to learn something of Indian and Persian philosophy, managed to escape to Antioch, after the murder of Gordian. The visit of Metrodorus the philosopher (of Persian origin) to India in the first half of the fourth century had the same object: he is said to have

succeeded by his reserve, and his communications of discoveries unknown to them. St. Jerome knew that, according to the Indian gymnosophists, Buddha had been born of a virgin. But these journeys, whatever their number, must have been exceptional ; and their aim precluded the study of the tropics.

The infrequency of travels to distant and tropical countries and the lack of incentive to them reacted on each other. Humboldt specifies three great incentives ; poetical descriptions of Nature, landscape painting and the cultivation of tropical plants. He was impelled to tropic travel by Georg Forster's Descriptions of the South Sea Islands, and pictures of the shores of the Ganges in Warren Hastings' house at London, and a huge dragon-tree in an old tower in the Berlin botanical gardens.

This chapter has shown how antiquity lacked all three incentives. Descriptions of Nature aiming at reproducing and conjuring up the impressions of a scene, such as excited Forster and Humboldt, are very modern and involve a combination of science and powers of narration. Pictures of scenery, which might excite a desire of more distant lands, in Roman times only dealt with Egypt. Exotic plants were scarcely cultivated. In their hot-houses Romans forced fruits and flowers in the winter. Of the 'foreign trees which will not grow outside their own country', palms in antiquity and in the Middle Ages were commoner than now (except for palm-wood at Bordighera). In 291 B.C. they are mentioned at Antium, and may have been grown in the Greek cities on the West coast, beside temples of Apollo. In Pliny's time they were common in Italy. Petrus de Crescentiis (born in 1230) in his work on horticulture for all classes recommends planting palms (which must have been reintroduced by the Saracens). The fruit-trees from Asia, acclimatized under the first Emperors, apricots, peaches and pistachio, soon became native, but lemons did not grow in the open before the fourth century, whilst oranges and several other plants, now deemed characteristic of Italy, were unknown in antiquity. In gardens there would be a few medicinal and foreign herbs and decorative plants, like the pepper-tree, the incense-bush, the leafy cassia, myrrh and crocus, arranged as little microcosms of tropic vegetation.

The difference of feeling of the present day and antiquity

is most strongly seen in the gardens. In the Augustan and post-Augustan times free Nature found a few spokesmen: but, generally, down to the fourth century artificiality in gardens was the rule. In Pliny's descriptions of his Laurentine and Tuscan villas the gardens are laid out in architectural lines with contrasts of pure country. The garden was divided by terraces, and round spaces (*hippodromi*), and straight or curved walks; these were marked by clipped hedges of box or rosemary, and occasionally went in steps. Architecture and greenery combined to beshadow the nearer parts, as well as the more distant; and views were carefully contrived. Decoration consisted of statues of men and animals, ponds, canals, fountains: in Pliny's Tuscan villa the water rose from a semicircular marble bank through pipes, as though forced out by the weight. By all the other seats and the *hippodromus* there were sprays. In the largest gardens, outside Rome especially, there were aviaries, fish-ponds and game parks: peacocks and rare birds were kept. Copies of famous scenery were common, as, for example, in Hadrian's Tiburtine villa; and also prospect-towers, as were to be found in the Vandals' paradises at Carthage. The trees were fruit trees, planes, the favourite decorative tree, and evergreens, myrtles, laurels, oaks, cypress and pine. They were placed in avenues or in *quincunxes* or little groups of identical trees. Florentinus (about 200 A.D.) recommends plantations according to kind, in order to bring out the diversities. They were often clipped to strange shapes, a fashion ascribed to Gaius Matius, a knight and friend of Augustus. Box-trees were clipped into names, pyramids and cones; as were cypresses and other trees: or into imitations of animals; there were whole jungles and fleets. Dwarf-trees were also popular, and artificial graftings. The flower-beds were mostly of single species, roses, lilies, poppies (especially common), gilliflowers, hyacinths (perhaps sword lilies), anemones, Florentinus advising filling up the intervals between the straight rows of trees with roses, lilies, violets and crocuses. The ground was covered with acanthus, walls, pillars and tree-trunks overgrown with ivy and vines, trellised across and forming shaded walks.

But this artificial style was not the only one: the love of free Nature induced the laying out of parks, as the picture

discovered in 1863 shows, covering four walls of a room in a villa in Prima Porta near Rome; it dates from about the time of Augustus, and faithfully represents a garden. The foreground consists of meadows surrounded with a palisade of reeds and a stone or brick hedge. Behind the brick hedge, straight but for a few curves, there is a graceful wood growing out of a thick underwood of flowers, including palms, laurels, granates, apple-trees, quince-trees and cherry-trees. In the curves of the hedge there are, besides other undistinguishable trees, dark pine-trees, with boughs reaching down to the ground. From the background cypresses are seen towering. The whole park is full of birds; the lawn, the palisade, the flower thicket with larger birds like cocks, and the trees with various small birds. 'The whole artificial jungle has an enlivening and inspiring appearance.'

Though such designs may have been common, the imperial style of horticulture was generally the artificial and architectural, a taste inherited by the Middle Ages. The directions of Petrus de Crescentiis, who knew his ancients well, correspond absolutely. For the gardens of the middle-class, with about three to four *iugera*, he recommends straight rows of fruit-trees, or, in hot countries, cedars and palms, but only trees of the same nature, vines in between, and meadows and summer-houses. Of flowers there is no more mention than in his directions for the 'gardens of kings and great men': for which he assumes an area of twenty or more *iugera* with a stream flowing through. In those in the North a game-park should be laid out; in the South a casino (*palatium speciosum*), which will afford long shadows, and a cool breeze inside in the hottest weather, besides giving a view over the garden and its animals. There must also be a fishpond and an aviary of lattice-work, built over bushes and trees, to be stocked with pheasants, partridges, goldfinches, starlings, nightingales, ousels, and song-birds. In the garden a summerhouse with rooms and halls of trees is to be put up, in which my lord and my lady and his barons may stay in fine weather. The walls are to be rows of quick-growing fruit-trees, or willows and elms, clipped and trained to shape. Or it may be of dry wood overgrown with vines. Further, a number of graftings will afford much pleasure, but in such

a garden the evergreens, the pines, cypresses, cedars and palms are most essential. Every species is to be set separately. Finally, a direction is given to build thick living walls and pinnacles and roofs round garden and court through trees carefully clipped and trained for years. Leon Battista Alberti (1450) established the principles of the Italian garden, and bases his receipts on Pliny.

These prescriptions lasted on well into the sixteenth century. 'The later Italian horticulture does not imitate Nature, but adapts her to its own canons. The main objective is symmetry and division into characteristic spaces. The garden nearest the villa itself is to be surrounded with balustraded terraces and steps, and is rendered architectural by a semicircular ending, by gradation, grottoes and fountains. Valleys and declivities are artificially produced by interruptions, and the straight canals broadened out into basins and collected in cascades, which are to fall through statuary. Or a lower piece of ground is to be rounded off into a circus; or a whole valley or region planted in one single fashion, but must not be wholly rural (e.g. the pine-grove in the Villa Pamfili). Then the straight walls will have vistas of fountains and sculptures, and must be framed in or vaulted over with evergreens: in the first case, hedges of cypress and laurels, in the second oaks. The contrast of free Nature or architecture beyond the Italian garden, of distant hills or views of country and town, or the sea, is a first essential.' This style prevailed in Italy during the fifteenth and sixteenth centuries; was taken up in France, Germany and England and Holland, and ruled supreme, despite Rousseau's protest, far in the eighteenth and nineteenth even. Hegel prefers the architectural garden to the picturesque, in which he thinks the 'purposed purposelessness and forced freedom' tasteless: one can enjoy Nature rectified by man. Goethe, too, extolled the older style (1825), at any rate, in palaces. 'The spacious arbours, *berceaux*, *quinconces* at least allow of society meeting in an orderly way, whilst the English plan of freakish Nature sets them all in collision.'

The attempt to make Nature serve art has dominated the Italian garden from antiquity to the present day; a fact all the more remarkable, as Italian vegetation has been transformed since the sixteenth century by importations

from the East and America. Further, Italian landscape painting, with all the rich art of antiquity and the Renaissance, is still behind the Northern school; it must be admitted that the feeling for Nature has not changed under the Italian heaven, except as far as it has been influenced by Transalpine art.

ROMAN
LIFE AND MANNERS
UNDER THE EARLY
EMPIRE

By
LUDWIG FRIEDLÄNDER

Authorized Translation of the Seventh Enlarged
and Revised Edition of the *Sittengeschichte Roms*

by
J. H. FREESE, M.A. (CAMB.)

*The Author's Excursuses and Notes will be published
in a fourth volume*

CONTENTS

CHAP.	PAGE
I THE SPECTACLES	1-130
GENERAL CONSIDERATIONS	1-19

Spectacles a necessity in imperial Rome. *Panem et Circenses*. Imperial interest in the spectacles. The spectacles as a substitute for popular assemblies. How persons of distinction were received at them. Emperors at the spectacles; their condescension. Petitions and complaints brought forward by the people. Gibes and abuse, even of the emperors, permitted. Political demonstrations. Etiquette (especially in the matter of dress). Expenses of the games a heavy burden on the senatorial order. Number of festival days in the year. The three chief classes of spectacles. Extraordinary spectacles. Illuminations. Entertainment of the spectators. Presents and tickets distributed. Influx of foreigners. Demoralizing influence of the shows not limited to the lower classes. Public appearance of persons of distinction a symptom of demoralization. Attitude of the emperors towards it.

I THE CIRCUS	19-40
------------------------	-------

Site and dimensions of the great circus. Arrangement of the seats. Decorations. Traffic in and near the circus. The circus games. Chariot races. Chariot drivers. Compared with modern jockeys. The highest circles of society keenly interested in racing. Racehorses. 'Factions'—their personnel and colours. 'Factions' of Rome and Constantinople. Gradual development of the 'factions' at Rome. Preparations for the circus games.

CHAP.

PAGE

I

The praetorian games of the younger Symmachus. Public excitement. Superstitious ceremonies. The procession to the circus. Arrangements and number of the races. Chariots and teams. The race. The spectators. The present condition of the site of the circus.

II THE AMPHITHEATRE 40-90

1. The Gladiatorial Games 41-62

Beginnings and gradual development of the gladiatorial games. Numbers of the combatants. Increasing splendour of the shows. Extraordinary measures to stimulate public interest. The amphitheatre. The gladiators. Condemned criminals. Innocent or unjustly condemned persons compelled to fight. Prisoners of war. Slaves employed as gladiators. Freedmen. Gladiators under compulsion and volunteers. Advantages of the profession. Amateur gladiators. Commodus as a gladiator. Gladiators favourites with women and the public. Spanish *toreros* compared with gladiators. Trade in gladiators. Imperial gladiatorial schools in Rome, and outside Rome. Number of the imperial gladiators in Rome. Arrangement of the schools. Stern discipline necessary. Careful diet. Gladiatorial organizations. Instruction in fencing. Differences of rank. Devotion of gladiators to their order and loyalty to their masters. Employment of gladiators in war. Their miserable lot. Suicide and mutiny in the schools. Advertisements of the games. Free meals. Parade in the arena. The chief classes of combats. Gladiators killed or spared at the bidding of the spectators. Gladiatorial 'factions.' Combats *en masse*.

2. Animal-Baiting 62-74

The first exhibitions of animals. In the last century of the republic and in imperial times. Rare animals in Europe in the Middle Ages and in modern times. Giraffe; rhinoceros; hippopotamus, Number and variety of the

CHAP.

PAGE

I

animals. Animal hunts. Wild animals extirpated and driven out from northern Africa and Egypt; Asia still full of them. Imperial claims to elephants and lions. The imperial menageries in Rome. Animals procured from the provinces and foreign parts. Methods of hunting them. Their transport, decoration, taming and training. Animal fights in the arena. Huntsmen and hounds. Persons put to death by wild animals. Theatrical outfit of the spectacle. Executions and tortures accompanied by theatrical and pantomimic performances. Mythological animal pantomimes.

3. The Naumachiae 74-76

Naval engagements in the flooded arena of the amphitheatre. The Naumachiae of Julius Caesar, Augustus, Claudius (on the Fucine lake), Titus, Domitian, and Philip.

Summary 76-90

Views of educated Romans on the shows in the amphitheatre. Seneca alone condemns them. Reasons for the Roman opinion of them. Slavery. Force of habit. Magnificence of the spectacles. The individual lost in the crowd. Games in the amphitheatre compared with Spanish bull-fights. Gladiatorial games abolished at the beginning of the fifth century. *Venationes* still in existence in the sixth century. Spread of the games in the amphitheatre throughout the empire. The western provinces. Greece. Asia Minor and the East. Fate of the amphitheatres in the Middle Ages and modern times. The amphitheatres at Nîmes, Arles, Fréjus, Verona. The Colosseum.

III THE THEATRE 90-117

Relation of theatrical shows to other spectacles. The *Atellana*. The *Mimus*. Its indecency. The *minus* in Justinian's time according to Choricus. Allusions to events of the day (and especially to the emperors). The artistic

CHAP.		PAGE
I	drama. The <i>togata</i> and the <i>palliata</i> . Actors in the <i>palliata</i> . Tragedy. Separation of song and dance in tragedy. Dissolution of tragedy into its elements. Semi-dramatic concert performances of tragedians. The pantomime as an independent kind of art. The <i>libretti</i> of the pantomimes. The music of the pantomimes. The pantomimic dance. Robe or cloak dance. Pantomimic displays. Expressiveness of the pantomime. Its sensuous charm, indecency, and corrupting influence. Tragic and comic pantomime. Pylades and Bathyllus. Other orchestral performances. The Pyrrhic dance. The judgment of Paris as a Pyrrhic, described by Apuleius. Pantomime supreme on the stage. Dilettantism in the art of dancing. <i>Infamia</i> attaching to actors. Actors chiefly slaves or freedmen. Social position of famous actors. Honours and distinctions. Rewards. Court actors often imperial favourites. Public interest in the actors. Theatrical 'factions'. Disturbances in the theatre.	
IV	THE STADIUM	117-130
	Athletic contests in Rome before the imperial period. The Actian games at Nicopolis, and the periodical games under Augustus at Rome. Frequent repetition of athletic contests in Rome. The <i>Neronea</i> . The Capitoline <i>agon</i> . Later <i>agones</i> . Dislike of the Romans to gymnastics and athletics. Gymnastics nevertheless introduced into Rome, especially encouraged by Nero. Opposition to them. The Romans comparatively seldom took part in athletic contests. Dilettantism in athletics at Rome. Civil status of the athletes. Their guilds. Difference between the Greek and Roman views of athletics. High repute of athletes in Greece. Their privileges. Their improved position in Rome also after the third century.	
II	ROMAN LUXURY	131-230
	GENERAL REVIEW OF THE SUBJECT	131-145
	Introductory remarks. The common view	

partly based on exceptions and anomalies. Luxury of the Emperors (Caligula and Nero). Luxury of the petty German despots in the seventeenth and eighteenth centuries. Luxury of the nabobs in the later days of the republic. Their enormous incomes and expenses. Their real wealth not great in comparison. The largest individual fortunes of antiquity not equal to those of modern, and especially of most recent times. The largest individual fortunes in the Middle Ages and succeeding centuries; in the nineteenth century, in Russia and America. Ancient and modern wealth difficult to compare. Further exceptions—Apicius. The luxury of the wanton destruction of valuables. Too strict views of our three main authorities—Varro, Seneca and Pliny, e.g. on the cooling of food and drink with snow, and the use of feather cushions. Declamations against effeminacy and luxuriousness a rhetorical commonplace. A separate treatment of the varieties of luxury necessary. The period of the greatest luxury in Rome (31 B.C.—69 A.D.).

I LUXURY OF THE TABLE AND THE IMPORTATION OF FOREIGN FOODS 146-164

Moderation of southerners. Modest beginnings of luxury at table in the last century B.C. Introduction of foreign foods the result of the increase of prosperity and commerce. Evidence from the Middle Ages and modern times. Exaggerated criticisms of this luxury in antiquity. Foreign foods rare before the battle of Actium. Increase of table luxury after the peace. Costliness of great banquets only partly due to table luxury. Decoration. Flowers. Distribution and raffling of presents. High prices paid for dainties partly due to vanity and the desire for notoriety. Roman table luxury compared with that of the nineteenth century. The use of emetics after meals in a measure purely dietetic. Table luxury in the Middle Ages; in the empire of the Khalifs, in Christian Europe, in France,

II

in England, in Italy. Italian cookery in the sixteenth century. French cookery in the seventeenth and eighteenth centuries. Table luxury in the eighteenth century in Germany, in Poland, in Russia, in North America. Table luxury in the nineteenth century.

II THE IMPORTATION AND USE OF EDIBLE ANIMALS AND PLANTS 165-173

Importation of animals for food. Pliny's opinion of it. Artificial breeding of oysters. Imported birds. Importation of cultivated fruit trees and vegetables. Orientalization of vegetation and land during the republic and under the empire. Improvement, multiplication and acclimatization of fruits and vegetables. Comparison with modern horticulture. Spread of cultivated plants from Italy to the provinces. The olive and the vine.

III LUXURY OF DRESS AND ADORNMENT 173-185

Expensive materials little used in antiquity. Extravagance in dress in many respects less than in modern times. Frequent change of clothes. Extravagance in colours, especially purple. Comparison with luxury of dress in fifteenth and sixteenth centuries in Italy, Germany, England, and France; in the seventeenth, eighteenth and nineteenth centuries. The import of oriental wares into the empire small as compared with the modern standard; confined to Rome and the largest cities. Exports from China considerable after the third century. Extravagance in precious stones. Imitations. Pearls. Jewellery of the *conquistadores* and English nabobs. Extravagance in precious stones and pearls in modern times. Was luxury of dress prevalent amongst the lower classes in antiquity? Extravagance in scents.

IV LUXURY IN DWELLING-HOUSES 185-202

(a) City Palaces 185-193

Luxurious buildings only came in late. Rapid increase of them, 78-44 B.C., and again

CHAP.

PAGE

II

after 31 B.C. up to 69 A.D. Size of the palaces. Prices of houses and palaces. Luxury of artistic decoration. Incrustation of walls with coloured marble and other kinds of stones. Marble warehouse at the foot of the Aventine. Glass, gold and silver plate used in decoration. Movable soffits. So-called 'poor apartments'. Nero's Golden House. The palace of Domitian.

(b) Villas and Gardens 193-202

Increased luxury in villa-building after 31 B.C. Difficulties of site overcome. Villas built into the sea. The younger Pliny's villas. The villas at Sorrento and Tivoli described by Statius. Hadrian's villa at Tibur. The villa of the Gordians. Roman villas compared with modern *châteaux*. Venetian, French and other country seats in the eighteenth century. English country seats. The palace at Alupka. Roman building extravagance perhaps unequalled. Buildings the mania of the great and wealthy. Luxury of coloured materials not repeated later. Roman parks and gardens monotonous and smaller than those of the moderns. Roman and modern luxury in flowers compared. Flowers imported from Turkey and America. Luxury in varieties and exotic plants.

V LUXURY IN DOMESTIC ARRANGEMENTS 202-210

Character of the luxury in household arrangements in Roman antiquity. Excessive prices of luxurious furniture and utensils unusually high; the average prices much lower. Very high prices generally fancy prices. Roman luxury in domestic arrangements compared with modern, in the sixteenth to the eighteenth, and in the nineteenth century. Luxury in silver plate increased during the last centuries of the republic owing to the accumulation of the precious metals. Luxury in silver increased by the discovery of America, in Spain, England and France in the seventeenth and eighteenth, in Russia in the eighteenth, and in England and France in the

II

nineteenth century. The large silver dishes of the Romans perhaps served the purpose of an easily transportable reserve fund. Weight of silver plate. Luxury in silver in imperial times. Its spread among the middle and lower classes.

VI LUXURY IN FUNERALS 210-218

Funeral processions. Ancestral images. Extravagance in perfumes. Funeral pyres. Urns and sarcophagi. Burning and burial of objects used by the deceased. Cost of funerals. Banquets and shows at interments and funeral celebrations. Sepulchral monuments. Size of graves. Monuments in Italy and the provinces, and outside Italy. Cost of the monuments. Hadrian's mausoleum.

VII LUXURY IN SLAVES 218-221

Promoted by the large importation of slaves and the profits of slave ownership. Labour wasted by excessive subdivision, and the lack of tools and machinery. As much work as possible thrown upon slaves by their masters. 'Study slaves'. Exaggerated and ridiculous laziness. Slaves as luxuries. Dwarfs, giants and freaks.

VIII CONCLUSION 221-230

Cause of the comparatively small development of Roman luxury. The comparative smallness and poverty of the ancient world produced a low standard of luxury. The greatest luxury mainly confined to Rome. The good side of Roman luxury. Similarity and naturalness of clothing in all ranks. Combination of luxury with economy. Cheap substitutes for valuables, especially artistic. Luxury in cleanliness. Aqueducts common everywhere—in Italy, in the provinces, Antioch, Alexandria, African and Gallic towns. Baths. Enjoyment of nature. The lower classes share the wealth of the rich. Frequent donations for good objects, amusements and festivities. The luxury of the governments and communes democratic.

CHAP.		PAGE
III	THE ARTS	231-365
I	ARCHITECTURE, SCULPTURE AND PAINTING.	231-337
	1. Aims and Application of Architecture.	231-260
	Number and magnificence of the remains. Culture and prosperity of the old world in the early empire. Number and beauty of the towns. Camp towns. Lambaesis. Carnun- tum. Mainz. Aristides on the number and beauty of the towns. Towns in upper, central and lower Italy. Sicily. Gaul. Narbonensis. Lugdunensis. Aquitania. Belgica. Spain. Africa. Egypt. Syria. Phoenicia. Palestine. The Hauran. Arabia. Asia. Bithynia. Cappa- docia. Pamphylia and Pisidia. Lycia. Thrace. Macedonia. Dalmatia. Greece. Britain. <i>Agri decumates</i> . Raetia and Vindelicia. Noricum. Pannonia. Moesia. Dacia. Large numbers of architects in all the provinces. Buildings of the communes. Imitation of Rome. Buildings of Bithynian towns. The bridge at Alcantara. Income of the communes for de- fraying building expenses. Public buildings erected by private individuals. Buildings of the Greek sophists. Herodes Atticus. Build- ings of senators, imperial freedmen, foreign princes. Herod of Judaea. Buildings of the emperors. Imperial assistance in cases of fire and earthquake. Buildings of the Julian and Flavian emperors, of Trajan, of Hadrian (especially in Greece), of the Antonines. Private buildings in the provinces.	
	2. Aims and Application of the Plastic Arts and Painting	260-337
	(a) Decorative Art.	260-271

Dependence of the plastic arts on architec-
ture. Artistic decoration of public buildings
and places in the towns of Greece and Italy.
Statues of kings and generals. Other statues
in the *fora*. Statues of the *genti* of the cities.
Artistic decoration of private buildings, parks
and gardens in the later republic and under
the empire. Excavations of villas. Hadrian's
villa at Tivoli. General artistic decoration and

universality of the art. Abundant employment of cheap materials. Plastic in soft materials. Stucco painting. Artistic decoration general down to the last days of antiquity. Artistic adornment of furniture. Works of art as presents at the *Saturnalia* and on other occasions. Artistic adornment of sepulchral monuments.

(b) Monumental Art . . . 271-298

Personal memorials. Age of the statues of honour at Rome. Pictures of historical events. Pictures for special occasions. Pictures for triumphal processions, imperial pyres, judicial proceedings. Pictures for the shipwrecked. Votive pictures. Other representations of personal events. Representations of dream-visions. Pictures as permanent records. Portrait painting. Portraits of the emperors. Portraits of Oriental princesses as prospective brides. Portraits of private persons. Portraits in books and libraries. Portrait painting very common. Plastic representations of persons. Busts and statues of the emperor very general; their cult. Destruction of the memorials of hated emperors (especially Domitian). Preservation of imperial memorials, chiefly by consecration. Rapid erection of imperial monuments throughout the empire. Erected by officials, provincial corporations, communes and private individuals. Statues of Hadrian in Greece, of Augustus in Rome. Busts of Napoleon I. Imperial likenesses rarely old ones altered or renamed. Memorials of members of the imperial household, of the highest officials, of provincial governors, of distinguished Romans in the provinces, of subordinate officials. The honour of a statue in the *municipia*. Statues of provincial priests. Reasons for the erection of statues. Several statues of the same person, erected by *curiae*, *vici*, *pagi* and *phylae*. Erected at the cost of those honoured with them. Statues of foreigners. Statues voted by the town councils, in Rome by the Senate.

Publicly erected statues of the dead and living. Where they were set up in Rome. Statues of the chief Vestals. Private monuments ; why erected. Erection of one's own statue. Private monuments for the dead, especially as sepulchral memorials. Statues of famous men of antiquity. Personal memorials erected till the last days of antiquity.

(c) Religious Art 298-301

The large number of images of the gods the result of the theocracy. Settlements of artists near large temples. Increased artistic requirements and production *en masse* throughout the empire. Herculaneum and Pompeii show the average standard of artistic adornment in the towns of Italy. Statistics of the artistic adornment of Rome.

(d) Artistic Industry 301-320

Similarity of art and artistic industry throughout the empire except in Gaul, Egypt and Palestine. Works of art executed in Rome for the provinces, and in the quarries. The stone quarries of Pannonia. Images kept in stock. Images of the gods. Sarcophagi. Statues of honour. Made on the spot where they were to be used, partly by wandering, partly by resident artists. General uniformity of treatment, even of technique. Adherence to tradition. Bronzes in the villa of the Epicurean philosopher at Herculaneum. Rome the model for the whole empire. Production in the main reproduction, as also in plastic. Copies of famous older works in painting and mosaic, vessels, gems, pottery. High development of artistic handicraft. Influence of the discoveries at Herculaneum on the art industry of Paris. Art a manufacturing industry. Highly specialized division of labour. Co-operation of several artists. Works of art in great part executed by slaves. Cheapness of ordinary artistic work. Artists' fees under the empire ; in the eighteenth and nineteenth centuries.

(e) The Artists	320-325
---------------------------	---------

Reasons for the disparagement of artists amongst the Romans. The plastic art in the hands of the Greeks; painting also practised by the Romans. Female painters. Female models. Architecture highly valued by the Romans. Roman architects numerous.

(f) Artistic Feeling	325-337
--------------------------------	---------

Reasons for the disparagement of art amongst the Romans. Spread of artistic knowledge and interest. Recognition by the Romans of the importance of art. Dilettantism in sculpture and painting. Inspection of works of art during travels. Art collections, chiefly due to the love of show, consisted mainly of older works. Collectors often taken in by copies. Works of art which had belonged to famous persons especially prized. Collectors' pretensions to expert knowledge. Lack of true artistic feeling. Roman literature shows no trace of artistic interest or intelligence, Greek much evidence of both. Contemporary art treated with little consideration in both literatures.

II Music	337-365
--------------------	---------

Roman music early supplanted by Greek. Ancient music closely connected with poetry, as in the Middle Ages. Melody subordinated to text in vocal music. No harmony in vocal music. Instrumental music. The flute. Stringed instruments. The *cithara*. Instruments played together. Poverty of instrumental music. Comparison with modern instrumental music. Programme music. Strengthening and admixture of musical means and effects. Combination *en masse* of similar and different instruments. Influence of non-Greek, especially Alexandrian, music. The orchestra in the pantomime. Continuance of the concerto of several instruments in Rome. *Monstra* concerts. Decay and degeneration of music. Thibaut's lamentations anticipated. Music degraded to gratify the senses. Music com-

CHAP.
III

mon at table. No difference between sacred and secular music. Musical interest stimulated by the publicity of the performances. Performances of the *citharoedí* and other artists. Musical contests (especially the Capitoline). Musicians (who were often composers). Musical *virtuosi*. Their wandering life and incomes. Admiration for them. Artistic vanity, caprice and jealousy. The attitude of artists towards the public. Paid applause. Musical dilettantism. Instruction in music. Public performances of boys' and girls' choirs. Male and female, and imperial amateurs. Nero's efforts to become a professional. Music in the last days of antiquity. Music in Christian religious services. Ambrose. Greek 'modes' handed down in unbroken tradition.

CHAPTER I

THE SPECTACLES

GENERAL CONSIDERATIONS

EVERY attempted delineation of the manners and customs of Imperial Rome must necessarily include a survey, as exhaustive as may be, of the spectacles, as the best measure of her grandeur, and as indicative in many ways of her moral and intellectual condition.

Originally, for the most part, religious celebrations, they became, even in the later Republic, the best means of purchasing popular favour, and, under the Empire, of keeping the populace contented. Augustus, the tale runs, once reproached Pylades the Pantomime for his jealousy of a rival, and Pylades replied : ' It is to your advantage, Caesar, that the people concerns itself about us '. But these spectacles effected more even than the diversion of popular interest ; their magnificence was a gauge of the popularity of the sovereign. The emperors, like Louis XIV, knew how admiration aids absolute autocracy ; like Napoleon, that the imagination of the people must be excited : splendid festivals were one of their most indispensable and most constant devices. Even Caligula, according to Josephus, was honoured and beloved by the folly of the populace ; the women and the youth did not desire his death ; distributions of meat, the games and the gladiatorial combats had won their hearts, for such were the delights of the mob : the lavishing of these gifts was nominally due to consideration for the populace, though the gladiatorial combats were only intended to sate the monarch's lust of blood. The memory of Nero survived him : the people did not believe in his death, hoped and wished for his return for thirty years, and thus caused several pseudo Neros to appear ; Dio of Prusa explains this by Nero's

extravagant generosity, most manifested in his spectacles. After his murder, Tacitus describes the populace of Rome, accustomed to the theatre and the circus, as depressed and greedy for rumours. Otho, at the games, was greeted as Nero, and did not decline the title, as it ensured popularity.

But soon the omnipotent ruler could no longer give spectacles at his pleasure; they had become an unavoidable necessity. Into the capital there poured a proletariat, more corrupt and wilder and rougher than in modern capitals, composed of the dregs of every nation; its predominance was absolute, and the more dangerous as the mob consisted mostly of idlers. The Government provided for their maintenance by the great distributions of corn; and having fed them, had to supply the needs of their leisure. In a school essay, written about A.D. 100, and purporting to be a letter from Sallust to Caesar on the reorganization of the State, the ruler is advised to keep the mob occupied, after bribing them with gifts and corn, and thus to prevent them injuring the common weal. This occupation was provided by the games. The well-known words of Juvenal, *panem et circenses*, in which he sums up the desires of the people, formerly the bestower of sovereignty, the *fascēs*, the legions and everything, are simply borrowed from an older and equally expressive phrase. Pressure had been first applied at Alexandria; where if the population had plenty of bread and races nobody would trouble about anything else. Bread and races in Rome were soon regarded as no mere imperial indulgence, but as an absolute right; a *damnosa hereditas*, which had to be accepted by every new government; the best and the worst emperors alike had to vie in the splendour and magnificence of the festivals.

Augustus 'outdid every one in the frequency, variety and splendour of his spectacles': the importance which the founder of the Empire ascribed to the games is evidenced by the detailed account of them in his record of his life, and in the circumstantial directions with regard to them. The economical Vespasian built the largest amphitheatre in the world: and in 1756 the value of the travertine still left in the Colosseum was estimated by experts, according to the prices then obtaining, at 2,218,065 *scudi*, or 16,894,851 francs, the cost of the walls being put by an Italian architect at five million *scudi*.

Certainly, the material for the most part may have been provided by the demolition of the Golden House. Yet Vespasian expended hugely on spectacles, and Titus probably outbid him. Trajan was perhaps the most zealous in this respect. 'It is a sign of great statesmanship', says a later writer, 'that Trajan provided for dancers and other artists of the stage, the circus and the arena, for he knew that the Roman people loved most of all two things, bread and games: that the goodness of government is shown both in its earnest aspects and its amusements: and that whilst neglect of serious business was harmful, neglect of amusements caused discontent; even distributions of money were less desired than games; further, largesses of corn and money pacified only a few or even individuals only, but games the whole people'. Even the Stoic Marcus Aurelius prevailed on himself to give splendid spectacles, and decreed that the richest senators should provide them in his stead during his absence. Severus even, next to Hadrian the most avaricious of the Emperors, yet thought fit to devote enormous sums to the games. Tiberius is the only exception; he showed his profound contempt for the mob by giving no spectacles. Others were satisfied with lowering the actors' fees, fixing a maximum number of duellists in the gladiatorial combats, and thus cutting down expenses; such Emperors were Tiberius, and Augustus. Nerva also abolished several spectacles in the circus; Antoninus Pius and Marcus Aurelius limited the gladiatorial games and the gifts to the actors. The repetition of these ordinances proves their futility.

A further importance attached to the games under the Empire; the people were there enabled to assemble in mass, and, in the Emperor's presence, to make known their attitude, inclinations, wishes and complaints; these manifestations were tolerated to a degree found nowhere else. According to Tacitus, in the circus and the theatre the people showed the least restraint; in the utter lack of other occasions for public meetings and proclamations, the games gained additional significance.

No less important was the reception given to the Emperor and the other persons highly placed. In Republican times, statesmen valued the enthusiasm of the theatre; Cicero was rejoiced to receive 'wonderful cheers without any hostile

cat-calls' at the games. Exceptionally, poets were thus honoured : Virgil was greeted with the same respect as Augustus, on one occasion when verses of his were recited in the theatre. Under the emperors, such greetings were, as a rule, reserved for the Imperial family, the great officers of State and the provider of the entertainment. The assembled people, as these dignitaries entered, rose from their seats and applauded : Augustus even had to express disapproval of his grandchildren being thus honoured, whilst mere boys : handkerchiefs were waved (Aurelian distributed them for the purpose) ; titles and congratulations were shouted out, partly stereotyped and often repeated, and even set to music and song.

The games afforded the emperors an opportunity of coming into personal contact and ingratiating themselves with the assembled people. The more they aimed at popularity, the more frequently they attended their own and others' spectacles. Tiberius even, who disliked these diversions, was often present at the games at the beginning of his reign, partly, as Dio says, to do the entertainers honour, partly to keep the populace in order and to show his sympathy with their pleasure. Augustus taught the people to regard this as a right. Suetonius says that on all such occasions he sedulously avoided giving offence by following Caesar's example of reading and answering despatches and petitions, and partly perhaps out of his own interest in spectacles (which he acknowledged), devoted his whole attention to them. Marcus Aurelius, like Caesar, used to read and give audience and sign documents in the circus, and was scoffed at for it by the people. Nero at first used to watch the games lying down, from the window of a closed box, but later from the public podium, when his short sight forced him to use a cut emerald. Domitian seems afterwards to have had the imperial box rebuilt ; for Pliny praises Trajan for discarding it in his rebuilding of his great circus : ' Your citizens can see you, as you can see them ; see you sitting publicly amongst them, not merely the imperial box '.

Historians and biographers generally mention the graciousness and condescension of the emperors to the people at the games, and their anticipation of the public desires ; very seldom the contrary. Claudius' brutish delight in the slaughter of the arena offended even Rome ; but his affability

in the Circus, and his habit of writing his answers down and sending them by hand when possible, instead of employing heralds, made him popular. When Androclus, a runaway slave, condemned to be torn to pieces by wild beasts, was recognized by a lion, from whose foot he had drawn a thorn in Africa, and spared, the event, on the personal testimony of Apio of Alexandria, was at once recorded on a tablet, which was handed all round the circus. Claudius, too, used to count the gold pieces won by the victors on his fingers, as did the spectators, used to call the people 'mylords', and exchanged vulgar jokes with them. Titus, too, used to satisfy every popular wish, take sides in the gladiatorial contests, and, like one of the people, jeer at his opponents; neither his majesty suffered, nor the impartiality of the contest. Domitian, on the other hand, was truculent; no one dared embrace the side opposed to his favourites. Trajan restored the former freedom, and was generally affable. Hadrian was stricter, and, like Domitian, ordered silence by a herald, not deigning any reply to a turbulent request. Gallienus had a wreath given to a bull-fighter, who had missed his bull ten times; the people murmured; the herald announced that to miss a bull ten times was no easy matter.

The popular requests granted by the emperors generally referred to the games. The spectators demanded a certain sort of combat, the appearance of famous gladiators, the discharge of a brave fighter, the manumission of an actor or charioteer (who were mostly slaves), the amnesty of a criminal condemned to the wild beasts. Androclus was freed at such a demand, and led his lion about with a thin cord from tavern to tavern; money was everywhere given him, and wreaths of flowers to the lion. Criminals who bravely killed their animals were sometimes pardoned and given largess at the popular request. Marcus Aurelius declared manumissions enforced on the owner by turbulence, invalid. Tiberius once granted the manumission of a slave not his own, only with his master's consent, while Hadrian refused to free a charioteer belonging to another, and circulated his refusal on a tablet. Tiberius, after being obliged to free Actius the comedian, avoided the games and their importunities.

Other petitions of the most diverse kinds were made to the emperors, and seldom rejected. Josephus regards the

certainty of such petitions being granted as one of the chief reasons why the Romans so valued the circus. But, in the Triumphal Games of A.D. 9, the knights in vain besought the repeal of the stringent marriage-law just enacted. At a great dearth in 32 for several days demands were made in the theatre, with unusual violence towards the emperor. Tiberius once set up in his palace the statue by Lysippus of the athlete with the scraper, which had been erected by Agrippa in front of his *thermae*, and, at the request of the people in the theatre, had reluctantly to restore it. Shortly before his murder, Caligula was asked in the Circus to reduce the taxes; he was enraged, and had the loudest claimants arrested and executed. Palfurius Sura had been expelled from the Senate by Domitian; he gained the oratorical prize in the Capitoline *Agon*; the assembly unanimously called for his restitution, but in vain. These calls of the people assembled at the games were the recognized expression of the popular wishes; Titus, as military praefect, to justify the execution of men he suspected, distributed men in the theatre to demand it. Under Galba the people in the Circus and the Theatre incessantly demanded the execution of Tigellinus, until the emperor settled the matter by an edict. As is well known, the anti-Christian outbreaks in the following centuries had their origin in the Circus and the amphitheatre.

But in the great spectacles not only could the popular grievances be aired, but gibes could be freely directed at private individuals or even the emperors, imprecations against the autocrats of the world. Tertullian frequently mentions such outbreaks, and asks if there be anything harsher than the Circus that spares neither citizen nor monarch. Individual complainants were hard to detect, while the multitude were emboldened by the security of numbers. Macrinus was loathed for his cruelty; like the ancient Etruscan Mezentius, he tied condemned criminals to corpses and left them thus to perish. One day his son Diadumenos, a boy beloved for his beauty, was loudly applauded in the Circus, but voices were raised, quoting Virgil: *Egregius forma juvenis . . . dignus patriis qui laetior esset imperiis, et cui pater haud Mezentius esset*. Diocletian celebrated the twentieth year of his reign in Rome on November 20, 303, but left Rome in December, because, according to a Christian writer, he could not endure the outspokenness of the Romans (no doubt in the Circus).

But Constantius II, on his visit to Rome in 357, was delighted at the popular wit in the games he gave, and found it 'neither insolent nor unfree, but strictly moderate'. In 509 Cassiodorus writes: 'The language of the merry people in the Circus is not offensive. The place excuses the transgression. Ready tolerance of their loquacity makes the emperors popular'. Popular jeers were also aimed at private persons, especially if well known and well hated, though insults of such persons, if present, were severely punished. When Sarmentus, a slave raised to knighthood, took his place on the equestrian benches, he was met with a derisory song (still extant). Claudius issued severe edicts in 47, after the insults offered in the theatre to Publius Pomponius the consular and certain noble ladies.

The Circus also served for political demonstrations. In 59 B.C. the opponents of Caesar were greeted with tremendous cheers in the Theatre and Circus, and Caesar and his party with hisses or silence; whilst Diphilus the actor was called back again and again to repeat verses reflecting adversely on Pompey. In the course of the Civil War, Laberius' line, 'Whom many fear, must fear the many', became a popular catchword in the theatre. In 45 B.C. Cicero was pleased at the good behaviour of the people in the games: the image of Caesar had been carried about in procession with the images of the gods; and her evil neighbour had prevented the goddess of victory being applauded. In 40 B.C. men were longing for the conclusion of the war against Sextus Pompeius, and a statue of his patron god Neptune was warmly greeted; there was a riot the third day, when it was not brought out. The downfall of Commodus' mighty chamberlain Cleander was prefaced by an organized demonstration in the Circus. A company of boys, led by a tall, hideously ugly woman burst into the arena during a pause and imprecated Cleander the people joined in, and rushed excitedly to the imperial villa, where they enforced the surrender of the hated favourite. Under Commodus, too, Pertinax, the future emperor, rose to prominence, and, when a horse of the name belonging to Commodus' green faction won, the Greens cried out: 'It is Pertinax'; and the Blues answered: 'If it only were!' Such popular outbreaks occurred, sometimes undesigned, sometimes in consequence of the strange forces that provoke great masses of men to speak or act unanimously. Cassius

Dio says he himself heard, in 196, during the civil war between the pretender Albinus and Severus, a countless multitude in the Circus with wonderful unanimity utter complaints at the continuance of the war and their desire of peace; he regarded it as 'a divine inspiration: how otherwise could so many myriads have begun at the same moment, calling out for the same thing, like a well-trained chorus, and without any hitch, as at rehearsals?' Plautianus, the powerful favourite of Severus, was greeted in the Circus, shortly before his downfall in 205, with the jeer that he was wealthier than the three others' (Severus and his two sons). Caracalla drained the Empire's life blood, and was told, 'We will kill the living, to bury the dead'. The number of such incidents that Dio records proves their frequency. The topical references in the theatrical performances will be dealt with later.

The presence of the emperors and other great personages obliged spectators to take many irksome precautions. Augustus saw one knight drinking and had him informed that he breakfasted at home. The knight rejoined: 'Yes, you have your seat reserved'. The early monarchy issued express ordinances on the dress of the spectators, varied under various rulers. Roman citizens had to wear the *toga*, a heavy costume, in the hot summer, which spoiled the pleasure of the entertainment. 'Whilst Rome is at the Circus', Juvenal writes in his sixtieth year, 'my shrunken skin can absorb the rays of the April sun, and be spared the *toga*'. Augustus, ever anxious to restore ancient custom, ordered the aediles to refuse admission except to those wearing the *toga*. Knights and senators had to don their robes, and officiate in their official garb, which was only discarded at the public mourning for a deceased emperor. Commodus at a gladiatorial show given shortly before his death required spectators to wear the dark close-buttoned rain-cloak, (which was also worn by mourners,) and this was taken as a premonition of his death. In the summer Augustus gave, and Tiberius repealed, leave to come to the Circus barefoot: Caligula reintroduced the custom, and in 37 for the first time allowed the senators to use the Thessalian parasol hats: until then they had had to remain bareheaded. At one spectacle of Domitian, a rain-storm came on, and no one was allowed to go or change, whilst the emperor put on cloak after cloak: many fell ill and died. Domitian

strictly insisted on these regulations and revived others that had fallen into disuse. The indulgence of coloured dress was revoked by him, except for white, scarlet and purple. Besides parasol hats, sunshades were allowed. The enforcement of law and order at the spectacles was in the province of the City Praefect, who could have the assistance of the military, and could forbid entrance to offenders and seditious folk. Even in the early Republic we should consider the sums expended on popular pleasures large. After 364 B.C. the Roman Games were held for four days in September and theatrical pieces were performed; 200,000 *asses* (£2,145) were allowed on their account, and this sum was not increased until the second Punic War. The other State Games were also paid out of the *aerarium*. But with the increased demands, the state-grant became insufficient, and the givers of the spectacles, the aediles, had to contribute from their own pockets, borrow from their friends, or extort the money from the *socii* or the provincials; often the effort rendered them insolvent. About 150 B.C. great gladiatorial games cost over 30 talents (£7,050). Yet even this was little in comparison with the gigantic squanderings on games in the later Republic; some, such as the games of Scaurus (58), Pompey (55), Caesar, can only have been exceeded by the emperors; Milo in 53 spent, on his candidature for the consulate, 'three inheritances, to stop the mouth of the populace'. Cicero, writing to his brother Quintus, calls these games the most extravagant ever given; Milo, he says, must be mad. Yet, later, these spectacles are not specially distinguished. Under the Empire larger sums were allowed for the State Games (which were lengthened). According to a document of 51 A.D., 760,000 sesterces (£8,250) were spent on the Roman Games, 600,000 (£6,025) on the Plebeian, 380,000 (£4,125) on the Apollinarian, and 10,000 (£108 3s.) on the newly-instituted Augustal games. These sums do not include the contributions of officials, or the enormous sums spent by private individuals, as to which our information is only fragmentary. When Herod of Judaea instituted quadrennial games in honour of Augustus, Augustus and Livia gave him all the essential properties: this was reckoned at 500 talents (£117,900). In the early empire a good three days' exhibition of gladiators in a city of Campania cost 400,000 sesterces (£4,350). Generally, however, expenses in the *municipia* would be less.

The city of Pisaurum (Pesaro) received a legacy of 600,000 sesterces to provide for a quinquennial gladiatorial exhibition. The *senatus consultum* of 27 A.D., forbidding any one with less than 400,000 sesterces from giving gladiatorial shows, must clearly have been directed against penniless speculators; for even in the *municipia* a larger expenditure would be requisite. At the Feast of the Great Mother (April 4-10) the praetor, under Domitian, had to contribute 100,000 out of his own monies (£1,087 10s.), and, even then, underpaid the performers, the charioteers especially. Generally the praetor could not meet the expense, the chariot races alone costing 400,000 sesterces. Hadrian received 2,000,000 (£21,771) from Trajan for the games during his praetorship in 107. The seven days' games given by Symmachus on his son's praetorship cost 2,000 pounds of gold (about £91,350), and he was by no means the richest of the senators; another senator of that time, Maximus, spent double as much. The expenses of the consulate in games used then to cost over 2,000 pounds of gold; the emperor had to give the lion's share. Justinian became Consul in 521 and outbid the record of eastern magnificence in largess and spectacles, spending 288,000 *solidi* (about £181,500). In Marcus Aurelius' time, the total expenses on gladiators in the Empire, excluding Rome, were estimated at over £500,000 a year. A speech before the senate at about this epoch states that the decrees limiting this extravagance did save the *municipia* from insolvency, as well as the prominent men who gave the games; they were the priests belonging to the provincial aristocracy and the city officials; the law obliged the priests to provide the games, custom and their fellow citizens' expectations the others.

In Rome this oppressive obligation fell almost entirely on the senators, who were only partially relieved from the fisc. For centuries the Roman aristocracy was thus taxed almost to the point of exhaustion in favour of the proletariat. The order purchased rank, titles and tinsel dignities at the expense of outlay that ruined many old families, or necessitated the support of their colleagues and the emperor. In the first centuries the brilliancy of the senatorial offices compensated the onerous charges, and comparatively few evaded the burden. But, as time went on, and senators came to mean

only providers of public festivals, losing all power whatsoever, more and more abstained : at last competitors for curule honours began to fall short. Constantine had to coerce candidates, who sought to avoid the praetorship by flight ; he may not have been the first emperor obliged to take such measures. A series of edicts in the fourth century regulated the elections to the praetorship and quaestorship in Rome and Constantinople for periods of ten years, out of all the senators who had attained their twenty-ninth year ; and specified valid exemptions. Sums were fixed as *minima* for the games for the various praetorships. Any who evaded the obligation on insufficient grounds had to bear the whole expense of the games, which the fisc gave in their names, and had, further, as a fine, to provide a considerable amount of corn to the granaries of the capital. The obligation was made a charge on the heirs of praetors elect, who had died before taking office.

The number of festival days in the year devoted to the Games cannot be ascertained for any epoch, as the regular spectacles were constantly shifted, and the extraordinary ones incalculable. The calendars of the Empire only give an approximate picture of the annual games. During the Republic there were seven, which under Augustus lasted sixty-six days : the Roman Games taking up fifteen, after Caesar's death sixteen (September 4-19), the Plebeian fourteen (November 4-17), those of Ceres eight (April 12-19), those of Apollo eight (July 6-13), those of the Great Mother eight (April 3-10) and of Flora six (April 28-May 3), and the Sullan Commemoration seven (October 26-November 1). Out of these sixty-six days, fourteen were given up to races, two to trials of racing horses, two to sacrifices, and forty-eight to theatricals ; gladiators did not usually appear in public games during the Republic. All these festivals, excepting the last, subsisted in some measure down to the fourth century.

After the fall of the Republic few games were added. Up to 4 B.C. the only addition was the eleven day games of Venus Genetrix (July 20-30, with four *circenses dies*), and the *ludus circensis Martis* on May 12 ; Augustus added a second *ludus circensis Martis* on August 1, and Tiberius the eight day festival in honour of Augustus, afterwards prolonged to ten days (October 3-12). Later on, the number of festival days with games, under Tiberius 87 in number, was very variously

increased by triumphs, dedications, imperial birthdays and so on; and the reductions effected by Nerva, Severus and Macrinus, scarcely affected the constant growth. Marcus Aurelius increased the judicial days to 230; then 135 at most must have been given to exhibitions. In the middle of the fourth century there were 175 holidays, ten with gladiatorial exhibitions, 64 in the circus and 101 in the theatre. The gladiatorial combats and wild beast hunts do not appear in the early calendars, and are limited to ten days in December in the fourth century; they must, however, have been very frequent, to judge from the evidence of literature and inscriptions. Alexander Severus designed distributing the gladiatorial combats over the whole year, giving one a month, but, for some reason, did not carry his intention out. Extraordinary spectacles were also tolerably numerous, and sometimes lasted for weeks or months. At the dedication of the Flavian amphitheatre in 80 Titus gave a 100 day festival, and, on his second Dacian triumph in 106, Trajan gave a 123 day festival. All the greater spectacles began at sunrise (the seats were filled before dawn) and lasted until sundown. Celsus (under Tiberius) speaks of attending the spectacles all day long. St. Augustine says that theatricals and circus games were sometimes given on the same day.

Originally the games in the Circus were the most important, and concluded the festivals. In the later Republic the gorgeous and extravagant combats of gladiators were the popular favourites. In three places, says Cicero in 56 B.C., is the voice of the Roman people most certainly heard: in city assemblies, the *comitia*, and at the games and combats; at the last people of all classes gathered in the greatest numbers for its principal pleasure. But, when in the early Empire the Circus parties were organized, betting interests set all others in the background. Theatricals, though still popular, took only the third place. Like the people, the emperors laid most weight on the two first kinds of entertainment, and spent enormous sums on them. Coins (in the lack of other documents) evidence the imperial generosity in this direction, having on the obverse buildings and games in the amphitheatre and circus, and scarcely ever theatres and dramas. At the Secular Games, for three days and nights scenic representations were given in the Campus Martius; but no indication

is given of them at the millenary celebration under Emperor Philip on the coins, on which lions, hippopotami, and wild animals recall the animal baitings.

Besides these three main varieties, even under the Republic Rome borrowed from Greece athletic combats and musical performances, partly for certain periodic festivals, to be mentioned afterwards, and partly as incidental. At the greater festivals relief was afforded by having fireworks, rope dancers, jugglers, acrobats. Varro in his book on the theatre already mentions boys turning somersaults. Pliny saw a strong man called Athanatos walk across the stage with armour and shoes weighing altogether 1,000 Roman pounds. Carinus and Numerianus gave an unprecedented exhibition. The reproduction of the features of it in the colonnade of a stable in the Palatium is an illustration of the variety of these side-shows. A rope dancer is seen dancing with buskins on thin, almost invisible ropes : a wall-climber clambering up a wall to escape a bear he had teased : bears acting a piece, and a hundred trumpeters in chorus, and a hundred players of flutes and wind instruments, and a thousand athletes and pantomimes. The stage was provided with transformation scenery and fireworks ; and these are only samples. Claudian the poet celebrated an exhibition given by the consul Flavius Mallius Theodorus, in which there were chariot races, athletic contests, animal baitings, theatricals, and music, besides several kinds of jugglers who flew like birds, formed pyramids, with a boy on the top, not to speak of transformation scenes, pyrotechnics with harmless flames, and boat-races. Manilius' frequent mentions of acrobats are reminiscences of spectacles. He specifies rope dancers and jugglers one of whom hovered in mid-air whilst the other jumped to the ground from a scaffolding, leaping through fire, soaring like dolphins in space, unfeathered birds.

Splendid illumination was an important part of the spectacles, as usually in ancient celebrations, religious or festive. In ancient days the *forum* and *comitium* were decked at night with lamps at the games. The continuance of the festivals by artificial light was a late innovation, beginning, possibly, in the Feast of Flora, the rites of which were best suited to night-time. In 32 A.D. Lucius Sejanus, as praetor, had the spectators of the *Floralia* conducted home by 5,000 slave

torch-bearers. The Secular Games of Augustus of 17 B.C. also lasted all night according to ancient custom, and young men and women were forbidden to attend them, unless in the company of their elders. At the millenary celebrations of 248 A.D., according to the chroniclers, the people did not go to bed for three nights. Thus illuminations at the Saturnalia were usual: it was the festival of the turn of the year, held about the time of the shortest day, like Christmas. At the festival on December 1, 88, given by Domitian as a preliminary to the Saturnalia, a circle of lights was lowered down into the amphitheatre at dusk, turning night into day. Nero's quinquennial feast (instituted in 60) seems to have lasted the night through: objections on the score of possible immorality were met with the reply that the light would be too bright. In Imperial Rome night celebrations must have been common, as 'spectacles and illuminations' are associated in many Italian city records; in a legacy found on the island of Ebusus (Iviça) directions are given for the holding of spectacles with pitch-lights on a certain day. Caligula once gave theatrical performances at night; the whole city was lit up as well. The chariot-race in Nero's gardens with Christians in pitch as torches, was also a night spectacle. Domitian held gladiatorial games and wild beast shows by artificial light, and Martial's reference to the night wave from which Leander escaped, indicates a performance of Hero and Leander at night.

During the Republic, even as under the Empire, the spectators received hospitality and largess at the spectacles. The games lasted all day: about midday there was a pause and the onlookers scattered for lunch, or had it supplied in the theatre or circus by slaves staggering under huge baskets of food and wine; permits for food and drink were also handed round, and complaints would be raised of gluttony or cheating. At the greater games, which lasted several days, whole days would be reserved for general feasts. The distributions taking place at the Games of the two City Praefects were abolished in 217 A.D., excepting those at the Floralia. At the Floralia a generous allowance of a mash of peas and beans pacified the people; at imperial games their taste was more delicate. At the December 1 festival in 88, according to Statius, the young and beautiful imperial servants, in rich costume,

waiting everywhere on the audience, fully equalled the spectators in number. Some brought costly dishes in baskets, and white napkins, and others, old wine. Children, women, plebs, knights and senate and the emperor himself all dined at one board ; and the poorest man could boast himself the emperor's guest. At such a festival Caligula, seeing a Roman knight and a senator looking particularly delighted, sent the knight his own portion and made the senator a praetor *extra ordinem*.

Sometimes, too, presents, especially of fruit and eatables, were thrown down to the audience ; at the festival in December, 88, it rained figs, dates, nuts, plums, cakes, cheese and pastry in the morning, and in the evening, birds, pheasants, and Numidian partridges. Often, too, tickets were showered down, entitling the receiver to the most diverse, and often valuable prizes : some examples are extant. Domitian once, when most of the tickets had on the first day fallen among the third order, directed fifty each to be thrown among the knights and senators. At a very long and magnificent festival, founded by Nero for the eternity of the Roman Empire, every day thousands of different birds were thrown down, and tickets entitling the holders to furniture, corn, clothing, gold, silver, jewellery, pearls, pictures, paintings, draught animals, tamed beasts and ships, lodging-houses and country estates. Titus used similar tickets at the dedication of the Flavian Amphitheatre. At one feast of Elagabalus, a ticket might win its holder ten bears, ten dormice, ten lettuces, ten pounds of gold ; but swine never, as the Emperor's religion forbade his eating them. On such occasions there was much disorder, rough play or even loss of life. The wise left before this scene came on, knowing that trifles were bought there too dear. Speculators, too, would buy anything a scambler might get, beforehand. In the later Empire many hundreds of animals of the chase, native or foreign, were sometimes given to the people. The first mention of this practice is in a festival, given by Gordian as aedile, and most of all at the games at Probus' triumph over the Germans and Blemmyes. The Circus was transformed into a forest by trees planted and fastened in. A thousand ostriches, stags, boars, wild sheep, antelopes and other antlered animals were driven in, and beasts of every description : then the people were

admitted and every one was allowed to seize and keep what he could.

At the great festivals not only Romans but strangers assembled in large numbers. In Republican times the *municipia* flocked to share in Rome's games, and, when Rome became the centre of the world, the curious of all nations. At Julius Caesar's triumphal games, the influx was so great that most had to stay in shanties and tents in the streets, and many, including two senators, were crushed to death. For his great spectacles Augustus had the city patrolled to prevent burglaries in the deserted streets; at his presentation of a naval fight, as Ovid says, men and women from East and West flocked together, and the world came to Rome. In Martial's description of the spectacles at the dedication of the Flavian Amphitheatre, no people, however barbarous or foreign, failed to send its contingent. The farmer from the foot of the Balkan, the Sarmatian who fed on mare's milk, the dwellers at the sources of the Nile, the inhabitants of the ocean-marge, Sabaeans, Arabians, Sicambrians, with their hair knotted on their heads, and curly-haired negroes; the motley languages united in one common acclamation to the emperor as *pater patriae*. Dio says that the lightning which at the Volcanalia 217 (August 23) destroyed the amphitheatre, smote, not only Rome, but all the world which used to frequent it.

These facts illustrate the huge attempts to entertain the Roman people. The Roman populace was indeed accustomed to greatness, as none other. It had seen, century after century, its Circus filled with triumphal processions of conquered kings of distant lands, and the treasures of the earth heaped up for Rome. They, the heirs of this great past, still commanded the world: things marvellous and incredible they daily heard, and Rome the eternal, the wonder of antiquity and modernity, was ever before their eyes. But the spectacles did not occupy only the masses, for whom they were intended. The impression of these exciting scenes of night fascinated all, infected the intellect of Rome, even the highest and most cultured circles, and especially the women. How the games pervaded every man's thought, the proverbs show. When they drew breath, they breathed in the passion for the circus, the stage and the arena, 'an original evil

begotten in the womb'. But, certain as are the evil moral effects of the games even on the upper classes, the demonstration of it in detail is impossible.

One sign of this decadence, sufficient in itself to show the prevalence of these degrading influences, must be mentioned : the public appearance of men, and even women of noble family on the stage, in the arena, and in the racecourse. Various motives concurred to produce this unprecedented contravention of law and morality—the decay and poverty of a part of the nobility, the compulsion of the emperors ; but this is not cause enough. The presence of the emperors at the spectacles sufficiently proves the aristocratic mania for them, uncurbed by law or custom. Many emperors not only aimed at proficiency in acting, dancing, music, chariot-driving, gladiatorship, but exhibited their prowess before companies of varying size. Nero traversed Greece as a professional artist ; Commodus left the palace to live in the gladiators' school ; Caracalla in a blue livery publicly drove his chariot ; it must have been an infatuation that compelled men of noble birth to this degradation.

Even under Augustus a wastrel's last refuge was the school of gladiators ; but this last dishonour was rare, and amongst the senators rarer than amongst the knights, and the emperors seldom directly or indirectly forced knights or senators to appear in public. Apart from the wish of some few to diminish the offensiveness of their own appearance in the arena by a general imitation, Caesarism, with its hatred of aristocracy, its class-levelling, and favouring of the populace, would not regret the degradation of the upper classes ; and the mob would be delighted at seeing the noblest of the State exhibit themselves like slaves and hirelings, to provide a holiday.

But most of the Emperors had no such thoughts, or restrained them out of respect to custom, law or their own intimacies. The first Caesar did indeed show his autocratic disrespect for rank. In his Circus games young nobles raced, and Laberius the knight was bribed and forced on to the stage, and others into the arena. But soon after his death (38 B.C.) senators were forbidden to appear in the arena ; and some time after 16 B.C. there followed a *senatus consultum* prohibiting senators and knights from the stage as well. Suetonius

says Augustus did employ knights and senators in both capacities, but only before this decree. In the spectacles given by Augustus in 29 B.C. at the dedication of the Temple of Caesar, patricians and knights ran horse and chariot races, and a senator, Quintus Vintelius, appeared as a gladiator. Nero's grandfather, Lucius Domitius Ahenobarbus, during his praetorship and consulate 16 B.C. had a mime acted by knights and married women. In 10 A.D. knights were expressly allowed to appear as gladiators. Tiberius, a thorough aristocrat, had more contempt for the mob than hatred of the aristocracy, and would not degrade the upper classes; he sternly enforced the *senatus consultum*, and punished the decadent youth of both orders who evaded it by getting themselves convicted of some dishonourable act. In 15 A.D., at one of Drusus' spectacles, two knights fought. Tiberius was present, and, after one had fallen, forbade the other continuing. In Caligula's spectacles, senators drove chariots, and, as a punishment for alleged public appearances in the arena or on the stage, many knights and senators were put to death or forced to fight as gladiators. Claudius apparently not only had the intention of stopping the abuse, but succeeded. Under Nero, however, the first emperor to act in public, the passion reached its highest point: rank, sex, wealth, reputation, all availed nothing against the imperial whim to drive them to the degradation of the stage or the arena. Vitellius issued a sharp edict against this degradation of the knighthood; and Domitian made some ostentation of anxiety for the honour of rank; he expelled a man of quaestorian rank from the Senate, Caecilius Rufinus, for his love of dancing. In 91 Acilius Glabrio had to fight a lion at the Alban villa, or, according to another account, volunteered there to fight a bear; one ground for his execution in 95 was this combat. Up to Commodus, the succeeding emperors did not force senators or knights to appear in public. Yet a man of ill fame in the Senate could tell Marcus Aurelius he saw about him many praetors who had fought with him in the arena; and Severus could answer the Senate's complaints at Commodus' appearing in the amphitheatre, by asking whether none of the senators had fought as gladiators; else why should certain of them have bought Commodus' shields and golden helmets? 'When the fore-

head is scarred enough with the mask, it is used for the helmet', says Seneca. 'Under an emperor who plays the cithara in public, a noble comedian may be expected', says Juvenal. 'The next stage is the gladiators' school'.

Thus, excepting for Nero, the emperors are not most to blame for this degradation of senators and knights; an unmistakable sign of the irresistible influence of these marvellous spectacles upon men's minds.

I THE CIRCUS

§ 1

Between the parallel slopes of the Aventine and Palatine there is a valley 600 metres long and 150 broad, an ideal arena for races, and chariot-races especially. During the Republic the accommodation for the races and the spectators was extremely simple. The constructions begun by Julius Caesar and completed by Augustus first made the Roman Circus one of its most splendid buildings. The seats for the spectators were separated from the course by a ditch ten feet broad, and rose in three tiers in the form of an amphitheatre. The lowest of these consisted of stone, and the two upper of wood, and wood was used up to late times, as collapses are often mentioned, one under Antoninus Pius, in which 1,112 lives were lost, and also under Diocletian and Maximin. Under Augustus the structure was not very lofty, and there was a view on to the Circus from the upper stories of the houses around, a position Augustus liked. The first large reconstruction was undertaken by Nero after the great fire of 64 which destroyed no small part of the Circus, whence it started; he also had the moat filled in and utilized for extra seats. Another fire under Domitian occasioned a further reconstruction, which was completed by Trajan. The Circus was then further enlarged in connexion with a scheme of decoration: an inscription makes Trajan boast of having provided room enough for the whole Roman people. According to Pliny the Younger (A.D. 100) its endless length was in harmony with the gorgeousness of the temples; it was worthy of the sovereign nation, and, in itself, no less remarkable than the games exhibited in it. We have only scanty references to

later restorations and extensions. The seating accommodation at the last was from 180,000 to 190,000. The lowest seats, those nearest to the course, were assigned to the senators, the next tier to the knights and the rest to the commonalty. Women sat with the men, not apart as at the other spectacles. The emperor and his family sat amongst the senators, or built their boxes in the lowest tier.

The decorations were rich throughout. An account dating from the fourth century specifies the bronze on the rows of seats. But the principal feature was the obelisk Augustus set up in the centre (now in the Piazza del Popolo); Constantius added another larger one (now in the Piazza del Laterano). The circus was surrounded by a one-storey edifice with staircases and entrances, affording easy access and exits for thousands at once; containing in its cellars shops and conveniences, and above, the owner's residence; of three cellars two served as shops and refreshment places, and the third as the entrance. This low block of buildings was always lively, and seldom proper. In Ennius' day street-corner astrologers made the Circus their resort; hence Horace, who liked walking about amongst the augurs there in the evenings, speaks of the deceitful circus; and, in Juvenal's time, such seers gave mean folk advice, and predicted their fortunes with little stones on boards. Further, even in Cicero's day, there were cookshops in the Circus; the players, who there amused the rabble, were honoured by Augustus to the extent of performing before his guests. The great fire under Nero broke out in the part of the Circus next to Mons Caelius and the Palatine, in the shops with their inflammable wares. The name of one fruit-dealer of the Great Circus has come down to us in an inscription. But these cellars, as also those round the Theatre and the Stadium, were used as brothels: a Christian writer remarks that the road to the Circus lay through the brothel. The prostitutes included Syrians and Oriental women in foreign dress, who danced obscenely to the sound of kettle-drums, cymbals and castagnettes.

The performances, in the course of the centuries, become longer, more various and more magnificent. The main feature was, as always, the chariot-races. But there were also races on horseback, the riders, after an old Roman military custom, leaping from horse to horse, or plying arms on

horseback, picking up their prizes from the ground in full gallop, and other similar exploits. They would lie down on galloping steeds, leap over four-in-hands. Pugilists, runners, wrestlers were common in the earlier epoch, and later too in *stadia* specially constructed: thus in 44 A.D. there was an athletic contest in the Circus. An inscription found near the grove of the Arvales mentions a Green runner Fuscus, who died at the age of 24, and won 53 times at Rome, twice in the Circus of the Arvales, and once at Bovillae; one of these races he won only at the second lap: he was the best runner of his time, and, at his first appearance in 35 A.D., won the race. Pliny mentions the long runs frequent in the Circus of his day: his distances seem fabulous; one boy eight years old ran 75 *millia* from midday to evening; another 160 *millia*; an inscription of an imperial runner tells of his doing 94 *millia* on one day; as a wonderful feat Fletcher, the Englishman, is said to have done 60 miles in 14 hours, and Barclay 90 in 21½; the Peruvian messengers of the Incas ran 50 *leguas* (about 200 miles) in 24 hours.

In Republican times there used to be mock-fights in the Circus, and other military exhibitions undertaken by young citizens in full armour; divisions of troops, foot or cavalry, replaced them under the Empire. Or again the equestrian order in its six *turmae*, each led by its captain, and the whole troop commanded by the 'First of the Youth' (generally the heir to the throne) used to perform in gala-dress in the Circus. Boys of noble descent, too, used to figure before the people in the Circus in the so-called Troy-play, an old custom revived by Augustus, and much in favour with the Julian Emperors. The boys, mainly of senatorial family, and occasionally the young princes, in detachments according to age (of boys under 11, or under 17) went through cavalry exercise in glittering armour. Baitings of wild animals and gladiatorial games, generally reserved for the amphitheatre, were given, especially if on a large scale, in the Circus, perhaps invariably before the building of the Colosseum; as were the performances in which Androclus and his lion appeared.

But these circus-games, however splendid in accoutrement and dignified in the performers, never ranked as high as the chariot-races, in which the masses felt an absorbing interest in the so-called factions of the charioteers, not, like the Greeks,

in the persons of the competitors, or, like moderns, in the horses themselves. Yet the growing passion for the races led gradually to an intense interest in the horses.

In ancient times citizens with their chariots and slaves took part in the races, and the wreath of victory was considered as honourable as that of the triumphant conqueror, and, like it, laid on the funeral hearse. But it was always a loss of dignity to expose one's own person for the popular pleasure, even though the charioteer was not as contemptible as an actor or gladiator ; this arduous and dangerous occupation was therefore relegated to common folk, freedmen and slaves, the latter being sometimes rewarded with their freedom ; the prizes were palms and wreaths, money, and, later, valuable dresses. These races were promoted by the public spirit of their givers, and yet more by the competition of the factions for the best performers, who often made their fortunes. Of the charioteers known through inscriptions, only one, Scirtus, served one and the same faction (the White) for thirteen years. Another charioteer, Diocles, joined the Red faction only after trying the three others ; from inscriptions we learn that others won victories for all four, and earned some large share of the prizes. Scopus, the famous charioteer under Domitian, according to Martial, in one hour, won, for his victory, fifteen purses of gold ; Juvenal estimates the income of one Red charioteer as a hundred times as much as that of an advocate. Sometimes they had a voice in the management of the Faction. Yet, in the later Empire, their earnings increased ; but modern jockeys gain larger fees. Vopiscus says that *Furius Placidus'* consulate (? 343 A.D.) was so gorgeously celebrated that 'the charioteers received no mere rewards, but landed properties ; they wore half-silken tunics, embroidered linen, and had horses ; whereat honest people groaned'. Libanius, about this time, mentions the wealth of the charioteers in the East.

The heroes of the racecourse personally attracted much attention. On the track they were greeted with acclamation and good wishes. Much of this applause may have been purchased. St. Jerome speaks of the buying of popular favour, after the manner of charioteers. But the more famous had a really devoted number of adherents always in their train, Martial wrote two poems to Scopus, 'the lustre of the

noisy circus, the delight of Rome and the object of its applause', after his death at the age of 27. He calls on the gods of victory, favour, honour and fame to mourn him. 'Envious fate counted his wreaths of honour, and deemed him an old man. The saunterers round the Porticus of Quirinus talked first of the bettings on Scorpis and Incitatus, the runner, and, next only, of Martial's latest epigrams'. Gilded bronze busts and statues of Scorpis were in 89 A.D. plentiful in Rome, and commemorative columns for the victors of the racecourse must have become still more common. Tourists to Rome in the middle of the second century were amazed at the many statues of charioteers in racing costume; to this day the most various monuments are found, showing that every art concerned itself with the perpetuation of their fame.

Further, the doings of the most eminent charioteers would be mentioned in the official *Acta diurna* of Rome, and even formally recorded on stone, either by themselves, or their admirers. Some such records are extant. In them the winning horses, the prizes, and the distinctions (extolled as unexampled) are catalogued. An indication is given of the increasing vogue of chariot-racing in the first century. The White charioteer Scirtus, according to his inscription, won seven times with a four-in-hand, and four times, at the second race (*revocatus*), and won the second prize 29 times, and the third 60 times; this was from 13-25 A.D., a period meagre in spectacles. One hundred years later there was a class of *miliarii* amongst the charioteers, those who had won a thousand victories. Crescens, a Moor, a Blue charioteer, drove a four-in-hand at the age of thirteen, and from 115-124 ran 686 races, getting the first prize 47 times, the second 130 times, and third 111 times, winning in all 1,558,346 sesterces (about £16,950), of which he had a large share. There is a monument to Gaius Apuleius Diocles (under Antoninus Pius, after 146 A.D.), a Spanish charioteer of the Red faction; it mentions Flavius Scorpis (no doubt the Scorpis of Martial) and Pompeius Musclosus, assigning them 2,048, and 3,559 victories. Diocles' monument was set up by his admirers and party, after his retirement at the age of 42. At eighteen he began driving a four-in-hand, ran 4,257 races, winning 1,462 and 1,361 times for the Reds; in racing with one chariot (of each faction, four in all) he had won 1,064 times, with two 347

times, and with three 51 times. Out of the 1,064, some of the races had been with six or seven in hand, and 92 for prizes from 30,000 to 60,000 sesterces. His total earnings amounted to 35,863,120 sesterces (more than £375,000). He had made nine horses win a hundred races, and one two hundred; his 'insignia' consisted in beating previous records. In one year, out of 134 victories he had won 118 in the most approved fashion with one chariot to each horse, and thus had surpassed his great rival Thallus. He was the first man since the foundation of Rome to win races for 50,000 sesterces eight times with the same three horses; and had won 29 such prizes, one more than any of his predecessors. On one day he had raced twice with six-in-hands for 40,000 sesterces, winning both, an unparalleled event; he had won a race for 50,000 sesterces with seven horses not yoked together, also a record; won a race for 30,000 without a whip; had gained fame for these novelties, and so on.

These charioteers are like modern jockeys in their appeal to the sporting circles of Europe, as then to the Roman factions, and in their winning for themselves and their backers enormous sums. Fred Archer's description in a sporting paper reads very much like these monuments. He was 'The most celebrated and fortunate jockey of modern times; he had raced 570 times, won 199 times, once after a dead heat, in five races he won had passed the barrier; come in second 126 times, third 80 times and was not placed 165 times. His fees at £3 and £5 would amount to £2,108. But, with money gifts from owners, his average income was from £8,000 to £10,000. Wherever he went he had his train of bookmakers. In six years, as the head of his profession, he won 1,172 races, and at all the principal meetings. Next to Archer came Charles Wood, who raced 458 times and won 89 times. The first six French jockeys altogether have not won as much as Fred Archer'. When Archer died on November 8, 1886, at the age of twenty-nine, he had won 2,749 races, and left a large fortune.

Roman Society, even the best, took keen interest in racing, partly because of the factions, and also in consequence of the passion for chariot-driving, a feeling excusable, in the eyes of moderate men, in the young, but blameworthy in men of ripe years and high position, and in the emperors. Young noble-

men not only drove the horses in the country roads, but also put on the break themselves, filled the mangers, and swore like coachmen and muleteers by the horse-goddess Epona. Nero's father Domitius Ahenobarbus had been in his youth a famous devotee of the charioteer's art. Vitellius, who was often seen in the Blue stables currying the horses, won the favour of Caligula and Nero through his zeal for charioteering, Caligula playing at it, but Nero being an expert. Amongst Caligula's favourites was Eutychus, the charioteer of the Greens ; Caligula, after one feast, once gave him two million sesterces, and the Praetorians had to build stables for his horses. Lucius Verus, Commodus, Caracalla, Geta, and Elagabalus, were all affected with this passion. Elagabalus selected his favourites from amongst professional racers, and made the mother of Hierocles, his chief minion, a consular, and a charioteer, Gordius, Praefect of the Watch.

Circus-drivers turned their pre-eminence into an opportunity for impudence. In the early Empire, probably on certain days only, they might go about the city masked, and, as practical jokes, pilfer and cheat. Nero prohibited the custom. But nothing could restrain the licence of men who received imperial favour and were conscious of being indispensable.

The best racehorses were reared in the provinces. In Italy there were also breeding-stations, especially in the wide valleys of Apulia and Calabria. Tigellinus owned lands in these regions and bred circus-horses ; he is said to have incited Nero's passion for racing. The Hirpine horses were considered the best ; and Pliny asserts that for three-in-hands the Italian sort could not be beaten. In Sicily there were enormous stud-farms, where the conversion of corn land into pastures had begun in the early Empire ; when Gregory the Great was selling off the horses on the property of the Church in Sicily, a mere four hundred that were to be left seemed too inconsiderable to take into account. Sicilian race-horses were also highly esteemed. In Greece the increasing desolation also converted wide areas into pasture, and Thessaly, Aetolia, Acarnania, Arcadia, Epidaurus and Sparta, all furnished good horses. Of horses from other provinces the African, to be distinguished from Moorish and Cyrenaic, most frequently occur ; African horses of Spanish blood were reputed the best runners, though this title fell in the third

and fourth centuries to horses from Cappadocia and Spain. At this time Antioch, the luxurious capital of Syria, was famous for its circus, and gave no thought to the frightful expense and distance in importing Spanish horses from the Tagus and Guadalquivir to its races.

Racehorses, to be at their best, were either three or five years old, and, judging from their names on lists and other documents, they were mostly male. Their life was surprisingly long. Tuscus was the leading horse of Fortunatus of the Greens, and won 386 victories, and Victor belonging to Gutta Calpurnianus, 429; hence, 'they must, on any calculation based on our sources, have run at least four times as often in the four-in-hands, some 1,600 or 1,700 times; and the Great Circus was over a mile round. Yet one hundred victories was a great achievement; such a horse was called *centenarius*, and probably had special harness'. Naturally such animals fetched high prices, and cost more than slaves; they were carefully bred, and victorious racehorses sought out as stallions. Connoisseurs were very well acquainted with the pedigrees and records of famous horses, and had many a tale to tell of their intelligence. Thus Pliny says that at the Secular Games under Claudius one White charioteer was thrown out at the start, but his horses led the way and reached the goal first, of their own exertions. Another writer remarks that in the Circus horses were encouraged by flutes, dances (?), gay ribbons and burning torches. In the four-in-hand races, the most common, the best horse was always put on the left outside, as its speed and skill in turning determined the victory; and that horse was anxiously watched by the spectators. The names of them were on everybody's lips; they were greeted with acclamation in the Circus; every one knew which was running, Passerinus or Tigris; Martial, in spite of his fame as a poet, was not better known than the foal Andraemon. Monuments representing them are still extant. The passion often became a mania. Caligula is said to have aimed at making the horse Incitatus a consul; and, on days he was to race, soldiers were sent abroad to command silence and quiet for his repose. Epictetus says that one spectator, who saw his favourite left behind, wrapped himself in his cloak and fainted; when it picked up and came in first, he had to be revived. Nero awarded veteran

racehorses maintenance-money, as also did Verus and Commodus.

The providers of the festivals could seldom themselves find the men and animals, and the business was taken over by capitalists and large owners of slaves and stud-farms. Generally there were four chariots in competitions, and there were four firms for the four colours or parties. At the head of each faction were the *domini factionum*, there being one or several, nearly all, like the business classes, knights, though charioteers occasionally attained this rank. The providers of the festivals had to arrange with these companies, whose prices varied, according to occasion. When Nero, at his accession, extended the Games to performances of several days, these directors declined letting out their men, except for short periods, and treated the consuls and praetors with great arrogance. In 54 A.D. the Praetor Aulus Fabricius would not accede to the firms' demands, and ran his chariot with trained dogs. The Reds and the Whites gave way; the Blues and Greens only after Nero fixed the price. Commodus is said to have increased the games, in order to enrich the directors, who often received gifts. Gordian I, as a private man, distributed one hundred Cappadocian and one hundred Sicilian horses amongst them, obtaining the necessary imperial licence; and Symmachus at the Quaestorian Games of his son gave each of them five slaves. Once only (6 A.D.) is there any mention of the directors instituting Games at their own expense, and then together with the pantomimes; but in later times, shows given by the pantomimes, perhaps in conjunction with the directors, are mentioned on several occasions.

The numerous staff of the factions consisted partly in slaves, partly in paid freemen, and included the grooms for the stables and the Circus, besides artisans, artists, and officials of all sorts. Wheelwrights, shoemakers, tailors, pearl-workers, physicians, instructors, messengers, runners, cellarers, and administrators are mentioned in lists of the employees, and shifted from one faction to another. The stables of all four were in the IXth Region, probably at the base of the Capitol near the Flaminian Circus. In part, at least, these quarters had been built by the Emperors (Vitellius, despite his short reign, contributed large sums), and were very splendid;

Caligula used to frequent the Green stables, and dine there. The relation of the factions to the fisc and the city administration is obscure.

The colours were White, Red, Green and Blue. White and Red were the original parties ; their early history is unknown ; there is a contemporary reference to them in the first century B.C. Perhaps Green and Blue arose under the Empire. Domitian added two new colours, Gold and Purple, which may have been purely imperial : these two soon completely disappeared. The Greens and Blues, from the Early Empire onwards, thrust the older parties out of view ; possibly they amalgamated, the Whites with the Greens, and the Reds with the Blues, without altogether losing their identity. In Constantinople of the eighth century these were the four colours, but a writer of the twelfth speaks of the factions as things of the past.

The Circus factions in Rome and Constantinople are amongst the most remarkable phenomena of the Empire. The whole huge population, from the rulers of the world down to the proletariat and the slaves, were divided into four, later on into two, hostile camps. The unnatural politics of the time and the growing demoralization and brutalization of Rome are hereby clearly exemplified. To the Government this diversion of popular passion was extremely useful, and no one, it seems, endeavoured to stem it. Several Emperors were overt partisans, Vitellius and Caracalla for the Blues, Caligula, Nero, Domitian, Lucius Verus and Elagabalus for the Greens, who maintained the leadership in the Early Empire. But the Emperors not only incited the factions, but terrorized their antagonists. The factions found great support amongst the people in the large numbers their organization employed ; an influence they no doubt confirmed to the utmost. But still more significant was the fact of the four colours ; a party-cry was supplied to the populace, which could not understand horses and racing, but could always rally to the meaningless colours. For five hundred years this party-cry was inherited from generation to generation, in a decadent population, and at the one spectacle, the Circus, where excesses and bloodshed were rife. Nero or Marcus Aurelius might be the master of the world, the Empire might be at peace or tottering in civil war and insurrection, the barbarians on the frontiers

advancing or driven back ; at Rome for high or low, free or slaves, men or women, Green and Blue was the one theme of anxiety and hope. Christianity dethroned the Gods of the Circus ; but the Factions lived on, the Christians were not always restrained by their preachers from the arena. Why should they disdain God's boons ? Had not Elijah gone to Heaven in a chariot ? Could then charioteering be sinful ? Leo the Great, Bishop of Rome from 442-460, complained that his people visited the Circus more than the shrines of the martyrs, who had saved Rome from utter destruction by Attila. When the barbarians were threatening Carthage (439), according to Salvianus of Massilia the presbyter, the Carthaginian mob flocked madly to the racecourse. Trèves, thrice conquered and destroyed, found its few surviving noblemen demanding games from the Emperors to be celebrated on the charnel-house of their own dead.

But this infatuation reached its height, not at Rome, but, in the East, at Constantinople, where, as early as the middle of the fourth century, this passion led to riots. At the time of which we know more, in Rome, despite the continuance of the Reds and Whites, the struggle was only between the Greens and Blues. But at Constantinople the conflict was often religious and political, and all the more savage and endemic. For his faction every man endured torture and death and committed crimes ; above country, kin, friends, home, faith or law, stood Party ; even the women, who then never attended the spectacles, were tainted : it became a general mania. The Nika riot, which broke out in the Circus of Constantinople in 532 A.D., would have cost Justinian his life, but for the presence of mind of Theodora his wife, and the loyalty of Belisarius ; thirty thousand are said to have perished. Probably, too, the adherents of the parties wore the colours in the Circus ; an epigram of Martial, however, is the sole authority, which says, that a Green or Blue devotee should not wear a scarlet toga ; should he get one in a lottery, it might shake his loyalty.

Contemporary references to the Roman Circus and the Factions are too scanty to enable us to trace the growth of the gigantic evil. We can only deal with isolated indications of the magnitude and extent of the passion. In the last century of the Republic, at the funeral of a Red charioteer, Felix,

one of his supporters threw himself on the same pyre. Pliny the Elder reports this on the unimpeachable authority of the Official Journal, and adds, that the opposition party, to depreciate the artist's fame, alleged the suicide was stupefied by the fragrances burnt with the body. But, despite this case, even in Augustus' time, the Factions cannot have been as developed and organized as they were fifty years later. Ovid places one of his elegies in the Circus ; he is looking at the races in his lady's company ; a motley throng is bursting out of the *carceres*, but he and she gaze only at one charioteer, disregarding his colour. Horace often refers to the Theatre and the gladiators, hardly ever to the Circus, never to the factions. It was in the course of the first century, partly as a consequence of the infatuation of Caligula, Nero and Vitellius, that the system grew up. Caligula's partisanship for the Greens has been mentioned ; according to Dio, he had the Blue charioteers and horses poisoned. Nero, as a schoolboy, was blamed by his teacher for his incessant talk about the Circus ; once he disobediently lamented the fate of a Green charioteer dragged along on the ground by his horses ; and, when reproved, said he was speaking of Hector and Achilles. As Emperor he did more than merely favour the Greens actively ; he wore Green in the Circus, and had the Circus strewn with green copper dust (*chrysocolla*) instead of sand ; as also at the spectacles in honour of Tiridates, the King of Parthia. Vitellius even deigned to act as groom for the Blues, and owed his nomination to the post of Governor of Lower Germany to Titus Vinius, a favourite at the Court of Galba, and a Blue partisan. As emperor, he sought for popular favour in the Circus by a degrading exhibition of partisanship ; but he also had some men who decried the Blues out loud, executed, interpreting the expression as an execration of [himself, and a herald of revolution. Though the succeeding emperors took no direct part, the factions and the passion for spectacles developed at the same rate ; and, at the end of the first century, the mania obsessed the whole mind of Rome, leaving no room for culture, and giving deeper thinkers much matter for earnest thought. Youth at home and at lectures discoursed of nothing else ; even the teachers had to condescend to take part in such discussions. Amongst educated men the feeling that it was safe to talk about the

Circus made the topic a favourite one. The time when the Roman people was engrossed in *panem et circenses*, was the zenith of the Empire. In Trajan's reign, unprejudiced observers wondered why, in the Circus, attention was given, not to the speed of the horses nor the skill of the men, but to pieces of coloured cloth, which, if exchanged in the race, changed men's sympathies as well. And then, the same people who were acclaiming by name horses and drivers would suddenly abandon them. And it was not only the people. Serious men found an insatiable delight in them. Pliny the Younger (from whom these reflections are quoted) was almost proud of his superior indifference. Juvenal, writing under Hadrian, says that a defeat of the Greens in the Circus was deplored at Rome, as though it were a Cannae. Marcus Aurelius, who was brought up at the Court of Hadrian, thought he was especially indebted to his preceptor for preserving him from this partisanship. No doubt this was an innuendo against his colleague, Lucius Verus, who was a keen devotee of the Circus, kept up a large correspondence on it with the provinces, and an over-zealous partisan of the Greens; hence, even in the presence of Marcus Aurelius, he had to put up with abuse from the Blues. Fronto, the tutor of both emperors, was not saved by his pedantry from this besetting passion; not unnaturally, he sided with his imperial pupil, and not even bad gout made him abstain from frequenting the Circus. In an account of Rome by a Greek tourist, written about this time, the circus-life, the statues of charioteers and general conversation on horses, and this hippomania, even in the great men, is the main characteristic; he does not deal with the significance of the Factions, a point which might well escape a foreigner. Yet Galen, who from 163-5 and occasionally from 169 onwards was in Rome, dwells on the senseless interest in the four colours, and notes that the partisans of the Blues and the Greens smelt the dung of the racehorses, to satisfy themselves as to the digestibility and fitness of their fodder.

There are only extremely scanty sources for third century history; the Circus and the factions are scarcely mentioned, except perhaps under Caracalla, who in shameless publicity drove his chariot on the course and once, on hearing outcries against a charioteer of his party (the Blues), gave orders to

the Guard to kill the offenders, and made the Circus a scene of slaughter and confusion. One hundred and fifty years later Ammianus Marcellinus describes Roman morals at an epoch of utter decay from within, and imminent danger from the East and the North ; but even he, filled as he was with astonishment and contempt for the passion for the Circus, never mentions the Factions. To the mob, the Circus was its temple, home, place of assembly and ideal. Everywhere groups of men would stand eagerly discussing the events ; grey-haired men, boasting of their experience, swore that the Empire was doomed if their predictions turned out wrong. On Circus-days the people flocked to the course before sunrise, or passed sleepless nights in anticipation. It was a wonderful sight, this immense throng absorbed in the races. But no less keen were the haughty nobility who received messengers to hear of the arrival of new horses and drivers, like the Dioscuri of old, who brought news of the victory over Tarquin. And, a century and a half later still, when the Empire was a thing of the past, swept away in the stream of barbarians, when Rome was being governed by Theodoric the Goth, the Circus still rang to the same passions. Theodoric left Rome her beloved games, and was hence often greeted as Trajan and Valentinian, whom he took as models. In 509 there was a fight in the Circus. Two senators, Importunus and Theodoricus, adherents of the Blues, attacked the Greens ; one man was killed. In a rescript relating to the Circus, and drawn up by Cassiodorus, the learned private secretary of the King, the excitement of the passions in the Circus is remarked on as strange ; it was so much greater than in other spectacles. Whichever faction win or lose, one half of the people is in despair ; there is no triumph, but they exult ; no disaster, but they lament ; these petty quarrels are as keenly felt as though they were national losses. The games destroyed moral purpose, gave an incentive to paltry disputes ; uprightness vanished, and discord flourished. Finally, the rescript runs, it is rightly said that a spectacle involving so much dishonour is aptly dedicated to idolatry. And the King tolerated it only to afford the people some relief ; he had sometimes to act foolishly, if he was to please them. Further, under Theodoric the whole of the Circus was no longer used for chariot-driving. One of the rescripts mentions that Volusianus

a senator owned a tower of the Circus (and a seat in the amphitheatre) which was illegally taken from his children.

Thus the rivalry of the colours survived the Western Empire, and died out only when the Circus vanished. The last race was held in the deserted and impoverished city in 549 under Totila the Goth.

§ 2

At the end of the fourth century, Symmachus was engaged in a correspondence on the preparations for his son's Praetorian Games. This source, though late, gives a standard of the magnificence which high officials, even in the earlier Empire, lavished on their celebrations. For Rome can hardly have had less wealthy and luxurious senators in the earlier Empire than under Theodosius, and the preparations can only have varied in kind, in the stagings, the horses and attendants. In the early Empire the factions apparently undertook this work, whilst Symmachus, to judge by his letters, himself bought or hired charioteers and horses. Symmachus, as above mentioned, was only moderately opulent for a senator of his time; but his games aroused great attention and are a standard for the more gorgeous.

Quintus Aurelius Symmachus owned three palaces in Rome, had held every highest office of State, and was in every sense one of the greatest men of his day. With a number of like-minded spirits he made every effort to assert the fallen cause of paganism against the victorious onset of Christianity. The aims of himself and his associates were, as much to revive classical literature as classical faith, with which the spectacles were so closely connected; and the games, regarded by Christians as an idolatrous horror, were all the more treated by Symmachus as a holy obligation, a great prop for his creed, the more so as he held two of the highest priesthoods. Other worldly considerations also stirred his zeal; a high conception of what was due to the majesty of Rome, the dignity of his house and the wishes of his order. He therefore strenuously availed himself of every resource of his great influence and wealth, and his far-reaching connexions, to outbid the great expectations of splendour at the games for his son's praetorship. The horses he imported almost entirely from Spain. A man of his station could easily obtain the privilege of using

the imperial post for his agents. Thus numerous agents of his, well provided with money, instructions and letters of recommendation to the best breeders, and connoisseurs, travelled to Spain, sure of the support of powerful individuals and corporations. Symmachus thought he must satisfy the popular desire for variety : hence he requests a breeder Eupraxius to get him four four-in-hands from one Laudacius, though Eupraxius' were acknowledged the best horses. Further, his agents were commissioned to secure the best racehorses of all breeds. This careful selection made the arduous business even slower ; and he had to await the spring, before the transportation to Italy could be carried out. To provide for this eventuality, Symmachus directed a friend in Southern France to keep the selected horses in his stables for the three or four winter months, and, should any specially good racehorses be for sale near Arles, to purchase them as well. But this long journey necessarily involved the certainty of disease and accident thinning the numbers ; of four sets of four-in-hands sent him as a present by one Sallustius, only eleven arrived alive, and some of these even died soon after. Hence the offers of Helpidius, a horse-breeder in Italy, were accepted. Symmachus asks him to send the best of his chariot-racers, and to consider quality rather than quantity, as the certainty of a large number from Spain made the selection of Italian horses very narrow.

Defective and irregular communications by sea made the arrival of the charioteers doubtful, though these came from no further than Sicily. As soon as his Sicilian agent advised him of their departure, he commissioned his son-in-law in the Gulf of Naples to send reliable men all along the coast to Salerno to receive them ashore. Then a mutual friend was to furnish anything necessary, and to despatch them by ship to Rome. But time went by, and no news came of their arrival. Symmachus thought fit to demand an official inquiry on the coast. Whether the ship arrived in time, we do not know.

The days preceding such festivals, entailing such tremendous preparations, filled all Rome with eager suspense. Conversation turned on nothing but disputes and bets. Soothsayers were consulted. Firmicus Maternus recommends astrologers to keep aloof from the Circus, in order not to be identified with any party. Magic was employed to accelerate or retard the

pace. Tablets of lead were laid in graves and the daemons conjured to injure or slacken the speed of the horse and charioteer specified ; a number of such tablets have been found on the Via Appia and at Carthage. The daemon (so runs one of them) is to take the strength out of the horses, that they might neither run, nor leave the starting-point, nor gain in the race, nor turn at the goal-pillars, but there upset with their drivers. Or the daemon is to make the drivers blind, or hurl them out of the chariot, if possible near the goal, and thus drag them along, to the injury of themselves and the horses. Or again, a chariot-driver must be ' fettered to-morrow in the Circus, like this cock, hand, foot and head '. Ammianus tells of a charioteer, who was condemned to death in 364, since he confessed to apprenticing his son, a boy, to learn forbidden lore of a magician. Another man prayed to St. Hilarion for protection against a magician, who had enchanted his horses so that they could not run. Cassiodorus mentions that Thomas, an Oriental charioteer at Rome, was suspected of magic by reason of his frequent victories. The lead tablets on the Via Appia date from 390-420 A.D., and at least one of the charioteers named was a Christian. The Circus employees, whose superstitious vein was heightened by the danger of their profession, no doubt used amulets. Besides amulets, charioteers, athletes and other performers of the fourth and fifth centuries wore embossed medals with high rims (contorniates), with an effigy of Alexander the Great, who was supposed to ward off accidents, a widely spread belief. The horses had bells hung on them, to guard against enchantment.

And, on the great day, hours before dawn, the streets were thronged. Once Caligula was disturbed in the middle of the night by the noise of the crowd going to the Circus ; he had them cudgelled away, and in the crush twenty knights, twenty married women and a large number of the poor perished. Elagabalus is said to have thrown a large number of snakes into this crowd ; the people, bitten in the dark streets, fled, and many were injured. Under Claudius and Nero knights and senators had special seats, with easy access, whilst the thousands of the third estate had to crush into theirs, despite the many entrances ; the Circus, at any rate in the earlier centuries, was never large enough for the vast number of eager spectators. People of moderate means, in Trajan's

time, longed to possess two sturdy Moesian slaves, to carry them safely to a good place in the Circus. Cushions stuffed with rushes also seem to have been sold to the public. Further, the whole space could not be covered with an awning, and against wind, or rain, or sun, there was no means of protection, save cloaks, hats, and umbrellas. For all that, women were the most devoted frequenters, and came, despite the dust, and crowd, and heat, in their best; they sat with the men, and increased the attraction for them.

A religious ceremony preceded the games. Down from the Capitol came a great procession with the sacred statues and went over the gaily bedecked Forum; thence through the shops of the Tuscan quarter, and over the Velabrum and the Cattle-Market, and so through the middle gate into the Circus and round the goal-posts. The magistrate giving the spectacle led the procession; a praetor or consul standing in the dress of a triumphant general on a lofty chariot; the folds of the broad gold-braided, purple toga round him, and beneath it a tunic embroidered with palms, and the ivory sceptre with an eagle's head in his hand; and, over his head, a huge wreath of golden oak-leaves set with jewels, was held up by a public slave. On the chariot or the horses his children also sat, as at a triumph. Musicians and other attendants preceded him, and a host of clients in white toga surrounded the car. Augustus once, when ill, had himself carried in a sedan-chair, in order not to miss this honour. To the sound of flute and trumpet, the procession entered; the statues of the gods carried on thrones and litters, or gorgeous cars drawn by mules, horses or elephants, decked with their attributes, and accompanied by the priesthood and religious corporations. The ceremonial exactly followed the pedantic cult of Rome; the least mischance might invalidate the celebration, and make a new start essential. Those who were interested in repetitions, could easily cite some breach of the ceremonials; but Claudius decreed that the games might only be renewed for one day and so practically annulled the abuse. The assembly rose from their seats at the entry of the magistrate, and cheered him; and, as in modern Italy at processions of emblems of the saints, many invoke their patrons, so in ancient Rome country-folk greeted Ceres, soldiers Mars, lovers Venus, and believed, as Ovid hints, an unsteady statue was nodding to them.

Political feelings might also be expressed, especially as pictures of the emperor and the imperial family were also carried in procession, especially those upon whom divine honours were bestowed. Serious thinkers under Titus or Trajan might well reflect, and see dismal glimpses of the past, whilst the figures of the beautiful men and women of the Caesarian family passed by him. But most of the spectators regarded the procession so decorous and slow, and almost endless, as a tedious prelude.

To determine the bounds of the races, at the start and end of the course three conical pillars were erected, and for the whole length between these two points a low wall (or walls with a moat) was drawn, on which stood the two obelisks, and also sacred statues, pillars and shrines. Originally the great Circus had four gates on each side of the great central gate, that is, eight in all, increased possibly under Domitian to twelve, when he created the two new factions. Hence, after the four factions system was restored, each party might run three chariots; but this seldom happened; two were frequent, but one the most usual. Diocles won 51 races with three chariots, 347 with two, and 1,064 with one. The ordinary four racing chariots started from the four gates on the right of the principal entrance. To make the distances equal for the cars, the wall between the gates was a curve, the gates nearest the middle being farther back, and the other curving in; further, these starting points were probably assigned by lot. The chariots, starting from the entrance, proceeded through the road on the right of the wall up to the farthest boundary-pillars, steered round them and returned to the starting-point on the left of the wall. This round was taken seven times; and, to inform the spectators at any instant how many circuits had been made, seven dolphins and seven egg-shaped balls were planted high up on the wall between the boundary pillars, and one was taken down at each completed round. The chariot won, which at the seventh round first passed a chalk line, drawn near the entrance on the left. Second and third prizes were also awarded.

The number of these seven-lap races varied. In the Early Empire ten or twelve a day was the normal; in 37 A.D., at the inauguration of a Temple of Augustus, Caligula had twenty

on the first day, and twenty-four on the second. This number, which made the games last from the morning until the evening, became usual; and, after Nero, only at minor festivals were there fewer races. More than twenty-four were only given on extraordinary occasions, if two festivals coincided (e.g., in the fourth century, Trajan's birthday and Constantine's victory over Licinius on September 8, and, on November 8, the birthday of Nerva and that of Constantius II, both double festivals were celebrated with forty-eight races). On three other days of high significance thirty or thirty-six were given. But when over twenty-four were given, the length of each may have been shortened.

Races were usually with four or two-in-hands, rarely with three-in-hands. Tiros began with two-in-hands. The tombstone of a slave charioteer at Tarraco, who died at the age of 22, runs: 'In this grave are the bones of a novice of the racecourse, but not unskilled in the art. I already had begun with four-in-hands, though still confined to two horses'. But Crescens (see p. 23) at the age of thirteen drove a four-in-hand, and boys even younger drove two horses. The experts (who delighted in extraordinary feats) would drive six, seven, eight and ten horses. Nero drove a ten-horse chariot at Olympia, though in one of his poems he blames King Mithridates for this practice, and received the prize, despite an unlucky run. Mithridates is said to have driven sixteen. The two-wheeled chariots, familiar from numerous ancient representations, were light and small. In the case of four-in-hands, the most popular form, the horses were harnessed next to one another, the best outside on the left, the middle ones yoked, or the three on the right only reined in. On exacter representations the tails of both outer horses are fastened together or docked, to prevent entanglements with other chariots. The charioteers stood on the cars with a short tunic braced round the body, the arms bare, a helmet-cap on their heads covering their foreheads and cheeks, to afford some protection in case of a fall; whip in hand, and a knife in their broad belts to cut the traces in the last extremity, a precaution necessitated by the practice of fastening the reins to the belt. As a remedy against the constant injury from being dragged on the ground or run over, the drivers used boar's dung without

and within ; Nero is said to have drunk the ash of it in water. The tunics and harness were in the four colours.

When the races were starting, there was a low buzz of expectation in the sea of spectators. No eye but was turned to the vaulted, roped-in gates by the entrance, in which the four-in-hands stood chafing and stamping. The president from his balcony above the main entrance dropped a white handkerchief as the signal. Ennius' description of the people in the Circus anxiously awaiting the Consul's signal answers exactly to Tertullian the Christian's account of the heathen spectacle he regarded as damnable ; he looked on the falling handkerchief as a symbol of the fall of Lucifer. The ropes dropped, and from the open gates the chariots stormed into the course, raising clouds of dust, although doubtless the arena was watered in the intervals. A great cry burst out. The drivers bending forward, urged their steeds onward. The total distance on their seven laps was about eight kilometres ; no race could have lasted over a quarter of an hour. Skilled drivers employed every device to win. Once ahead they would drive askew to block the road or, if in the middle of the chariots, 'trusting to a freer course' would bend to the right, or would drive straight home : but they aimed especially at postponing any decisive issue to the finish, spared their strength for the last lap, and then easily overtook the novices who had passed them at first and were now vainly lashing their exhausted teams. Every turn, every instant was of import to the drivers and intelligent onlookers, and an indication of the result. Victories of drivers who were last at the beginning were more esteemed than a clear lead from the outset. Often the drivers fell off and were dragged on by the horses ; but the great test and difficulty lay in the seven turns round the goal. The attempt to choose the shortest way often brought about collisions with other chariots or the post, and chariots, animals and drivers lay in frightful confusion on the ground.

But, as a Christian writer properly says, the great spectacle was the spectators. The long rows of rising seats were thronged with a moving mass of men, moved by one passion, almost a mania. Near the close of a race suspense, anxiety, fury, joy, savagery burst forth. Their eyes ever fixed on the chariots, they clapped and shrieked with all their lungs,

sprang up, bent over, waved handkerchiefs, incited their favourites, stretched out their arms as though they could reach the course, gnashed their teeth, groaned, threatened, exulted, triumphed, or swore. The winning chariot aroused a thunderous applause—and loud curses from the losers—re-echoed over the deserted streets of Rome, announcing to those who stayed at home the end of the race, and struck the ear of the traveller, when Rome had vanished from sight. The races lasted unintermittently (except for short pauses at midday) from daybreak to sundown, but the people sat there patiently, despite sun and rain, and never wearied of following their idolized sport with the same passionate attention.

The valley between the Aventine and Palatine, once so full of noise and life, is now one of the dreariest and most solitary parts of ancient Rome. On the Palatine are the vast ruins of imperial palaces; on the Aventine a few churches and cloisters stand amid vines and gardens. Great rubbish heaps of the once gorgeous temples and palaces choke up the slopes of the Aventine and the valley. In this desolation there is a miserable cemetery of the Jews. The brook of Marrana runs at the bottom of the valley, and on its banks an impenetrable forest of Roman reeds, exceeding a man's height, whispers and rustles.¹

II. THE AMPHITHEATRE

The party system ensured the closest interest of the populace in the Circus, almost its participation, and the preparations were comparatively inexpensive; at the other spectacles, to retain the attention of the public was more difficult, and various entertainments had to be lavishly provided. In the Amphitheatre most colossal efforts were made, and exciting spectacles, fairy-like splendour, a rapid succession of surprises and the charm of the infinite, the bizarre and the monstrous were always being offered, in order to surpass, or at least to meet, the claims and expectations of the spoilt capital.

¹ Written in 1864.

(1) THE GLADIATORIAL GAMES

(a) Gladiatorial fights originated in Campania, as a dessert after gorgeous banquets, were native to Etruria, but in Latium an innovation. Five centuries after the foundation of the city, Rome saw them for the first time; for the first four centuries of the Republic exhibited only at public funerals, not, like plays and races, at State festivals. The rarity became usual, and more and more gorgeous and prodigal of human life. In 264 B.C., at the funeral of Brutus Pera, his sons Marcus and Decius exhibited in the oxen market three duels at once for the first time. At the obsequies of Marcus Aemilius Lepidus 216 B.C., twenty-two duels were fought in the forum; and at those of Marcus Valerius Laevinus 200 B.C., twenty-five; and in 183 B.C., at the funeral of Publius Licinius, sixty. In 174 there were several gladiatorial games, the chief of them being that given by Titus Flamininus at his father's funeral, in which seventy-four men fought for three days. One Gaius Terentius Lucanus, who celebrated his grandfather's death with a three days' fight of thirty pairs, placed a picture of it in the Temple of Diana at Aricia, probably about 145 B.C. In 105 B.C. the two consuls, Publius Rutilius Rufus and Gaius Manlius, for the first time gave official gladiatorial games, an innovation directed against Greek culture and also designed to promote military training. Legal provisions were made for official combats of this kind in Rome, the municipia and the colonies.

In the later Republic demagoguery, and the competition for the favour of the mob incited the ambitious to even greater lavishness. In Julius Caesar's games at his aedileship (65 B.C.), he bought so many gladiators that his opponents' anxiety was aroused, and the Senate, at their suggestion, decreed the maximum number any private man might own. Caesar's diminished troop, however, still consisted of 320 pairs. In 22 B.C. Augustus enacted that the praetors should give gladiatorial shows only twice a year, and with never more than 120 combatants. But at private combats, 100 pairs then and later was quite an ordinary number. In a poem probably previous to this decree Horace mentions that one Staberius imposed on his heirs the obligation to inscribe on his tomb the amount of his property, or, in default, to give

the people a hundred duels and a public banquet. Persius makes a rich man express his intention of honouring the Gods and the Genius of Caligula with an exhibition of a hundred pairs of gladiators, for Caligula's victories over the Germans. Tiberius' limitation of the number of pairs can only have applied to private exhibitions; Augustus' decree already held for public ones. In the eight spectacles given by Augustus, he himself says that some 10,000 fought. This same number fought in the four months' spectacle at Rome given by Trajan after the conquest of Dacia. Magistrates' celebrations were sometimes as magnificent. In 70 A.D. Caecina and Valens, the consuls, celebrated Vitellius' birthday (September 7 or 24) with combats in all the 265 districts of Rome, 'on a vast and unparalleled scale'. Gordian I in the year of his aedileship, gave gladiatorial games every month, with at least 150 pairs, sometimes 500 at each: some 4,000 or 5,000 men must have been required in the course of the year.

With the numbers the style of the spectacles became more elaborate. In the second century B.C. the cost of a brilliant gladiatorial show was reckoned at thirty talents (£7,073); at Julius Caesar's games the paraphernalia were all of silver; at one of Nero's, of amber. And, as the empire expanded, the natives of the confines were dragged in to the Roman arena. During the Republic, Gauls, Samnites, Thracians were seen fighting; under the Empire, the tattooed savages of Britain, the fair Germans of the Rhine and the Danube, the dusky Moors from the Atlas, African negroes, and Sarmatian nomads. In Aurelian's triumph in 274 A.D., in front of the emperor's chariot there marched captive Goths, Alani, Roxolani, Sarmatians, Franks, Suevi, Vandals and Germans with shackled hands, Palmyrenes and Egyptian rebels, and ten Gothic amazons; some, if not all, had to fight in the arena. After Probus' triumph over the Germans and Blemmyes (of Aethiopia) three hundred of the prisoners had to fight together; these were Germans, Blemmyes, Sarmatians and Isaurian bandits. At the end of the fourth century Saxons were also seen fighting in the Roman amphitheatre, if not earlier.

These foreign combatants brought their own weapons and style of fighting; the Thracians with their little round shields, the Samnites with large square shields, the Parthians with

their chain-armour, the Britons with their war-chariots; and where national habit was not various, fancy supplemented. Gladiators would appear in most diverse accoutrement, singly or in troops; regular battles were waged with thousands fighting, and the arena left covered with bodies: and famous sea-fights would be literally re-enacted on lakes, or the flooded arena.

Yet soon bloodthirsty combats and magnificent scenery failed to excite the dulled nerves of the mob, aristocratic or vulgar; only things absolutely exotic, unnatural, nonsensical, tickled their jaded senses. Domitian gave gladiatorial combats and animal hunts by night, and the swords reflected lamps and candelabra. In the December festival of 88 he set dwarfs and women fighting. At the spectacles given by Nero to Tiridates, the King of Parthia, at Puteoli, on one day only Moors of both sexes appeared, and of every age. Women often fought in the arena: in 64, under Nero, even noble women; as late as 200 A.D. the practice had to be formally prohibited.

Thus in the course of centuries from small beginnings the gladiatorial games had become an immense institution. The accommodation for spectators correspondingly increased. Even in the later Republic the people assembled on hastily erected scaffoldings in the forum, when, in Campania even, there were stone amphitheatres, which, duplicating the semi-circular theatre, rose above an elliptical arena; under Augustus the name of amphitheatre had arisen. In 53, according to Pliny the Elder, Gaius Scribonius Curio had two wooden theatres built, back to back, but reversible. Before noon they were used for stage-pieces; then, with the entire seated crowd, they were turned on pivots, and the completed amphitheatre served on the same afternoon for gladiators. The first real amphitheatre in Rome was built by Caesar in 46 B.C. of wood; a stone one built by Statilius Taurus in 29 B.C. was probably burned at Nero's fire; Nero even built a wooden one on the Campus Martius. Only at about 90 A.D. was the Colosseum of the Flavians finished, in its ruins a gigantic monument of that sunken world.

(b) Gladiators were recruited from condemned criminals, prisoners of war, slaves and volunteers. ~~Condemnation to death by gladiators or wild beasts was one of the severest~~

sentences, the latter being pronounced against non-citizens and, in the later Empire, the third estate. Under Marcus Aurelius the governor of Lugdunensis, with the authority of the Emperor, had the condemned Christians, who were Roman citizens, beheaded, and the rest thrown to the beasts. But condemnation to the school of gladiators did not spell death. Criminals who might fight well were handed over partly to private establishments, and partly to the imperial ; and, should they not fall in the arena, had a chance of life. The punishment ranked with condemnation to the mines, and both entailed loss of freedom. But release might be obtained, and, after three years, the wooden sword, the token of relief from the arena, and after five the hat, or symbol of manumission, might be obtained. Pliny the Younger informs Trajan that in many cities of Bithynia, especially Nicomedia and Nicaea, many culprits condemned to several years of the gladiator's school or similar punishments are used as city slaves for public purposes, without any evidence of pardon by a proconsul or legate. Trajan decreed that criminals condemned within the last ten years should be sent back to the school, and those of remoter sentence, and the older men, turned on to heavy work, such as the cleaning of sewers, and building of streets. Only the worst offences incurred such penalties, such as robbery, murder, arson, sacrilege and mutiny, but the restrictions of the law were often overridden by the imperial caprice, if men were lacking for the arena.

This abuse was common enough among the provincial governors under the Republic. Cicero asserts that Lucius Piso Caesoninus, when proconsul of Macedonia, sent Publius Clodius for his aedile games a large number of innocent men, to fight wild beasts. Lucius Balbus the younger, as Quaestor in Spain (44-43 B.C.), twice endeavoured to force Fadius, a Roman citizen and Pompeian soldier, at Gades, to fight as a gladiator ; he failed utterly and the people protected him, so he sent Gaulish cavalry to capture him and had him burned alive in the Gladiators' School. He cast Roman citizens to the wild beasts and one man from Hispalis on account of his having a deformity.

Atrocities of this kind occurred in Rome, at least under Caligula and Claudius. Caligula coerced a large number of

citizens into the arena. One citizen, Esius Proculus, the son of a *primipilaris* and called Colosseros for his stature and beauty, he had removed from his seat during the games, and compelled him to fight two heavily armed gladiators, one after the other ; Proculus overcame both, and was beheaded for his pains. Claudius delighted in animal-baitings, and condemned great swindlers to this punishment, in contravention of the law ; he would make men face animals for the slightest offences, carpenters and engineers for bungling a change of scenery. Besides, the extraordinary number of supposed criminals condemned to the arena is in itself suspicious. Justice cannot have been even. In the naval fight performed before Claudius on Lake Fucinus, both fleets had 19,000 men at arms, according to Tacitus, all condemned criminals ; a number large even when we consider they were brought out of all the provinces to Italy. In Rome a large number of convicts were at the disposal of the arena ; thus Hadrian, to show his contempt of the presents given by Palasmanes, the King of the Iberians, ordered three hundred criminals to appear in the arena with gilded cloaks, a portion of the gift. Herod Agrippa, the King of the Jews (died in 44 A.D.), set all the condemned criminals of his realm, 1,400 in number, fighting in his amphitheatre at Berytus. At the popular desire, criminals, who distinguished themselves for bravery, or on other grounds, used to be pardoned. At the games given by Nero in his new amphitheatre on the Campus Martius he, of his own accord, forbade the killing of any of the criminals.

Any successful campaign brought hundreds of prisoners of war into the imperial gladiators' schools, and the spectacles of the amphitheatre were the readiest means of getting rid of them. Thus was it with the Britons captured and brought to Rome under Claudius in 44 A.D. After the conquest of Jerusalem Titus sent a portion of all the captives over seventeen years old into the Egyptian mines ; and most of the rest to the provinces to die at the hands of gladiators or wild beasts ; a large number he despatched in this way at once to Caesarea Philippi and Berytus. Constantine the Great followed the same example. The Bructeri 'too unreliable to be soldiers, and too savage to be slaves', were thrown to the wild beasts, probably in the amphitheatre of

Trèves, and the Emperor was exalted 'for making the general annihilation of the foe a public amusement: what better triumph?'

Part of the slave armies of the rich at the end of the Republic must have consisted of bands of gladiators, serving their owners as braves or bodyguards, used for private spectacles, or lent out. A farce by a poet under Sulla even, called 'The Hired One', contains words spoken by a gladiator. 'I do not belong to Memmius, or to Cassius or Munatius Ebrus'. Cicero made special inquiry after the troop bought by Atticus in 56 B.C.; he heard that they fought splendidly, and, if Atticus would have hired them out, he would have recovered his money after the second exhibition. Many of the great men then had private fighting-schools, principally at Capua, which turned out hundreds of gladiators. The most ancient recorded there is that of Aurelius Scaurus (Consul in 108), which is mentioned in 105 B.C. In 73 B.C. 200 gladiators resolved to escape from the school of Gnaeus Lentulus Batiatus; only seventy, under the leadership of Spartacus, succeeded. Caesar, too, had his gladiators in Capua, and recommended them in 49 B.C. to Cicero; Lentulus as Consul summoned them to arms in the cause of freedom, and used them as cavalry; this measure was generally deprecated, so Pompey distributed them amongst the citizens, as a bodyguard, giving each man two. At Ravenna, just before crossing the Rubicon, Caesar considered the plans of a new gladiator school. In the Catilinarian War, it was proposed to intern the Roman gladiators at Capua and other *municipia*. Catilina reckoned on them 'though they were better-minded than many patricians'. Gaius Marcellus, the Catilinarian, took flight when Cicero despatched Publius Sextius to Capua, but had, whilst there, practised with the most numerous troop in the town, in order to win it over. In 65 B.C. the largest number any private individual might own was fixed by the Senate (see p. 41). Caligula allowed this maximum to be exceeded. When under Domitian the State took over the provision of gladiators, private men may have been forbidden to keep them in the capital. At Rome, the practice of going out publicly with such a train (as did Nero on his night excursions) must have ceased at an earlier date. But in the provinces the private troops were

not interfered with under the Empire, and may often have been used in their master's service. Thus, when the three Pannonian legions mutinied in 14 A.D. the ringleaders alleged, that Junius Blaesus, the legate in command, kept his gladiators in camp, to corrupt the soldiery, and murder obnoxious individuals. And continually large numbers of gladiators are mentioned as slaves of rich houses. Women sometimes owned them; for instance, a certain Hecataea of Thasos. More frequently families of gladiators were held in joint ownership. One Primus and Pamphilus are designated in gladiatorial tokens (*tesserae*) as slaves of a well-known company. At Pompeii there are advertisements of gladiatorial combats, indicating several troops belonging to the principal men: only one of the owners specified, N. Festius Ampliatus, was perhaps an itinerant troopmaster. The legions, too, at the stations and garrisons of which there were often amphitheatres, sometimes kept their own gladiators. Gladiators passed from owner to owner by purchase, sale, or auction. Caligula used to oblige consuls and praetors to buy the survivors of his combats at enormous prices, and remarked at one of these auctions that the ex-praetor Aponius Saturninus had 'dropped off asleep. The auctioneer was instructed to take his nodding as a bid, and knocked him thirteen gladiators down for nine million sesterces.

In the first century there was no restriction on an owner's right of selling slaves to the arena; Vitellius sold Asiaticus, his favourite, to an itinerant trainer, in a fit of irritation at his prudishness. The first enactment was under Hadrian, which forbade a girl being sold to a pander, or a slave to a fighting school without the reason being assigned: Marcus Aurelius extended it to sales for the wild beasts; this last practice had been already prohibited, except with the judicial consent of the City Praefect at Rome, or the procurator in the provinces, by a *Lex Petronia* under Augustus. Androclus (the slave who, probably under Claudius, was set to fight the lion who recognized him) had run away from his master, when pro-consul in Africa. He was captured and brought back to Rome, and at his master's request, confirmed by the City Praefect, condemned to the beasts. We do not know how far the disposal of slaves as gladiators was limited, apart from this restriction of the penal authority of the owners. It was a problem of the

jurists in the second century, whether it were a case of sale or hire, if a contract were made to pay the owner of a gladiator twenty *denarii*, should he survive uninjured, or a thousand if killed or maimed. Slaves, attempting to evade the punishment for fraud or similar crimes by offering themselves to the arena, were to be returned to their masters, whether or not the combat with wild beasts had taken place, by a decree of Antoninus Pius. One proof of Macrinus' cruelty was considered to be his unreserved condemnation of runaway slaves to fight as gladiators, if caught.

Manumission exempted slaves who had served as gladiators from any further obligation to perform, unlike other freedmen, who still were liable to certain services. But, at their patrons' wish, freedmen also may have fought in the arena, for, as volunteers, they were more respected by the public (which consisted largely of freedmen). One of Trimalchio's guests says that a gorgeous three days' gladiatorial exhibition is coming on, in which a large number of freedmen would perform. Unquestionably, too, free-born men were sometimes coerced to fight, as was Fadius by Lucius Cornelius Balbus at Gades; and it was a grievance of the Early Empire even, that the rich profited by the simplicity of young men, deceived them, and confined the most handsome and best suited for military service to a fighting-school.

Under the Empire free men often enrolled themselves; if Roman citizens, they had to announce their intention to a tribune. Such incidents occurred even in the later Republic. A document of that period makes a citizen of Sassina present a cemetery to his town, from which volunteer gladiators, suicides by hanging, or those pursuing immoral trades were to be excluded. In the *Atellanae* there is frequent mention of such applications. The most ancient of the gladiatorial tokens extant, ranging from Sulla down to Claudius, with a free man's name is of 14 B.C.; but this must be mere chance: out of sixty genuine ones, there are only five names of free-born men. At Pompeii there is a list of gladiators scratched on a wall, on which names of free-men occur, such as Marcus Artorius, and Lucius Sempronius. Sometimes, too, honourable motives may have induced the destitute to join; a favourite subject for romances, and rhetorical themes is, e.g., the noble young man, who enrolls in order to pay for his father's

funeral; the authority, however, is dubious. Lucian's tale of the Scythian Sisinnus also sounds romantic: he, to release his friend from an urgent need, sold himself to fight a gladiator at Amastris for a fixed sum of 10,000 drachmae.

Most, if not nearly all of the applicants who took the frightful oath 'to suffer themselves to be whipped with rods, burnt with fire, and killed with the steel' were the castaways or ne'er-do-wells of society. But such men were by no means few; nor was it the worst class whom love of fighting seduced into the hands of the troop-owners. A poet of Augustus' reign says that these pugnacious men sell themselves to die in the arena, to find an enemy in time of peace. And Tertullian exclaims: 'How many idle men contract themselves out to the sword, for love of combat'. When Severus began recruiting the Praetorians from the legionaries—up to then it had been the privilege of the Italians to serve in this force—Italians able to bear arms joined the gladiators *en masse* or went in for brigandage.

The profession of a gladiator must have really attracted men of rude courage; it had its advantages, rewards, and fame. The victors were generally rewarded: the provider of the festival sent them, whilst in the arena, bowls of gold-pieces, the number of which the spectators shouted out loud or signified with the fingers of the left hand; and the bowls, in themselves valuable, were also part of the prize. Tried fighters commanded high prices: Tiberius paid some veteran gladiators for one appearance 100,000 sesterces. Nero presented the *myrmillo* Spiculus with a palace and the possessions of former triumphant generals. Their splendid equipment also must have had its effect. At Pompeii and elsewhere, fragments of their rich and artistic armour have been preserved; helmets, and one vizor-helmet especially with embossed designs, and greaves, the shoulderpieces of the *retiarii*, belts, swords, breastplates etc. The casques were decorated with waving peacock or ostrich feathers. In picture and mosaics gladiators are represented in gay, gold-laced attire, with necklets (perhaps, like palms, signs of victory). Pertinax sold, as part of the inheritance of Commodus, weapons for gladiators, set with gold and jewels, 'swords of Hercules' and necklets. The heroes of the arena were as popular in Rome as those of the racecourse, not only with the lower

classes ; in the upper, also, they had pupils, admirers and imitators.

In Republican times men played at being gladiators. Lucilius mentions a Quintus Velocius, who was proficient in Samnite fighting, and a good fencer. The Catilinarian Gaius Marcellus, as already mentioned, on the pretext of practising arms, joined a gladiators' troop at Capua. Julius Caesar had his gladiators trained by knights and even senators of Rome, who were skilled fighters ; Suetonius knew of letters of his, still extant, in which he begged them to undertake this tuition. Several emperors sought proficiency in the gladiator's art. Caligula fought as a Thracian with sharp weapons. Titus, in his youth, at a festival at Reate, entered into a mock fight with gladiators' weapons against Allienus (probably Aulus Caecina Allienus, consul in 69). Hadrian also practised in this fashion, and Lucius Verus, too, in Antioch, whilst his legions were fighting the Parthians. Didius Julianus was reproached for continuing these exercises, as an old man ; while he was young, it was excusable. Caracalla and Geta sought the society of gladiators and circus-drivers, when they were Caesars, to learn the art.

But Commodus was the most pronounced sufferer from this passion. He had all his visits to the gladiators' school (where he had a room) announced by herald ; on January 1, 193, he was intending to enter on his consulship in a *secutor's* uniform ; his murderers anticipated him the day before. He delighted in the honorary titles of gladiators, and he boasted of having fought 1,000 times (365 in his father's reign, and also at the spectacles given by Clodius Albinus as Praetor in the forum and the theatre). Naturally he always won ; according to Dio, he fought publicly with blunt weapons, and, to his own great pride, left-handed, as a *secutor*, against troop masters and gladiators ; and, at a fourteen days' spectacle given shortly before his death, against Aemilius Laetus, the Praefect of the Praetorium, and Eclectus his chamberlain, who were already plotting his death. For every appearance he demanded a million sesterces from the gladiatorial chest. Dio also mentions that the senators (and Dio, as such) publicly had to applaud him, and wish him well.

Even women wore the oppressive vizor and armour and practised the proper strokes against a post, under tuition.

Gladiators were always ladies' favourites. Some of the scrawls on the peristyle columns of a Pompeian house dug out in 1889 mention a Thracian, Celadus, as *suspirium et decus puellarum*, and the *retiarius* Crescens as *dominum et medicum puparum*. Ladies, however highly placed, were attracted by the 'iron' irresistibly, and saw in every gladiator a Hyacinthus. Certainly they were often of heroic mould. Antony, who reminded Cicero of a gladiator, was by others compared to his ancestor Hercules. Nymphidius Sabinus, under Nero Praefect of the Praetorium, was taken to be the son of Martianus the gladiator, of whose fame his mother, a freedwoman, had been enamoured. And Faustina, the consort of Marcus Aurelius, was said to have been intimate with sailors and gladiators at Caieta, and to have been the mother of Commodus by one of the latter. The gladiators were sung by poets, saw their portraits on vases, dishes, lamps, glasses and seal-rings, and their exploits scratched by idlers on walls with coal and nails. In Rome and the provinces artists were incessantly occupied in decorating theatres, tombstones, palaces and temples with sculptures, mosaics and pictures, designed to immortalize, as they actually have, the fame of the combatants.

Hence it is easy to understand that the taste for this bloody pastime was not only widespread, but became a passion. The bold found its very danger an incentive; and they might hope to emerge from a series of combats rich and free. Certainly, some had to content themselves, after their release, as itinerant priests of Bellona; but others hung their arms up in a temple of Hercules, and, like Horace's Veianius, ended their lives on a country estate; and their sons sat in the equestrian seats at the theatre. A Caligula might extravagantly make Thracians captains of his German bodyguard, and one Sabinus a tribune for his bodily strength: but gladiators might easily pass into more honourable employs; even the Emperor Macrinus was rumoured to have been a gladiator. Thus their legal 'infamy' to a certain degree became meaningless; and the association of the upper classes with them helped to diminish the idea of disgrace in their work, thus continuously lowering the barriers between these pariahs and respectable society.

In modern Spain bull-fighting exercises a similar magnetism,

and for the same reasons : it is not labelled infamous and is less dangerous, on the whole. In 1883 it was calculated that every year two or three *matadores* were killed in all Spain ; many retired early, severely wounded, and few attained any great age. More than the high pay recruited their ranks : fame and popular passion for the sport attracted them, though the public was as harsh as the ancient Roman populace and punished any trace of fear with hisses and whistling. Some twenty years later, bull-fights were called by a German observer, Theodor von Bernhardt, ' the only powerful claimant of the attention of the Spanish people ' ; the theatre interesting them but slightly. ' No victorious general, or statesman, ever attains the popularity of a famous bull-fighter '. All Spain knows the arena names of her favourite *toreros* ; and their renown extends beyond Europe ; they appear sometimes in Peru. A severe wound of such a *torero* disturbed all Madrid, more than any political event ; the great ladies call to inquire into his condition ; long rows of carriages defile past his house : and hourly bulletins are at first issued. Often, as in the days of Cervantes, there were noble amateurs of bull-fighting : Mérimée saw a marquis and a count as *matadores* at Seville. Count Schack knew a young *principe* who built a circus in his garden, and practised bull-fighting with young bulls, their horns blunted with wooden balls. In the winter of 1869 there were held dilettante bull-fights of five-year old animals, rendered innocuous in this fashion, and two-year old animals were faced by young ladies and girls in a little enclosed circus.

The enormous number of gladiators required every year in Italy and the provinces made the traffic in them a profitable business. But, whilst no dishonour attached to the noble owners of the troops, who sold and let them out, the profession was in disrepute. Martial expresses surprise that a man who condescended to every shameless course, had no money ; as he was an informer, slandermonger, liar and *lanista* (gladiator-master). *Lanistae* had permanent offices or went about travelling in gladiators, buying them, selling them, letting them to providers of festivals, or giving games at a profit, which was also considered a dirty kind of business. Troops of gladiators were common in Augustus' Rome, for in the dearth from 6-8 A.D. they are expressly mentioned as being expelled, along with other aliens and slave-dealers' families. A copper

inscription was discovered in 1888 near Seville, which sheds new light on gladiators and their contractors. It informs us of a *senatus consultum* of about 177 A.D. under Marcus Aurelius, valid for the whole Empire, excepting Rome, and relieving the burdens of the givers of gladiatorial games in Italy and the provinces. The custom then was to announce in the advertisements of the games the price fixed in advance by the *editores* by the contracts with the *lanistae*. According to price the games were divided into five classes. The lowest (including those given by the *lanistae* and called *assiforanea*) cost 30,000 sesterces, the other classes ranging from 30,000 to 60,000, 60,000 to 100,000, 100,000 to 150,000, and lastly from 150,000 to 200,000, and in excess of this. The *senatus consultum* prescribed the maximum prices for gladiators in the several classes. 'Ordinary' men (*gregarii*), were to be paid for at 1,000 or 2,000 sesterces, and 'better' ones were further subdivided, according to the price, from 3,000 to 15,000 sesterces: 3,000 for the 2nd, 3rd and 4th classes, and 5,000 for the 5th. But at every performance in the first four classes, half of the combatants were to be *gregarii*; should the *lanistae* be unable to furnish the requisite number, 'better' men must be provided at the rate of the *gregarii*. Further, these gradations obtained only for the larger cities, where still higher prices had been the rule; for little towns average prices were to be made out, to be calculated from the last ten years' games. If, besides the prices paid by the providers of the festival to the contractors, prices were stipulated for the victors, the volunteer-gladiators (*auctorati*) were to receive a fourth, and slaves a fifth of their price as prizes. A second regulation designed to relieve the providers of the festivals was the abolition of the heavy poll-tax on the *lanistae*, the cost of which naturally fell on their employer. It had varied, according to the class of spectacle, from a fourth to a third of the stipulated estimate, and brought in an annual revenue of 20 or 30 millions of sesterces (£217,500 to £326,300); thus the annual outlay on those spectacles managed by *lanistae* for the whole empire, excepting Rome, must have been about £1,000,000. A portion of the arrears, amounting to over 50,000,000 sesterces (about £550,000), was to be remitted to the *lanistae*.

As early as 63 B.C. there was a gladiators' school in Rome. Caligula kept a large number of gladiators and also, it seems,

a school ; according to Pliny the Elder, in that school, one Thracian, named Studiosus, had a right hand which was longer than his left ; and of twenty pairs only two did not blink at a brandished weapon. Four great imperial schools are henceforth often mentioned—the Great School, the Gallic, the Dacian, and the school for animal-fighters, round the Flavian amphitheatre ; not newly built (as the *City Chronicle* says) by Domitian, but only enlarged by him. Their departments were multifarious, including armouries, smithies, and mortuaries, and a large staff of instructors, physicians, actuaries and overseers ; and, after Domitian, the Great School and the School for Animal-fighting were managed by procurators of the equestrian order. This post was held as a promotion for retired officers, such as legionary tribunes, civil servants, and the heads of a provincial fiscal department ; and was a step to higher financial posts, such as the administration of death-duties ; even the position of a sub-procurator at an imperial school was very much sought after.

Outside Rome as well there were imperial schools of gladiators, of which three are known, those at Capua, Praeneste and Alexandria, which also had their own administration. The last named was already in existence under Augustus. But, generally, in the provinces imperial gladiators must have been fewer ; often several provinces had only one procurator, as for instance Gaul, Spain, Germany, Britain and Raetia, and again the provinces of Asia Minor and Cyprus. No doubt these officials made circuits in their districts to do necessary business, and especially to select the combatants for Rome ; hence they were in constant communication with the procurators of the capital. In single provinces there must have been sub-procurators to carry on current business. Provincial governors could only levy gladiators and *bestiarii* from their own provinces, and, by a rescript of Severus and Caracalla, could only transport them beyond the provincial boundary by imperial licence.

Criminals condemned to the beasts could not be pardoned by the procurators, and, should the prisoners be 'worthy', for their strength and skill, of being exhibited to the Roman people, had to petition the emperor. In 57 A.D. Nero issued an edict forbidding provincial governors from giving any spectacles (as they had done to win popular favour and silence

malcontents), but whether this remained in force, and for how long, is unknown.

At Rome there was always a considerable number of imperial gladiators. Josephus, speaking of the time after the murder of Caligula, mentions that a large number of gladiators went over into the camp of the Praetorians, and evidently means the imperial gladiators. After Nero's death Otho strengthened his army with 2,000 of them; two centuries later there were 2,000 under Gordian III, whom Philip set fighting to celebrate the millenary of Rome; there were 1,200 in a procession of Gallienus, and in the triumph of Aurelius 1,600. As Italian and provincial imperial gladiators were procurable in any number at short notice, on extraordinary occasions many thousands could be easily supplied.

The plan of the Great School at Rome, engraved on a fragment of the marble plan of the city, of the time of Severus, gives us an idea of the arrangement of these schools; but clearer indications are derived from the gladiators' barracks, restored under Nero on the foundation of a theatre portico at Pompeii, its object being proved by the gladiators' vizors which have been found there. A rectangle, 173 feet by 139, is surrounded by a roofed hall, with seventy Dorian pillars. Besides some rooms of uncertain purpose, there were a large kitchen and a prison, and seventy-one living and sleeping rooms, ten to twelve feet square, without windows, opening on to the hall, and arranged in two floors. Both the pillars and the walls are scrawled over with inscriptions and pictures of gladiatorial life: on the outer wall there is a notice of a coming combat, and two pictures of trophies of gladiatorial weapons are preserved.

To keep troops of criminals and prisoners of war and the scum of the population in check, the utmost precautions were taken. Gladiators were completely disarmed, kept more or less in confinement, and in the imperial schools guarded by soldiers. Spartacus and his associates escaped from the school at Capua, overpowered the guard, armed themselves with swords, which they seized in Capua, sticks, travellers' daggers, and weapons forged by themselves. Seneca and Symmachus mention occasional suicides in these schools; the suicides had to evade the guard, and commit the act without weapons. In 64 A.D. an attempted escape at Praeneste was foiled by the

vigilance of the guards. The discipline was of the severest, as the oath proves. The punishments were scourging, branding and confinement in chains. The prison of the Pompeian school was so low that the captives could only sit or lie down ; leg-irons for ten prisoners and four skeletons have been found at Pompeii.

Only in one respect did gladiators fare better than condemned criminals ; their bodily well-being was a matter of anxious thought. A healthy locality was always chosen for the schools : such as Capua with its ideal climate, Praeneste with its pure mountain air, Ravenna and Alexandria, where the sea-breezes tempered the heat. The food given was designed to develop muscle ; barley was used for this purpose : hence the men were nicknamed *hordearii*. Galen says that the gladiators he treated at Pergamus ate beans and barley every day, which made their flesh loose and not, as was desired, firm. Juvenal's 'mess' (*miscellanea*) of the gladiatorial school, which the spendthrift will have to put up with, shows that gladiators' food was generally considered bad. Their meals were prescribed in quality and quantity ; they 'ate and drank what they were to return in blood'. Distinguished surgeons healed their wounds, and some of their prescriptions have been preserved by Scribonius Largus ; physicians were in attendance to see to their diet being strictly kept : *unclores*, a special class of slaves, looked after their massage, which was highly esteemed in ancient times.

To encourage a common worship of patron-gods, and perhaps for other reasons as well, gladiators and other imperial slaves were allowed to form guilds. Thus, according to an inscription of 177, a number of Commodus' gladiators formed a guild which worshipped Silvanus. At Dea (Die) the 'huntsmen who serve in the arena' (i.e. the *bestiarii* in the amphitheatre) form a union, and thus, too, elsewhere. The special kinds of combatants also combined. Thus one Thracian has a grave erected to him by the whole guild (*armatura*) of the Thracians, and a *secutor* by a brother-in-arms (*coarmio*) ; but there were also in the same schools friendly relations between the several sets. The grave of a *retiarius* of the Great School at Rome was put up by a *myrmillo* of the same school, his messmate (*convictor*).

Each class had its special instructor. Novices practised

with wooden swords at a man of straw or a post : the weapons used in more adept practice were heavier than those used in the arena ; possibly the very weighty ones found at Pompeii were for practice. The fencing of the gladiators was a science, and its technical expressions generally understood. Quintilian compares the speeches of counsel with the fencing of gladiators : ' the second stroke becomes the third, if the first be made to make the opponent thrust ; or becomes the fourth, if there be a double feint, so that there are two bouts of parrying and riposte '. The words of command (*dictata*) used by the instructors were shouted out to the antagonists in the arena by the public, and these hints were sometimes of service even to the best-trained gladiators. In 105 B.C. the consul Publius Rutilius had an instructor from the schools to teach the legionaries the ' finer art of parrying and thrusting '. Left-handed fighting was especially valued ; Commodus distinguished himself in it.

The schools had a sort of military organization. Fine titles were generously distributed, and the names of the famous combatants of old revived. Success entitled gladiators to rise, perhaps to some position of command over their fellows, and thus they became veterans. In the Guild of Silvanus the first *decurio* consisted of veterans in six kinds of weapons, the second was commanded by a veteran, and the third were mostly tiros. At the end they received the wooden sword of dismissal ; but, after release, they often would fight for a good fee, or act as instructors.

Very many of them would not have exchanged their lot. Many of the imperial gladiators, says Epictetus, are indignant if not allowed to appear. They pray the gods, and beset the procurator, for permission to fight. Tiberius gave but few games, and Seneca heard a *myrmillo* complain of the days passing profitless. They were animated by a certain feeling of honour ; they would not fight except with their equals ; and a wild bravery, born of the certainty that love of life made their spectators merciless, rendered them contemptuous of death. Without a groan they would bear the severest wound ; when their blood was draining away they asked their master, should they desist or perish : the most cowardly learnt how to die.

Gladiators were sometimes used in civil wars and fought

with the utmost courage, and the utmost devotion to those who fattened them for the arena. After the battle of Actium, Antony's lost cause was deserted by great and small, and only the gladiators whom he had practised at Cyzicus for his anticipated victory remained true to him. Of their own free will, they marched off to join him in Egypt ; nothing could restrain them ; finding that they could not force a passage, they sent a message to Antony to come to Syria, and only abandoned him when he neither came nor replied. Lucius Antonius and Decimus Brutus also recruited from gladiators. Otho enlisted two thousand ; ' a shameful expedient, which in the Civil War was not disdained by the sternest generals ', says Tacitus ; but they were not as trustworthy as the soldiers. Out of Vitellius' gladiators who were surprised at Terracina, only a few stood their ground. Marcus Aurelius, in the pressure of the war with the Marcomanni, armed even slaves, and formed a corps of gladiators, whom he called the Obedient (*obsequentes*). Didius Julianus, also, at Severus' approach armed the gladiators of Capua.

In these troops of despised and brutalized men the fate of those who had seen better days was doubly miserable. In the rhetorical essay on the youth who enlists in the gladiators to be able to bury his father, he is described as ' standing in a slave's costume, and expecting a shameful death, and seeing the pictures of his happier past ; thinking of all that he will never again see, his house and family and friends ; and that once he ranked, as a man of family, wealth and education above the giver of the spectacle '. And woe to him whom, in the company of vulgarity, vice and misery, such recollections overcame ! His life was sheer torture, and death the only happiness he desired. The strictest watch over him was in vain ; suicide became only the more heroic. Though such incidents are only occasionally related, it does not follow that they were rare. What barbarities might go on in those torture-chambers the incident of Lucius Balbus and Fadius illustrates. Seneca tells in the last year of Nero of two recent heroic suicides of *bestiarii*. One of them, in the early morning, was being drawn on a chariot between two soldiers to the arena. He pretended to be overcome by sleep, let his head droop between the spokes of the wheel, and waited until his neck was broken. Mutinies, conspiracies and revolts were frequent in

these schools, although another Spartacus never arose. In 64 A.D. an attempt of the gladiators at Praeneste to escape caused grave anxiety at Rome, and was suppressed by the garrison on the spot. Under Probus eighty gladiators in Rome itself succeeded in escaping, and were only overcome after a brave resistance. A letter of Symmachus mentions one incident yet more frightful. Some of the brave Saxons, who adventured in little boats from the Baltic into the ocean, and ravaged the coasts of Gaul, had been captured by the Romans. A number of them were to appear in Symmachus' Games. On the first day twenty-nine of them had strangled one another with their bare hands.

The gladiatorial games were announced by advertisements, painted by order of the organizers of the festival on the walls of buildings public and private, and on the grave stones which lined the main roads leading into the towns : they were the work of a special class of scribes who used colours, and these men were sometimes begged on the tomb-stones not to profane the last resting-place. On two such stones outside the Porta Nuceria of Pompeii, notices were found of amphitheatrical games at Nola and Nuceria. Of the Pompeian games some announcements have been found elsewhere, e.g. : ' thirty pairs of gladiators belonging to the *quinquennalis*, Gnaeus Alleius Nigidius Maius, and their understudies (to replace the dead) will fight in Pompeii from the 24th to the 26th November. There will also be baitings of animals. Long live the *Quinquennalis* ! ' Or again, ' The family of gladiators belonging to the Aedile Aulus Suetlius Certus will fight at Pompeii on the 31st May. There will also be baitings of animals, and an awning will be provided '. Often, too, besides the awnings, sprinkling with water to lay the dust and cool the air were promised. Or, instead of a date ' if the weather allow ' or ' without any delay ! ' Often too the names of the principal performers were arranged in pairs, in order of combat, and the organizers, to keep the people excited, used to add new pairs every day : then lists were copied out, sold in the streets and exported.

On the eve of the spectacle, the fighters of animals and men were given a so-called ' free banquet ' with every luxury : the curious might enter and look on. The rougher and brutalized ate and drank with no thought for the morrow, but many took

sad leave from their children and wives, whom they commended to the care of their friends, manumitted their slaves, and the Christians, who were to fight for their faith in the arena, held a last ἀγών.

The spectacle began with a parade of the gladiators in full uniform through the arena, possibly to the cry, once mentioned by Suetonius, of ' Ave, Imperator, morituri te salutant '. Novices apparently at their first appearance had to run the gauntlet, a frequent feature of the amphitheatre often mentioned in Christian martyrologies. The giver of the festival was then invited to examine the weapons. One special brand of gladiators' swords was named after Tiberius' son Drusus ; they were sharpened to excess ; Drusus was naturally cruel and careless of life. Domitian also made regulations to make the combats yet more severe. In 93 Martial is glad to be able to say that the good old customs of the Roman arena had been revived, and courage was exercised in simpler combats. But Marcus Aurelius enjoined the use of blunted weapons.

The first scene consisted of mock-fights, in which lances were thrown, sometimes to music. The sombre *tubae* announced the first fight with sharp weapons, which began to the sound of horns and trumpets and the shriller pipes and flutes. The most varied episodes now succeeded one another : *retiarii*, half-naked, almost armourless, mobile figures with net, trident and dagger, pursued by *secutores* in vizor, shield and sword ; hovering round the *myrmillones*, half-cowering under them, they sought to entangle their antagonists in the net, and kill them with trident or dagger. Or the Samnites with their huge square shields, that covered their whole persons, met with their short straight swords, the scimitars of the Thracians, who had heavier armour, but little round shields. Cavalry fought with long spears, the *essedarii* on British war-chariots, the horses of which were managed by a man standing beside the combatants. Other species of gladiators are occasionally mentioned, but very vaguely.

When one duellist was struck, the universal cry rang out : *habet*. The provider of the festival had the right of decision, but generally consigned the fallen to the mercy of the spectators. The wounded (according to a Greek custom) laid their shield down and lifted up, in sign of prayer for life, one finger of the left hand. The spectators signified mercy by waving

handkerchiefs or lifting their thumbs : turning the thumb down meant death. Brave gladiators often rejected popular interference, and made signs that their wounds were slight, and they could still go on : such met with pity ; the faint-hearted aroused the anger of the populace, who thought it an insult a gladiator should not be willing to die. The cowards were driven in with whips and hot irons to fight. The inflamed spectators shouted : ' Whip him on, kill him, burn him ! Why does he fear the sword ? why is he giving the death-strokes so unwillingly ? Why does he die so sullenly ? ' Spectacles used to be given in which the *missio* of wounded fighters was forbidden, and the combat was to the end, until Augustus forbade them, and publicly censured in an edict the cruelty of Nero's father, Gnaeus Domitius, after a confidential warning had failed. Very often, too, the victor had to fight an under-study immediately after. In the intervals the blood-drenched ground was shovelled up by boys and Moorish slaves sprinkled fresh sand. The victors brandished their palms, and the fallen were taken by men garbed as Mercury, the god of the nether world ; others, wearing the mask of the Etruscan daemon Charon, probed them with hot irons, to see if they were shamming death. Hearses stood ready in anticipation, and on them they were borne through the gate of the Goddess of Death into the mortuary. Any who still showed signs of life were killed.

Factions were formed in the amphitheatre, but never to the same extent as in the Circus. For the passion found its full exercise there, and there were no corporate organizations. But besides devotees of famous gladiators, the amphitheatre formed parties for the various kinds of combatants : for the *myrmillones* and Samnites, who bore large shields, and the Thracians, with their small shields. These factions permeated the whole of society, including even the emperors : to the former Domitian adhered, and Caligula and Titus to the latter ; hence Martial speaks of the Thracians, who seldom won, and their adherents with some contempt. Domitian was present, when one spectator remarked that a Thracian who had fallen could have stood up against his antagonist, but not against the arbitrary giver of the spectacles : the emperor had him hauled out into the arena and thrown to the dogs, with a label on his neck, ' an adherent of the Thracians who has spoken im-

piously'. In consequence of similar incidents, Pliny the Younger says that Trajan restored liberty of party and applause to the spectators. 'No one is now accused of *impietas* for hating a gladiator, or on that account himself made a part of the spectacle, by suffering a martyr's death for his unfortunate whim. The man who collected material for treason in the arena, thought himself despised if his fighters were not honoured, deemed insults to them an insult to his divinity, and considered the gods, himself and his gladiators identical—that man must have been mad, and ignorant of true honour'. Marcus Aurelius congratulates himself on impartiality between the two shields in the arena, and between the two colours in the circus. Yet great import attached to these factions: the inscription of a slave oil-dealer, Crescens, says he had been a Blue in the Circus and a Thracian in the amphitheatre.

Great *battues* were hardly possible in the amphitheatre, and were very occasionally given in other places. Julius Caesar, at his triumph, had a battle performed in the Circus, the boundary columns removed, and two camps thrown up; five hundred fought on either side, three hundred infantry and twenty elephants, with garrisoned towers on their backs. In 7 B.C., in honour of Agrippa who died in 12 B.C., a battle was performed in the *saepta* he had built. After the conquest of Britain in 44 A.D., Claudius had a realistic representation of the capture and sacking of a British town and the surrender of the princes performed on the Campus Martius, presided over by himself in a general's mantle. A smaller fight between two equal troops of infantry was given by Nero in 57 A.D., in the amphitheatre; and larger combats of cavalry and infantry by Domitian in his triumphal games in the Circus.

(2) ANIMAL-BAITING

(a). Marcus Fulvius Nobilior, the conqueror of Aetolia in 186 B.C., gave the first known exhibition of animals at Rome. This was eighty years after the introduction of gladiatorial games, though to be torn asunder by wild beasts had been a form of sentence of death. Thenceforth this spectacle, which took place under the Republic in the great Circus, as occasionally later, became frequent, and more and more splendid. The animals were simply exhibited, or also hunted and killed by

men or other animals. The men who fought them were not only condemned criminals and prisoners of war, but also hirelings ; Seneca makes his bankrupt spendthrift undecided whether to become a gladiator or a *bestiarius*. This profession shared the dishonour and the glamour of gladiature. Men thronged to it, says Tertullian, and prided themselves on scars and bites, as beauty-marks : and Ulpian mentions unpaid volunteers, who fought for sheer bravery's sake. There were families of *bestiarii* as of gladiators, trained in special schools : we may compare Ferdinand VII's Royal School of Tauromachy, founded at Seville in 1830. One of Domitian's four imperial schools was almost entirely given up to the training of *bestiarii*. If animal shows were given along with other games, they generally preceded, and began in the early morning. According to Suetonius, Claudius enjoyed these fights of criminals with wild beasts and hurried to the spot in good time before day-break.

As the empire expanded, these games were given on a larger scale. The subduing of the African domains of Carthage preceded their introduction ; forty years later Carthage became a province. The wild creatures of this region were the only non-European ones seen for over a century in the Circus. At that first exhibition, lions and panthers were as plentiful, in Livy's estimate, as in Augustus' time ; and seventeen years later, 189 B.C., the Circus *venationes* of Scipio Nasica and Publius Lentulus, evidenced the 'growing splendour' ; there were sixty-three African animals (panthers, leopards and possibly hyaenas), forty bears and several elephants. Plautus even had seen ostriches flitting across the Circus. Besides these foreign animals, deer, hares and stags, boars, bears and bulls from the woods of Apulia and Lucania, the Pontine Marshes and the Apennines were hunted in the Circus and often, probably, only these native animals ; and at the Feast of Flora, annual after 183 B.C., only harmless animals.

The spectacles of the last century of the Republic bear testimony to the worldwide extent of the Empire. Between 58-46 B.C. three *venationes* of unparalleled splendour were given in succession, at which animals were paraded, whose very names were scarce known at Rome, and most difficult of capture : such as, in 58, crocodiles and hippopotami from the Nile at the festival given by Scaurus ; the rhinoceros, the lynx,

and a species of African ape, never again seen, at the five days' *venatio* at Pompey's dedication of his theatre ; and the giraffe at the five days' festival given by Caesar at his triumph in 46 B.C. These rare and costly animals were often seen in Rome afterwards in large numbers, and even killed ; Cassius Dio saw Commodus kill on one day five *hippopotami*, and on two other days two elephants, a giraffe and some rhinoceroses. Varro had thought tigers an impossible capture, but in 11 B.C. and frequently afterwards they were seen both tame and wild.

In ancient Rome such animals were often seen ; in mediæval and modern Rome even the sight of less rare beasts roused a great excitement. Charlemagne in 801, through his ambassador, Isaac the Jew, received an elephant and an ape from Harun al Rashid, and a Numidian bear and Moorish lion from an African Emir. These facts are recorded in the biography of Charlemagne by the monk of St. Gall, and by Eginhard in his annals ; the latter also tells of an elephant's voyage and sudden death in the Münster country. Henry I had lions, leopards, lynxes and camels at Woodstock. The easy transport from the Southern and Eastern Mediterranean and the warm climate made it all the easier to buy Southern animals, or receive them as gifts from Sultans. The Emperor Frederick II had in his gardens camels, lions, tigers, leopards, and one giraffe, a present from the Sultan of Egypt, which Albertus Magnus saw and described. Frederick used to take rare animals with him on his travels and campaigns ; at his entry into Cremona in 1237 an elephant drew the *carroccio*. On great occasions the animals were set to fight each other or dogs, to amuse the people. And towns and princes took pride in keeping living lions, who also were useful as public executioners : Florence used leopards for this purpose comparatively early (in 1291).

Towards the close of the fifteenth century several of the princely courts of Italy regularly possessed real menageries (*serragli*) ; the one at Naples under Ferrante contained a giraffe and a zebra. In 1459 a giraffe was seen at Florence, and, when Kayt Bey, Sultan of the Mamelukes, presented a second one to Lorenzo il Magnifico, Antonio Costanzio described it in 1487, and Politian collated all the ancient authorities on this remarkable animal. Johannes Schiltberger of Munich calls it *urnasa*, and saw one about 1400 at Dily (Delhi), and Felix

Fabri, the preaching monk of Ulm, another at Cairo. Buffon had to be content with travellers' descriptions. It was not brought to France from Alexandria before 1826. According to Thibaut's account, who was the first to capture giraffes alive on the steppes of Cordofan, the young are caught, after killing the mothers; the enterprise is incredibly difficult. For whole weeks the huntsman must remain on the steppes, take with him the best horses, camels and cows, and have as guides native Arabs; otherwise nothing can be done: the cows are needed to feed the young animals. From the interior of Africa, they and the cows are brought by short stages to the coast, and thence transhipped in special cages.

On May, 1, 1513, a live rhinoceros was brought to King Emanuel of Portugal from India, and Sebastian Münster thought fit to mention the event in his *Cosmography*. Albrecht Dürer has left us an imperfect reproduction of this first rhinoceros, afterwards often copied; Chardin (who died in 1713) saw one at Ispahan, and about 1700 gave a better description; but in 1664 and 1689 rhinoceroses were seen in London, as also later, e.g., 1739 and 1741; the rhinoceros of 1741 was also shown in Germany, as mentioned in Gillert's well-known tale, and is entitled in a copper-plate the Behemoth (Job xl. 10). In 1793 one arrived at Paris, and in 1816 another in Germany.

But no hippopotamus was seen in Europe after Roman days, before the one brought to the London Zoological Gardens on May 25, 1850. The British consul at Cairo had to exert all the pressure at his command to induce the Pasha of Egypt to make this costly present. A whole division was occupied in capturing it; its transport from the White Nile to Cairo took five or six months; on November 14, 1849, it reached Cairo, and wintered there. From Alexandria it was forwarded in a steamer specially constructed with a freshwater tank containing 400 gallons, and daily renewed; whilst two cows and ten goats barely satisfied its requirements of milk. These facts serve to illustrate the colossal outlay for the lavish arena of the Roman Empire.

Yet, besides the huge numbers, there was a huge variety brought together at the great *venationes*. It must be remembered that, according to Dio, there was much exaggeration, and further, that in two thousand years many species have almost become extinct; yet, even half would constitute an

enormous number. But no subsequent exhibitions were ever on the scale of those of Pompey and Caesar. At Pompey's games there were, as recorded, 17 or 18 elephants, 500 or 600 lions, 410 other African animals; and at Caesar's 400 lions and 40 elephants. But the exhibition of hundreds of lions and bears and African animals at spectacles, not to speak of larger numbers of commoner animals, was, according to the imperial historians, by no means rare. According to Augustus' own statement, who took especial delight in 'untold numbers and unknown shapes of beasts', 500 African animals alone were laid low in the spectacles he provided. At the hundred days' festival given by Titus at the dedication of the Flavian amphitheatre in 80 A.D., on one day 5,000 wild animals of various sorts were exhibited, and 9,000 tame and wild was the sum total of the killed, and, at the four months' festival of Trajan in 107 A.D. at the second Dacian triumph, 11,000.

The animals, consumed at Rome for one great festival, would amply stock all the Zoological Gardens of modern Europe. Science also profited of this profusion. According to Galen, physicians assembled at the dissection of a large elephant; the heart was taken out by the imperial cooks. Drugs were also concocted out of the parts of wild animals. Artists also studied their shapes; the famous sculptor, Pasitales, a contemporary of Pompey, was one day modelling a lion in one cage, when a panther escaped out of an adjoining cage, and he barely escaped with his life.

But *venationes* were also given, throughout the empire, in the minor towns, and the demand for wild animals must have necessitated incessant hunts within and without the empire, to provide them for the emperors and private individuals, whether providers of festivals or merchants. These hunts went on for centuries, and the parents had to be killed, in order to capture the whelps; hence, the animal kingdom became wholly transformed, wild animals extirpated and driven into wildernesses, and new ground gained for civilization and agriculture.

Even in Strabo's time the ground between Carthage and the Columns of Hercules had been so far extirpated that the nomads could turn to agriculture; and could defend themselves against them, partly because they were proficient hunters, and the Roman passion for *venationes* supported them.

'Oh distant Nasamonian Lands of the Libyans', says a Greek poet, 'your barren plains are no longer visited by flocks of beasts of prey, you no longer tremble at the lion's roaring in the desert; for Caesar has caught a vast number of them, in nets, for one single exhibition, and the former lofty lairs of wild beasts are now pasturages'.

Thus, too, the needs of the Roman amphitheatre relieved the cornfields of Egypt from the ravages of the hippopotami, which were common in Pliny's time above the Praefecture of Sais, and, in the fourth century, had been banished to the upper reaches of Nubia. A writer of the fourth century regrets that there are no more elephants in Libya, or lions in Thessaly, or hippopotami in the swamps of the Nile. Now hippopotami are no longer found even in Nubia, and occur commonly only in the Eastern Sudan and the heart of Africa.

Thus, in antiquity, the hunting-ground in Africa became exhausted; but Asia was still prolific in wild animals, with which the kings and satraps of Persia reinforced their menageries, and supplied those of the Roman Emperors of the fourth century, who laid out their own after the same model. Even in Ammianus' times in the reeds and jungles of Mesopotamia there were 'countless' lions, and in Hyrcania swarms of tigers and other wild animals. At the frontiers of the empire, there was an import tax on all Asiatic products, as on animals intended for spectacles, such as 'Indian (i.e. Asiatic) lions, pards, leopards and panthers'. Symmachus calculates the harbour-tolls on beasts at $2\frac{1}{2}$ per cent., from which senatorial givers of festivals were exempted.

Sporting rights were by Roman law included in the rights of property, for the owner could exclude; but the *jus gentium* made the huntsman the owner of an animal, wherever it fell. But elephants could only belong to the emperors; Aurelian, after the fall of the Republic, was the first private individual to have one of these 'imperial cattle which no subject might own', and this was taken as a fore-token of his sovereignty. Elephants might not be hunted without imperial licence, and lions also, at any rate, in the later Empire. In an Edict of Honorius and Theodosius of 414 A.D., 'a man who kills a lion need not fear indictment, as our subjects' safety must prevail over our pleasure; but, our pleasure still forbids the hunting and selling of lions, though not their killing'. In 271 A.D.

the Marcomanni were invading Italy, and Aurelian offered to supply the Senate with 'royal animals' should the Sibylline books ordain their propitiatory sacrifice; these must have been lions and elephants. There was a special procurator for the department of the imperial elephants.

The wealth of the imperial menageries and gardens in the rarest and most costly animals may be estimated from the catalogue of those at Rome under Gordian III: 32 elephants, 10 elks, 10 tigers, 60 tame lions, 30 tame leopards, 10 hyaenas, 1 rhinoceros, 1 hippopotamus, 10 'arcoleontes (? archileontes)', 10 giraffes, 20 wild asses, 40 wild horses, and countless other animals, all of which Philip devoted to the millenary celebrations of 248 A.D. The administration and upkeep of these menageries involved a large staff, and a large annual outlay: once, when meat was dear, Caligula fed them with criminals; Aurelian sold those used at his triumph to save the fisc the cost of their keep. Besides the imperial menageries (for which purpose the extensive vaults of the Church of San Giovanni e Paolo may in part have served) there were others in Rome. In the third century the Praetorian and City cohorts owned a menagerie, possibly the *vivarium* mentioned by Procopius, near the Praenestine Gate (*porta maggiore*) just outside the wall, near the *amphitheatrum castrense*, which also belonged to them. In the imperial gardens animals may also have been kept, as, for instance, in a park by Nero's Golden House.

Probably the emperors often gave their friends and privileged senators animals for amphitheatrical shows. Symmachus received for his son's Praetorian Games from Honorius, at Stilicho's request, a gift of several leopards. Further, Roman grandees generally owned land in Africa and Asia, and could utilize the friendship of the provincial governors, and thus expedite the importation of animals; but the Republican practice of making contributions of money and wild animals to the spectacles of the procurator's friends a permanent tax on the provincials, had fallen into disuse. The higher Roman officials had come to regard the supplying of wild animals as a trifling and matter-of-course act of friendliness on the part of the provincial procurator, as Cicero's letters when proconsul in Cilicia in 51 B.C. from Marcus Caelius the aedile show. 'Patiscus', Caelius writes, 'has sent Curio ten panthers; it would be a

shame, should Cicero not send more ; he need only issue the commission ; food and transport had been provided '. As a return-favour was exceedingly probable, such requests were not lightly refused.

Thus, thousands of brave huntsmen, year in, year out, ran dangers in every zone, to furnish the demand of the amphitheatre for animals. For one great Roman festival, with due Roman splendour, the Hindu tamed elephants to catch elephants, the Rhinelanders spread nets over the boars in the reeds, Moors on their hardy ponies encircled ostriches in the deserts, and lurked in the horrible solitudes of the Atlas by the lion-pits. Should these perilous ventures succeed, devices for transport called a new industry into being. The axe rang and the saw grated, the anvil grew hot ; and at last the terrible captives vented their rage on the bars of their cages. Claudian in his poem on Stilicho describes a *venatio* given by him. To honour his patron, Diana and all her nymphs hunted in the forests, the wildernesses and the hills of the world, the carpenters had not wood enough to make even all the beams ; and cages had to be made, with box and elm wood still green, and the leaves visible.

Transport was effected mostly by sea, and storms might delay or wreck : there were at the wharves of the Campus Martius in the late Republic cages for the temporary safeguarding of animals. But long trains of heavy ox-wagons loaded with cages also came by land. The huge distances often necessitated voyages of many months, in which the animals might succumb to death or disease. An Edict of Honorius and Theodosius obliges towns through which imperial transports of animals passed to provide for their provision ; probably this only regularized pre-existing practice. This decision led to great abuses, for an edict was issued by these two emperors that no such stay should exceed seven days, for one such train dallied in Hierapolis, the capital of the province of the Euphrates, for three to four months, and the conductors, contrary to all precedent, required cages as well to be supplied.

(b). In the amphitheatre the animals were hunted, made to fight one another, and let loose on men ; but some few harmless and rarer sorts were only paraded. They used to be decorated, as though for a sacrifice or procession. At the celebration of the *decennalia* in 263 two hundred tamed animals, variously

bedecked, led the way to the Capitol, and 200 white bulls for the altar with gilded horns, and broad coverlets of coloured silk on their backs, followed by Gallienus himself : and pictures of sacrificial and amphitheatrical animals are preserved, showing them decorated in this fashion. Seneca prefers the lion, terrible in his natural beauty, to one with gilded mane and glittering with plate of gold. Lucilius and Juvenal speak of white-washed bulls brought up to the Capitol, and Pliny of sheep with purple and scarlet fleeces. At the sixth of the twelve performances given by Gordian I as Aedile at Rome, there were 300 ostriches tinged with vermilion, which were, with the rest, abandoned to the people.

The number of the tamed animals in the amphitheatre is as astounding as the skill of their trainers. Plutarch, writing under Vespasian, says that the imperial games of Rome amply exemplified animal intelligence and docility. Under Augustus even, animal-training had so far become a regular profession (practised in Alexandria more than elsewhere), that Manilius ascribed luck in it to one particular constellation. Julius Caesar was escorted home by elephant torch-bearers, and Marcus Aurelius and Cytheris the dancer drove in a chariot drawn by a team of lions. Lions, panthers, bears, boars, wolves, tame and wild, were kept in the palaces of the emperors and nobles. Performing apes who acted plays, drove in chariots, rode on dogs, served to amuse the rabble. Ancient tamers aimed at training animals in directions contrary to their nature. Wild bulls let boys dance on their backs, reared, or, together with horses, performed tricks in water, and, like charioteers, remained motionless in swift two-horsed cars. Stags were bridled, and pards yoked ; cranes circled, and fought each other singly. Unwarlike antelopes butted at one another to the death. Sea-lions were trained to greet the people by looking at them, and barked in answer to their names. Lions were as obedient as any dog ; in Domitian's spectacle they were set to catch hares in the arena, carry them back to their master in their teeth and let them loose anew. At the command of their dusky teachers elephants knelt, danced to the tune of the cymbals banged by a brother elephant, sat down to table ; or four would carry a fifth in a litter like a woman in childbirth ; or they would walk a rope and write Greek and Latin. Pliny asserts that one of a troop which was

being trained was a slow learner, and hence was often beaten ; but could be heard by night practising his lessons. The Romans were tender of elephants, and found something human in their docility. At Pompey's games a large number were killed, and the people were indignant and almost turned against Pompey.

And with the exhibitions of performing animals there alternated fights of wild ones : a rhinoceros and an elephant, a bear or a bull, an elephant and a bull and so forth. Natural savagery was artificially heightened. They were driven in to the sound of whips, pricked, hot irons applied, dolls of straw thrown in front of them, which they angrily tossed, or tied together with long ropes, and the people exulted at seeing them rend each other's flesh. Similar, or greater barbarities have excited the popular passion of modern days, e.g., the *Hetzhaus* at Vienna, or at Madrid in 1853 the fight of the bull *Señorito* with a tiger, when the bull survived.

Also in the Roman amphitheatre, skilled and armed huntsmen with high-class hounds stepped in to fight the savage animals. The hounds were got from the greatest distances ; in Strabo's time, from Britain, then famous for sporting-dogs, which the Gauls used, besides their own, in war even. Symmachus, for his son's quaestorian games, received seven Scottish hounds from Flavianus, which excited the admiration of Rome : it was said they had been brought in iron cages. The hounds were trained for the hunts : Martial says of a bitch Lydia, belonging to Dexter, that she had been educated by the masters of the amphitheatre. Wearied by the harassing dogs, lions, panthers, bears and bisons fell before the arrows and javelins, in which last Moors and Parthians were especially proficient. Bears were sometimes seen killed by a fortunate blow on the skull, lions blinded by a cloak, and thus easily killed. Carpophorus, a huntsman celebrated by Martial, had laid low twenty savage animals at one exhibition ; had he lived earlier, the poet says, his fame as an exterminator of monsters would have exceeded that of Hercules and all the heroes put together. Bull-fights were popular in Greece and native in Thessaly : under the Empire they were a favourite pastime at Eleusis, Athens, Pergamus, Miletus, Smyrna and Lesbos ; and, after Caesar's introduction of them, they were frequent at Rome : the wild animals were irritated with red rags, and

faced by matadors on foot, on horseback, who, after the Thesalian custom, wearied them out, and then dragged them down by their horns. Claudius made a division of the mounted Praetorians under their officers fight African panthers, and Nero made them fight 400 bears and 300 lions.

But another of the spectacles of the amphitheatre consisted in those frightful executions of men tied to stakes and defenceless, or—to prolong their torture—insufficiently armed and delivered to beasts, who were sometimes specially trained for the work. The victims with limbs torn asunder and covered with blood were seen begging, not for mercy, but delay of death till the morrow. Or their wounds were so huge that curious physicians had an opportunity (e.g. Celsus on Galen's authority) of seeing the interior of the body. And these scenes of horror were episodes on a stage, possibly to lessen the gruesomeness: but modern feeling is doubly shocked at mechanics and artists being called in to set off and prolong the agonies of the delinquents.

Strabo mentions one of these spectacular executions. Selurus, a robber, called the son of Etna, as he had practised his trade there, had been condemned to death by the beasts: a scaffold was erected on the forum, on which he stood, and foundered, dropping Selurus into the cage, where he was soon devoured. The Flavian Amphitheatre provided most amply for a full theatrical outfit of devices and scenery for the sights. A building near the Colosseum, erected, it may be, by Domitian, contained all the properties for imperial spectacles, and the administration of this *summum choragium* was entrusted to a procurator, who was also possibly appointed by Domitian, a freedman, ranking, however, with the procurators of the smaller provinces. As at Puteoli and Capua (where the amphitheatres were perhaps used for imperial spectacles), the Colosseum was built on huge substructures, twenty-one feet below the present level. Into these underground chambers men, animals and machines could be conveyed unnoticed from the *choragium* by outside entrances, and at the Capuan amphitheatre, which is almost as large as the Flavian, there was room for a thousand men. Apollodorus, the architect, proposed to Hadrian to connect the substructures of his temple of Venus and Rome with those of the amphitheatre, to allow more space for the properties. Thus the whole scenery, and all the actors

and animals, could be suddenly shifted, raised, lowered or made to disappear in the most surprising manner. Roman mechanicians attained very great skill, and could easily lift their scaffoldings and ante-rooms into the air noiselessly, break them up and close them together again. At Severus' games in 202 the arena was transformed into a ship, which all at once broke up, and discovered a mass of the most various animals, bears, lions, panthers, ostriches, and bisons, who instantly assailed one another : during the seven days 700 animals were exhibited and killed. At Nero's performance, described by the poet Calpurnius, the ground repeatedly yawned open, and a magic wood of glittering bushes with fragrant fountains sprang into view, immediately to be inhabited by monsters of foreign climes, who emerged from the depths.

Theatrical and pantomimic performances also took place in the arena ; only the actors were condemned criminals, who were practised in real and not illusionary torture. They appeared in precious tunics embroidered with gold and purple mantles with golden crowns ; but, like the fatal gifts of Medea, these garments too suddenly burst into flame and consumed their unhappy wearers. Such inflammable stuffs were called by the populace *tunica molesta*, and, when in 64 A.D. the Christians were condemned to death for alleged complicity in burning Rome, they were tarred and resined, and used as torches at night, or wrapt in hides and torn by dogs. Tertullian says men even hired themselves out to run a certain distance in a burning tunic. Perhaps there was no single torture or cruel death known to history or literature, not used to divert the Roman amphitheatre. ' There ', says Tertullian, ' we have seen the castration of Atys, and a man burnt alive to represent Hercules' living pyre on Mount Oeta ' : a Greek epigram records a thief being burnt in this tragic fashion. Martial saw one culprit hold his hand over burning coals to represent Mucius Scaevola, till it was consumed ; and a robber Laureolus, the hero of a well-known farce, was crucified and torn asunder by animals. He describes how the limbs slowly dropped off, and the body became shapeless, and consoles himself with the reflection that the sufferer must have been a patricide, a robber of temples, or guilty of arson and murder. And, at the same spectacle, another criminal appeared as Orpheus from the depths, re-emerging from Hades. Nature was enchanted by

his playing, rocks and trees moved to greet him, birds hovered over him and animals crouched at his feet, and, after the spectacle had lasted long enough, he was torn to pieces by a bear.

Besides mythology thus heinously interpreted, there were indecent scenes ; Europa or Pasiphae and the bull. Boys, as Cupids, flew up to the awning. And mythology was improved on : Daedalus was devoured by a bear, a Hercules borne up to Heaven on a bull. And then the arena became a lake, in which Leander swam to meet Hero, Nereids assembled in charming groups, and stars shone over the heads of the Dioscuri.

(3) THE NAUMACHIAE

Naval fights were also improvised on the flooded arena. As early as 57 or 58 A.D. the amphitheatre built by Nero on the Campus Martius was flooded, fish and larger marine animals set swimming there, and a naval battle between the Athenians and Persians performed, after which the water was let off and gladiatorial combats and a land-fight given on the plain. At a festival in 64 A.D. a battle by land followed one by sea on the same arena, which was again flooded, and a luxurious feast given on the water. The huge cisterns and pipes, by which the arena of the Flavian amphitheatre could be turned into a lake, were ready in 80 A.D., as Titus at the dedication games gave naval performances and a naumachy between Corcyraeans and Corinthians. Domitian also gave a naval battle in the amphitheatre.

But the first naval battle on a large scale was instituted by Julius Caesar at his triumphal games in 46 B.C. He had a lake dug out on the Campus Martius, on which a Tyrian and Egyptian fleet fought against each other. Each consisted of biremes, triremes and quadriremes, with 1,000 marines and 2,000 oarsmen. In 43 the lake was filled in, to prevent an epidemic arising from the exhalations. In 2 B.C., at the dedication of the temple of Mars Ultor Augustus gave a second great naumachy in a lake dug out on the further bank of the Tiber, probably in Caesar's gardens : according to his own account, it was 1,800 feet long and 1,200 broad : thirty biremes and triremes with beaks, and a larger number of smaller ones, armed with 6,000 soldiers, without reckoning in the rowers, performed a sea-fight between Athenians and Persians.

But both of these naumachies, as all subsequent ones, were surpassed by the one with which in 52 A.D. Claudius celebrated the completion of the conduit from the Lacus Fucinus (Lago di Celano) through the mountains into the Liris (Garigliano), a work which had occupied several years. A Sicilian and Rhodian fleet of triremes and quadriremes, with 19,000 warriors, met each other. A silver Triton dived up from the water, and gave the signal with a trumpet. The lake, so says Tacitus, was surrounded with rafts, to prevent evasions. Yet there was room enough for heavy rowing, adroit steering, attacks and all the ordinary incidents of a sea-fight. On the rafts stood divisions of the Praetorian cohorts mounted and unmounted : breast-works were constructed, whence the surface of the water could be reached with catapults. Marine soldiers occupied the rest of the lake in covered ships. The banks and hills formed a kind of theatre, which was filled with countless multitudes of men from Rome and the neighbourhood, come to see the novelty and greet the Emperor. The Emperor, in a splendid general's mantle with Agrippina near him, presided, dressed in an upper garment woven with gold. The combatants, though criminals, fought bravely, and many wounds secured them remission from death. But, at the close, the water would not flow off, and the channels had to be enlarged. After this reconstruction, in 52 A.D. there were gladiatorial games given, bridges being erected for the purpose of fighting on foot. A banquet was given near the outlet of the water, but the current was too strong and carried away the wooden buildings, and caused a panic.

Nero used Augustus' naumachy for a banquet-room, and Titus at the hundred days' celebration in 80 for brilliant spectacles. On the first day the water was boarded over and a gladiatorial and a beast-fight held ; on the second, a chariot-race ; on the third a sea-fight between the Athenians and the Syracusans, in which the Athenians were victorious, and finally stormed a fortress erected on a little island. A court poet opined that this spectacle eclipsed all others, even the one on Lake Fucinus. Domitian, eager to out-do Titus, gave a naval fight in the arena of the amphitheatre, and also had a new lake dug out, and a naval fight represented with ships approximating to a real fleet in number. During the performance a cloudburst occurred, but the spectacle had to continue, and the

spectators to remain in their wet clothes ; many fell ill and died. Philip the Arabian also, at the celebration of the millenary of Rome, gave a naumachy, on one of the lakes dug by Augustus and Domitian. The *Descriptio Urbis* estimates five naumachies, perhaps erroneously. In the Middle Ages the region between St. Peter's and Sant' Angelo was called *regio naumachiae*, perhaps a tradition of the scene of several naumachies.

SUMMARY

(a) The gulf between the thought and feeling of Rome and modernity is best instanced in the attitude of cultured society towards the amphitheatre. In all Roman literature, there is scarcely one note of the deep horror of to-day at these inhuman delights. Generally the gladiatorial games are passed over with indifference. Children played at gladiators, as they do now in Andalusia at bull and matador, or formerly in Rome, brigands and *sbirri*. Adolescence was passionately addicted to the gladiators, who were a staple stopgap even in cultured conversation, and proverbs sprang from the arena. It is madness, says Horace, to dispute whether Castor or Dolichus fight the better ; or again, that Maecenas, his supposed intimate friend, deigned to remark in the morning, it was too cold for light clothing, or to ask the time, or whether Gallina, the Thracian, was a match for Syrus. Epictetus reckons among the trivialities of conversation to be avoided, gladiatorial fights. Ovid saw nothing strange in recommending the spectacles of blood as good occasions for love-making. A man, he says, who touches the lady's hand next to him, while asking for the programme, or betting on the result, is often smitten.

The grounds of condemnation are not ours, but the grounds of commendation are our grounds of disapproval. In the adulatory court poets there is no reason for surprise at this. Statius and Martial prostituted their talents to panegyricize Domitian and his spectacles. Martial says that the feats of the beast-fighters out-rivalled those of Hercules. Statius compared female prize-fighters with the Amazons, and the sight of dwarfs hacking one another about, was one for Father Mars and the bloody Goddess of Bravery to laugh over. Also a sense of defiance of Greek culture created some lame and

one-sided apologists ; Cicero objected to the crude slaughter, but says, cruel and barbarous as gladiatorial fights may appear to some, and really may be, the sight of criminals fighting for life and death was the most effective training for the eye, though perhaps not for the ear, in the endurance of pain and death. Pliny approves a friend who gave a brilliant exhibition of gladiators with a large number of panthers at Verona in his wife's memory, and Trajan for granting the people this spectacle : ' no enervating and depraving sight, but one that inspired disdain of death and love of honourable wounds, and aroused ambition even in slaves and culprits '. Gibbon rightly calls this ' a vain and cruel prejudice, so nobly confuted by the valour of ancient Greece and of modern Europe '.

Worse even than these apologies is Cicero's pronouncement on the beast-fights : ' What pleasure can a cultivated man have in seeing a huge animal tear a weak man to pieces, or a splendid animal pierced with a spear ? ' Varro's phrase in one satire, ' Are ye not barbarians, to throw criminals to the wild beasts ? ' is out of its context and inconclusive. Marcus Aurelius, who stemmed the bloodshed as much as he could, said in his *Meditations* that the amphitheatre is wearisome and always the same. Tacitus says, whilst blaming Drusus' (the son of Tiberius) lust in murder, that he was too fond of blood, however cheap. Symmachus, the last of the Romans, characteristically says of the suicide of his captive Saxons in the Gladiatorial School, ' evidently, no guard, however efficient, can restrain this desperate race '. He puts the suicides on the same level with Spartacus and his troop, and resigns himself to the mishap with the self-consolations of Socrates.

Only one extant Roman writer attains the ground of common humanity, and he only in his latter years. Seneca, in a composition of his manhood, calls the gladiatorial games a light distraction, which does not banish grief. But, in his latest writings, he repeatedly is indignant that a man, who should be sacred to man, should be killed for mere sport, and once breaks out at a particularly barbarous exhibition, evidently sincere despite his rhetorical language. Once he went about midday into the amphitheatre. The house was almost empty, and, to amuse the few onlookers, a few unpractised and almost unarmed criminals were forced to kill each other ; such a fight would not have interested the general public.

'In comparison', says Seneca, 'all the preceding games were pure mercy. This is sheer butchery. These men are defenceless, and no stroke can fail. Yet the populace prefers this to the regular duels. And why not? Helm and shield, and weapons of defence and a swordsman's skill prevent death. In the morning men are only thrown to lions and bears, but at midday, to their hardest fate, to the spectators. They are whipped into wounding naked bodies. And this much for the intervals, which can be utilized for slaughter'.

This single expression of what is to us a needless commonplace proves that the noblest regarded the games from a standpoint miles apart from ours. The main reasons are three: the division of mankind into those who had rights, and those who had not; the effect of habit and the intoxicating effect of splendour. In ancient Rome down to very late times there was no idea of the rights of man, of the sanctity of life, or of thought for its preservation. International law was almost non-existent; slavery fixed a wide and impassable gulf between those with rights and those without them, and fostered the regarding of slaves by a slave-standard, as negligible, and their sufferings and death as unimportant. The fighters in the arena were public enemies, barbarians, criminals, slaves or ne'er-do-wells, either indifferent or dangerous to society. In rough warlike times Etruria introduced her sport into Rome: at first it was occasional, but, with the centuries, became usual and frequent. The acquired love of brutality was perpetuated from age to age, an irresistible spirit of the time, which can convert original loathing into pleasure, and pervades every individual. And besides, at all epochs, torture and executions have been attractive. In 1787 (according to Tischbein), at a burning of some witches in Palermo the fashionable ladies present had sherbet and ices served.

Lastly, the amphitheatre, apart from the fights, attracted, as the most gigantic spectacle the world has ever seen. In the Empire, nothing could arouse the vision of Rome's past greatness as much as the sight of the people assembled in the Flavian amphitheatre. Contemporaries rightly esteemed it one of the wonders of the world. It stood on eighty mighty arches, rose in four floors to the height of 150 feet and seated 40,000 or 50,000 spectators. The Senators sat on the inmost or lowest row nearest the arena. Here there sat the scions

of the old houses, the dignitaries of the monarchy in their robes, the colleges of priests in their vestments, and the Vestals, and in the middle of this brilliant group, on an open seat or in a gorgeous box, the emperor with his suite. Or some Oriental potentate in high cap and broad gay garments sparkling with jewels, attracted the general gaze, or a German chieftain, in close-fitting dress, excited the admiration and envy of the Roman ladies with his huge stature and blonde hair. For in these rows sat foreign kings and ambassadors, and distinguished prisoners were on such occasions shown to the people. The thousands of the other ranks covered the marble seats, rising in circles above this first row. In them were seen races the most diverse in appearance, colour and costume. All the Roman citizens wore white togas, in honour of the Emperor and the festival. The women's seats were in the upper tiers; only the Vestals and imperial ladies had the privilege of a near view of the scenes of blood. Highest of all were the crowds of the ill-dressed ragged proletariat.

A bird's-eye view revealed this throng in a simple and magnificent unity. The architectural lines were raised into relief with rich and artistic decorations, and the frame was worthy of the mighty picture. A huge awning could be spread over the whole space as a protection against the sun, whose bright colours flooded the interior, as in one of Nero's spectacles it represented the starry sky. And, out of the arena, fragrant fountains threw up jets of water to an immense height and cooled the air, while swelling music drowned the noise of the combat.

Every art thus combined to intoxicate the senses and acclimatize the soul to things wonderful and vast, and to quiet all moral scruples. In a huge excited crowd individual feeling to a certain degree lapses, and resistance is borne down. St. Augustine tells a tale which may well be typical. One of his friends, Alypius, a youth of good manners, was staying at Rome to study law. One day he met some acquaintances, who induced him by friendly insistence to enter the amphitheatre; he, a Christian, said his body might go, but not his soul, for he would keep his eyes shut, and in reality be absent. He did so until one huge cry, at some incident of the fight, struck his ears; and curiosity made him open his eyes; and then his soul, says the writer, received a

severer wound than the body of the man he wished to see, and he fell more pitiably than the man whose fall had aroused the shout. For the sight of blood made him inhuman; he looked on steadily, and was possessed with lust of blood. And what more? He saw, shouted, was fired with passion, and came again, with the enthusiasm for it in his blood.

Spanish bull-fights cannot compare, in point of splendour and excitement, with the shows of the amphitheatre, yet they indicate some measure of the impression produced. The very sight of the *Corrida de Toros* and the throngs in the amphitheatre is said to be overwhelming, though only 9,500 can be accommodated. In 1804 a man like Rist found in bull-fights a new and wonderful charm; the beauty and strength, the craft and fury of the bulls attracted him, as also the 'wonderful charm of a really popular spectacle, unknown elsewhere in Europe'. Prosper Mérimée speaks of the irresistible attraction of bull-fights. He refers to St. Augustine's tale, and confesses that no tragedy ever excited him so much, that he never missed a bull-fight, whilst in Spain, and preferred the bloody ones. Emperor Maximilian of Mexico also was an enthusiastic admirer of bull-fights.

(b) Only very slowly and gradually did Christianity succeed in weaning the ancient world from the bloodshed of the arena. Very many Christians frequented it; and their imagination was stirred by it; thus, one of the visions that tempted St. Hilarion in the desert with the desires of the flesh, was a chariot-*eer*, who sprang on his back and rode him like a horse, and also a gladiatorial fight, in which one combatant fell at his feet and entreated him to bury him. Constantine on October 1, 326, in an edict dated from Berytus censures the holding of the 'bloody spectacles' in times of peace, and orders convicts to be sent to the mines instead; but this was not intended as a prohibition. For, in a later Epistle to the town of Hispellum (Spello) he accedes to the request that the priests of Umbria should be allowed to continue their scenic and gladiatorial games, but the priests of Tuscany should still hold theirs at Volsinii. Firmicus Maternus, the astrologer (about 350 A.D.) states the constellations under which gladiators and athletes were born, and others, which predetermined them to a horrible death in public view. In 365 a law of Valentinian's forbade the condemnation of Christians to the School of Gladiators. Pru-

dentius vainly besought Honorius to abolish the practice of turning a death sentence into a public amusement, and to allow only beast-fights in the arena; but in 404 the same Emperor prohibited gladiatorial games at Rome, the immediate cause being that an Asiatic monk Telemachus, who had rushed in amid the combatants to separate them, was torn to pieces by the irritated populace. The imperial gladiatorial schools had already been abolished in 399. But in the West the gladiatorial games still lingered on. In 410 St. Augustine speaks of gladiators as still existent. In the East they ceased by 400 A.D.; St. Chrysostom in his sermons constantly reprehends the Circus and Theatre as sinful and injurious, but never mentions the gladiatorial games, which he would certainly have attacked with greater zeal and reason. But he and other Christian teachers fulminate against the beast-fights as inculcating callousness. So, too, presbyter Salvianus of Marseilles complains of the spectacles at which the main delight of the spectators is to see men torn to pieces and devoured by animals, and of the futile trouble of penetrating forests and deserts, the Alps and snow-clad valleys to capture the animals.

The *ludi bestiarum* persisted in both East and West at least into the sixth century. In 469 Leo and Anthemius prohibited the *lacrimabiles venationes* on Sundays. Turcius Rufius Apronianus Asterius, consul in 494, in his MS. of Virgil (now at the Medicean library at Florence) boasts of having instituted stage-plays, chariot-races and *venationes* in the Roman Circus. In 536 Justinian expressly legislated that the consuls were to give *venationes* besides other games. January 1 was devoted to the solemn entry upon office of the new magistrate, the second (called *mapa*) to the games in the Circus, the third to a *venatio*, the fourth to a very popular species of *venatio* called *μνημέριον*, at which the people could enjoy the courage of men fighting animals, and the fifth to very dissolute plays, called *πόρναι*, on which day tragedians and chorus were also seen; on the sixth day there was a second *mapa*; on the seventh the office was solemnly resigned. Two years before, Justinian, writing to the archbishop of Constantinople, complained of clerics not abstaining from this spectacle. At the same epoch, Cassiodorus at Rome was admiring the skill and speed with which the *bestiarum* escaped the

animals, and the many ingenious means of protection, some of which have come down to us on the carved ivory lids of the invitations sent by the consuls: thus at Rome some efforts were being made to make the *venationes* at least a little less bloody.

(c) Wherever Roman civilization set its mark, the amphitheatre also spread; from Jerusalem to Seville, from Scotland to the borders of the Sahara any town of consequence had its annual victims of the arena. The yearly magistrates had the choice of games they should give, and would often enough defer to the popular desire for gladiatorial fights. Officials and priests also gave them at their own expense in acknowledgment of the honour, as did rich private individuals anxious to make a show or win the popular favour. In some cities, such as Praeneste, there were special annual *curatores* to administer the communal gladiatorial games or moneys bequeathed for the purpose. Such games were subject to legal restrictions, relaxations of which had to be sought from the Senate or the Emperor. Besides textual information, various monuments, and the ruins of amphitheatres in various provinces give some indication of the extent of the games.

Italy was the most prolific in these games, and still exhibits most ruins of amphitheatres. No town, however small, had not a periodical show of prize-fighters or wild swine and bear-baiting, and the larger the town, the larger its expenditure on popular amusements, on a scale we should consider extravagant. Law restricted the outlay to a reasonable sum (e.g., at Urso to 14,000 sesterces or £152 10s.), but custom and public opinion no doubt exacted much more from the officials. At Urso the whole of the games were to last three or four days, but there is evidence to show that in Italian cities gladiatorial games and *venationes* by themselves lasted three or four days. Bulls, stags, hares, wild swine and bears were common enough in the Apennines, and were often hunted; but they also had leopards, panthers and ostriches (called popularly 'oversea sparrows'); and, according to Pliny, in the municipia the *bestiarii* fought in silver armour; this had been one of Caesar's extravagances in Rome one hundred years before. In the smaller or poorer towns three or four pairs fought; in the larger, ten, twenty or thirty. At Pompeii Aulus Clodius Flaccus in his second duumvirate (the highest municipal office)

exhibited thirty pairs of athletes, and five of gladiators on his own account, and, with his colleagues, thirty-five pairs of gladiators, bull-fights, and a chase of boars, bears, and other animals. Further the advertisements of Pompeii tell of five *honoratiores* as institutors of gladiatorial games. One Numerius Festius Ampliatus and his troop is announced as 'the desire of the world'; he appeared there, and probably was an itinerant contractor. In Petronius' romance, Trimalchio's guests converse of a recent combat given by one of the *honoratiores* and of a pending three days' one. In Tiberius' reign the people at Pollentia forcibly prevented the burial of a *primipilaris* until they had extorted money from the heirs for a gladiatorial contest. Martial jibes at a shoemaker at Bononia who gave one, and a fuller at Mutina, and asks where a tavern-keeper is to give one next. In one Italian city a *honorator* who had held the highest city offices, was honoured with a statue on a chariot, for his generosity in general and particularly for having given eight gladiatorial contests, and Floral games besides, by imperial permission; at the solemn dedication of it, his son, in his father's presence, exhibited thirty pairs of gladiators, and a *venatio*. At Allifae a 'citizen of splendid generosity', when made *duumvir*, gave games of thirty pairs of gladiators, and a *venatio* of African animals, and, during his official year, received a contribution of 13,000 sesterces from the city, gave 'complete' *venationes*, a combat of twenty-one gladiators, and, one year later, theatrical plays at his own expense. Similar facts are often recorded, graven on the pedestals of statues, monuments, and grave-stones, so as to perpetuate the generosity of the giver of the festival; inscriptions show how individuals and municipalities vied in shedding glory on their native city on such occasions. The more murderous, the more splendid they were deemed. On the pedestal of a statue erected in 249 A.D., to a citizen who had held every office, and given magnificent spectacles, we read: 'At Minturnae he let eleven pairs appear and fight, until eleven of Campania's best gladiators remained on the field; he also had ten wild bears hunted to death, as you, noble burgesses, well know'. And on the tombstone of one of the highest civic officials of Peltuinum, his giving a 'three days' gladiatorial fight and four criminals' is recorded, the execution of the latter being regarded as a choice extra. Very

probably, providers of festivals requested the corporations to provide criminals for their gladiators or animals.

In the provinces the amphitheatre was most splendid at the capitals, and organized by the provincial priests who held office for one year, and were, in many respects, the most prominent men. Often, it is clear, they owned their own bands of gladiators, which regularly passed on to their successors. After Italy, Gaul and North Africa possess most amphitheatres; and these two provinces and Spain favoured the sport more than any others. The oldest evidence of the existence of Arles (Arelate) is a gladiatorial token of 63 B.C.; hence, long before Roman literature mentions the town (in Caesar) there were combats there. An inscription at Jérez de la Frontera records a spectacle with twenty pairs of fighters given by an official in honour of the Emperor. In the North there are hardly any stone amphitheatres, and the combats must have been rarer, but only because the poverty and rudeness of the inhabitants, the sparse population and the isolation of the Roman towns hindered the spread of Roman influence.

In Greece, superior civilization at least caused less general acceptance of armed combats than elsewhere; yet even there they proved irresistible. The first proof of this is when King Antiochus Epiphanes gave gladiatorial games for the first time in Syria, and perhaps in Greece. The first impression was disgust, but repetition changed the feeling into approval; at first he only allowed fights up to the point of wounding; later, up to the death of one combatant. Then volunteers engaged themselves for trifling pay. And the close association of Rome with Greece after the conquest rendered easier the introduction of this and other Roman customs into Greece, the centre being Caesar's Roman colony of Corinth. For Corinth was non-Greek in character, and a wealthy port with a large corrupted mob; hence, the games would there be popular, and it is the only town in Greece where (before the second century) an amphitheatre can be traced; its ruins still exist. Athens, too, for jealousy of Corinth, followed suit; and, at the end of the first century, there were only a few places, such as Rhodes, which had not seen gladiators. Plutarch recommends the governors of towns to abolish gladiatorial combats, or, at least, to limit and hamper the demand.

But his complaints of the uneducated rich, who did not disdain even this mode of corrupting the people and gaining honour, shows his counsel to have been a counsel of despair. *Venationes* found an easier introduction, especially as bull-fights were already common. 'Any one who would gain popular favour', says Dio of Prusa, 'must get not only jugglers, actors and athletes, but a wild lion or a hundred bulls, or even, should he desire to please the mob, the unspeakable thing' (gladiators). Hadrian at one spectacle in the Athenian *stadium* had a hundred animals hunted. But, in Greece, only the scum of the people liked the gruesome pleasure; the educated unanimously condemned. Like Plutarch, Dio of Prusa and Lucian express abhorrence of the gladiatorial combats, as barbarous, brutish, murderous, and injurious, as depriving the country of its bravest. A Neo-Pythagorean, a zealot against meat, says that the degeneration of taste infected the other senses, and the eye no longer took pleasure in dances, pictures and statues, but in death and wounds and fights as the most precious spectacle. Demonax, the philosopher, advised the Athenians, before introducing it, to demolish the altar of pity. Julian forbade priests to frequent the theatre and considered they and their sons should abstain from the *venationes*.

Gladiatorial combats found their way far more easily into Asia Minor with its mixed half-Asiatic population, and all the East, except Palestine. In Asia Minor Strabo knew of an amphitheatre at Nysa in Caria, and one at Laodicea on the Lycus was built in 79. Alexandria had one under Augustus.

(d) In all parts of the Roman Empire ruins of amphitheatres are found, the most and largest in Italy and Southern France, the fewest in Greece and the Eastern provinces. Their preservation varies with their history. Some fell into disuse in antiquity, after the gladiatorial games ceased, and their masonry was used for other buildings, as at Verona under Gallienus, and in Catania under Theodoric, with his express permission. This manner of destruction lasted all through the Middle Ages and modern times, and accounts for the practical demolition of the greater number. Often, too, in wars and feuds, and in the stormy centuries of the early Middle Ages, they were turned into fortresses, especially by the Arabs.

The defenders fortified them with moats and towers, and rams thundered and arrows and firebrands were directed against the arched entrances, through which surged the gaily-clad crowds of old. Or, in times of peace, poverty crouched by the ancient walls and worked fresh destruction. In many places they became the resorts of prostitution, and in the mouldering arches the dregs of men found clandestine means of crime. Or treasure-seekers dug up the refuse, in the hope of unearthing the remains of ancient wealth; and magicians found a fit place for their craft in the gruesome ruins. Now and again the arena was used for tourneys and ordeals. Or elsewhere the bloodstained ground was ploughed over and the vine and the olive luxuriated on the walls. And new traditions of these ancient sites arose, and peopled them with ghosts and spirits: they were called fairy grottoes. At Pola the amphitheatre is perfect without, and within a ruin; it was said to be the work of a fairy who was to build a palace in one night, and was interrupted at cock-crow. At Bordeaux and Poitiers the amphitheatres are called *palais Gallienne* after a Moorish Princess Galiana, loved (according to an old Spanish legend) by Charlemagne: for her sake he disguised himself and went to Toledo, and overcame his rival at the tourney. An old well near the Tagus is still called *el palacio de Galiana*. Learned tradition connected it with the Emperor Gallienus.

The history of some of these ruins may be traced in outline. When the Franks under Chlodwig in 508 invaded Southern France, the Goths fortified the amphitheatre at Nîmes; dug a deep moat round it, erected two square towers, which were not pulled down till 1809, and quarters for the garrison inside; henceforth it was called *castrum arenarum*. From 720-737 it was a fortress of the Saracens, who were driven out by Charles Martel after a brave resistance. His attempt to burn it down failed. The amphitheatre remained a fortress down to the end of the fourteenth century, and was held by a kind of knightly order, the *milites castri arenarum*. Then, in time, it became the habitation of the poor, its interior filled with hovels, and was for several centuries a *quartier des arènes* with a population of 2,000, who spoke a dialect of their own. In 1533 Francis I visited Nîmes, and was amazed at the remains of antiquity. He knelt down to

decipher the inscriptions, and rubbed off the dust with his handkerchief. The city presented him with a silver model of the amphitheatre, but did not carry out his order to destroy the hovels. In 1809 the arena was cleared. Now the equestrian sports, wrestling-bouts and bull-fights, so popular at Nîmes, are held in it, and it can still seat 15,000. The neighbouring amphitheatre of Arles fared similarly; Henry IV had designed its clearing and the erection of an obelisk found in the bed of the Rhône.

At Fréjus the Saracens who were invading and plundering Provence built a fortified camp in the amphitheatre. The population had left the town after its utter destruction, but gradually came back at the request of the bishops, who administered the Church from the seventh century; the new town was fortified in the tenth century by Bishop Riculph out of dread of the barbarians. The materials were taken from the amphitheatre, which was also destroyed, so as not to afford the Saracens any point of vantage. Thus it became a complete ruin. When Charles V was threatening a siege of Fréjus, (which he did not carry out), the destruction of what still stood erect was part of the scheme of defence. In 1828 it was excavated.

The amphitheatre at Verona was first destroyed in ancient times; some of its stones can be seen in the wall hurriedly erected in defence, when, under Gallienus, a barbarian invasion was apprehended. A description of the town in King Pepin's day calls it the 'labyrinth, out of which one could only find the way with a lamp, or thread'; and Bishop Rather, the 'circus, named the arena'. At this time (tenth century) and later it was used as a fortress, and later for legal and other duels. In 1263 some Visconti had the right to an impost of twenty-five *lire* on every duel fought there, in return for which they kept the ring clear with armed men. In the time of the Scaligers and at other times, great men were beheaded in it. During the fifteenth century it was the home of prostitutes, who paid the city a tax for it. As in all cities where there were amphitheatres, its stones had been removed for building material; but Verona is distinguished by her early care for its preservation. In a Statute of 1228 the *podestà* promises to pay from the communal purse 500 *lire* in his first half year of office for the restoration of the

arena, a large sum in those days ; a second Statute, before 1376, orders the arena to be locked and the keys kept by the community, as many crimes was committed in it ; any damage to the walls or pollution of the building was to be punished. In 1474 a Statute forbids the removal of stones and steps. But most of the latter had already vanished ; in 1480 a poet calls it *gradibus vacua*. In the sixteenth century the restoration began. After 1545 a citizen was periodically elected to supervise the preservation of the ruins ; in 1568 money was collected for the restoration of the steps ; in 1579 a tax to be raised every fourth year was introduced to provide for restoration, and a quarter of the fines were also to be devoted to this end. Similar resolutions were frequently passed by the Councils of the Twelve and the Fifty. In the seventeenth century two *Presidenti dell' Arena* were nominated. Often, as in 1622 and 1654, tourneys were held in it ; as also in the sixteenth century and earlier, e.g., in 1222. In 1716 a tilt at the ring took place in honour of the Elector of Bavaria. Marchese Maffei, the author of the history of his native city, from which we quote, at the end of his book beseeches the noble youth of Verona to use this unique amphitheatre from time to time to exhibit their courage. When Napoleon visited the town in 1805, a dog and bull-fight was performed in the amphitheatre, and 40,000 voices greeted him, a striking incident at such a place. At the Congress of 1820 fireworks or races were held there and the 'police drove up the neighbouring population to fill the huge circle and duly honour the guests'.

But the greatest of these ruins is the Colosseum. Avarice and fanaticism soon stripped it of its decorations, but its walls survived the Empire in their entirety for many a century, and in the eighth century evoked this cry of admiration : 'As long as the Coliseum stands, Rome will stand ; when it falls, Rome will fall ; when Rome falls, the world will fall'. In 1084 the first destruction began, when Robert Guiscard devastated the town between Mons Caelius and the Capitol ; internal feuds produced further destruction, when it became in the twelfth and thirteenth centuries the fortress of the Frangipani, the leading family of the *regione di Colosseo*, one of the thirteen divisions of Rome. In 1244 Frederick II forced them to resign part to the Annibaldi, who gave refuge to Conradin

in 1268 after the battle of Tagliacozzo. In the beginning of the fourteenth century it came into the power of the People and Senate of Rome, who on September 3, 1332, held a great bull-fight in it. All the barons of the neighbourhood were invited; three noble ladies had the duty of assigning the ladies of the city their places; the names of the fighters, taken by lot, were announced, as well as their colours and mottoes. Eighteen of them remained on the field, nine were wounded, and eleven bulls killed; the bodies of the Paladins who fell were buried with great pomp, attended by the thronged people, in Santa Maria Maggiore and San Giovanni del Laterano. In 1381 the Senate and People presented a third of the Colosseum to the Fraternity of the Chapel of the Sancta Sanctorum, in return for their work in restoring order in that region; for the ruin had become a mere robbers' den. The Brotherhood walled up some of the upper arches, and thus made some corridors for a hospital, afterwards united with the Lateran hospital. Native and foreign pilgrims flocked in to kiss the soil of so many martyrdoms, and, out of their alms, a chapel was built on the height of the ancient *podium* and a hermit's dwelling erected beside; above the Chapel was built a walled-in stage, on which every Good Friday a Passion Play was performed, which is mentioned in many documents of the fifteenth and sixteenth centuries; under Pius III it was discontinued. Meanwhile the amphitheatre was being steadily stripped for building purposes. At the beginning of the fifteenth century Poggio complained that 'Roman stupidity' had reduced the remains of the Colosseum to ashes. Paul II used the squares of travertine to build the palace of San Marco di Venezia, and Cardinal Riario for the Cancelleria built by Bramante, and Paul III for the Palazzo Farnese. Sixtus V designed erecting a cloth fabric in the Colosseum and workmen's dwellings, but died before carrying out his plan. A concession for holding bull-fights in it was given in 1671 to two competitors for two years; but no one availed himself of it. In the Jubilee of 1675, to prevent further misuse and profanation, the entrance arches were bricked up. In 1727 we read of a licence to the hermit to sell the grass that grew in it. But all measures for its security failed, until Benedict XIV was induced by a murderous assault on the hermit in 1741 to make ampler provision for its preservation. Under

Pius VII restoration began, which, unfortunately, has proceeded with the usual Italian disregard of the style and character of the original.

In 1864 the Colosseum was no longer the building that evoked for Byron the ghosts of the dead who drenched the ground with their blood, flitting about in the moon-lit ruins. The luxuriant greenery on the walls had disappeared, and the modern brick was in staring contrast with the ancient travertine squares. On the top of the walls there were telegraph-wires; and a French sentry stood at the entrance. Two afternoons in every week a Capucine monk preached in the arena to an audience of devout women of the lowest classes, and the walls then re-echoed once more with songs of praise and penance.

III. THE THEATRE

The theatre, the least costly and troublesome of the spectacles, was the most frequent and the least appreciated. From the beginning of the Empire Rome had three permanent theatres, which all together did not seat as many as the amphitheatre. Probably plays were performed in all three at once only very exceptionally; usually the theatre of Pompey sufficed. What with the powerful excitement of circus and arena, the stage could only draw its audience by ignoble means, rough jokes and sensual by-play: thus, far from counteracting the corrupting influences of circus and arena, it heightened them.

Of the types of drama then existing, under the Empire the two lowest prevailed, the *atellana* and the *mimus*. The *atellana* was a sort of Punch and Judy show; it originated in Campania, where it still flourishes, but was early transplanted to Rome: from an improvisation, in Sulla's time it had become literary. A short piece generally in one act was performed by four stock figures or masks, the prototypes of the modern Italian comedy of character. These were Pappus the dotard, now the pantaloon; Dossennus the wise man, now the *dottore*, a schoolmaster or soothsayer; and the glutton and the booby, Bucco and Maccus. Many titles of *atellanae* have come down from earlier times, which indicate the subjects treated: probably the subjects remained the same under the Empire.

There were also travesties of myths, e.g. ; the stories of Pen-theus, or the supposititious Agamemnon. Or nationalities were brought on the stage, such as 'the Campanians', 'the Trans-alpine Gauls', 'the soldiers of Pometia', and the city was no doubt much tickled by provincial speech and manners. Still more subjects were drawn from rural life, e.g., 'The Kid, the Sick Boar, the Boar in Health, the Cow, the Poultry-yard, the Vintagers, the Woodcutters'; or the occupations of town, e.g., 'fishermen, painters, criers', and above all the fullers, who played a large part on the Roman stage. Other titles give the four actors in various comic situations, e.g., 'the two Macci; Maccus as an old maid, as a soldier, as a publican, in exile; the two Dossenni, Pappus the farmer, Pappus' bride; Bucco in the gladiatorial school'. Ghosts often appeared as well. This popular comedy was grotesque, full of broad humour and indecent references.

The mime was a loosely constructed character-sketch of common life, as short as the *atellanae*, but without its stock types. Like the *atellana* it was used as an interlude or after-piece to other plays, and was, in Cicero's time, the more popular; under the Empire the mime is more often specifically mentioned; it was the longest lived species of drama, and survived the Empire of the west, and in the East, in the time of Justinian, had full sway of the stage, as tragedy, music and juggling wearied the public. Surviving titles indicate the same subjects as those of the *atellanae*, but they were drawn from town rather than country life, especially that of the lower classes and artisans; they also represented scenes from foreign life, and, occasionally, mythological incidents. Lentulus and Hostilius' mimes, according to Tertullian, ridiculed the gods; made Anubis an adulterer, and Luna a man; whipped Diana off the stage, read the will of Jupiter deceased, or quizzed the three famishing Hercules. 'Anubis as adulterer' possibly referred to the seduction, in Tiberius' reign, of a noble lady, by a lover in the disguise of Anubis, or something similar. In a mime played on the day of the murder of Caligula, the crucifixion of the famous brigand Laureolus was acted, the flow of blood imitated, and scoffed at by bystanders. In another mime performed in the theatre of Marcellus in the presence of Vespasian, a dog played the principal part, took a narcotic, and slept and awoke regularly, to the general

astonishment. Plays with motives of pettifoggery and demagoguery were often represented, but adultery and love affairs were the principal themes. The surprised lover escaped the husband by being trundled away in a box; the husband sent his pretty wife to a dangerous enemy, to purchase safety by her charms, and so forth. Or Fate proved miraculously generous or just, as in modern farces; beggars were suddenly enriched, and rich men, forced to flee, ran across the stage with their cloaks round their head, except their ears, with which they anxiously listened for their pursuers. Abuse and blows, and resounding slap on the ears of fat-cheeked boobies (*stupidi*) were regular incidents of the horse-play. The language was full of vulgar turns of expression, and the humour coarse, with an abundance of grimaces, scurrilous gestures, and, above all, grotesque dances to the flute. Under the Empire mimes borrowed from the ousted comedies a larger number of actors, and sustained action. But, as before, pieces with easy *dénouements* were common; to terminate the piece, one character, e.g., the detected lover, ran away, the music stopped, and a dance marked the end. The scenery was very simple. The mimes acted in the front of the stage, without the buskin of comedy or mask, in a motley harlequin's dress, with a mantle flung over it; a curtain cut off the back of the stage. Next to the principal actor, on whom the success of the farce depended, ranked the character of the booby or the parasite, distinguished by fat cheeks, bald head, and probably a special costume.

The mime was the most frankly outrageous of the farces in immorality and obscenity. During the Republic this licence was excused by the character of the Games of Flora, at which they were mostly performed; later, this excuse failed them. In the mimes, and nowhere else, female parts were played by women, who would dance at the request of the audience, throwing off their upper garments, and appearing almost naked. Ovid quite rightly objected to his poems being called immoral, when emperor and senate, women, girls, even children went to see mimes, where the one theme was the cuckold, and where eye and ear alike saw and heard indecencies. And the lewdest scenes were the most applauded, and the best paid by the praetors. Martial, too, said that women who went to the mimes need not object to his most

indecent verse : in his eighth book, which was dedicated to the emperor, he restrained his 'mimic licence of speech'. Hence the Christian pulpit unsparingly denounced—probably ineffectively—visits to the theatre. Salvianus asks his Christian readers on their conscience, if, on one and the same day, there be a church festival and a theatrical performance, how many Christians prefer the words of Christ to those of the mime ; and yet, the theatre taints the soul, the eye and the ear with unspeakable presentations of immorality. A proof of this licence is afforded in Aelian's characterizing a courtesan of the lowest kind as 'less restrained than an actress in the mimes'. And Procopius' accounts of Theodora's mimic performances give the same impression, if she, who was afterwards Empress of Christian Byzantium, out-shamed the most shameless of Roman dancers. Further, in the fifteenth and sixteenth centuries, female dancers not infrequently performed on the stage and elsewhere absolutely naked.

A speech in defence of the mimes, composed by Choricus, a rhetor under Justinian, shows that in the Eastern Empire of that date, the subject and manner of these farces were essentially the same as they had been in the west. There were scenes of adultery, in which the husband ordered a slave to bring him a sword to kill the adulterer, and then decided it was better to prosecute ; or scenes of sodomy, frequently enacted. The indecent songs in these plays were set to easy melodies and heard in every street. Representations of the Trojan War, of fights between Trojans and Myrmidons, must have been travesties. In the mimes the most various personages were represented, masters, slaves, pedlars, sausage-sellers, cooks, hosts, guests, people in commercial relations, stammering children, lovers, hot-tempered young men, and others who appeased them. Some pieces were sensible throughout ; husbands were made to incite their wives to continence and good fame, or good and bad soldiers or rhetors were opposed, and the bad ones hissed, the good applauded. The mimes had to have good voices, to know how to dance and look bewitching. Further, the shaven heads of boobies and parasites were regular features, and resounding boxes on the ear were lavishly distributed.

Mimes and *atellanae* were liberally used in Rome for allusions to public affairs and to the Emperors even. Actors and

public came to an understanding ; significant passages relating to the present were accentuated, so that there could be no mistake about the meaning ; improvisations and gags were inserted, and the certainty of a clamorous reception made actors, and poets even, careless of the risk. But, generally, the emperors found it best to wink at such allusions as far as possible. Julius Caesar even had to tolerate an allusion of Laberius, the writer and actor of mimes, to his *coup d'état* ; after his murder, Cicero asked Atticus to report to him the gibes of the mimes and the reception they met with. Once a mime was being performed in Augustus' presence, and the words 'Oh the good and gentle master' were recited ; a general burst of applause broke out to interpret the words as an appreciation of the emperor ; Augustus received the outburst in stern silence, and on the following day rebuked such flattery by a sharply worded edict. On another occasion, the audience interpreted an inoffensive verse as an allusion to Augustus' effeminacy. During Tiberius' residence at Capri, a passage in an *atellana*, hinting at his debauchery, was received with wild applause. In 22 or 23 A.D., some years before his leaving Rome, Tiberius was induced by the reports of some praetors as to the impudence of the actors, to address to the Senate an intimation they must proceed against the *atellanae*, as the frivolity of the entertainment surpassed the bounds of decency. How this was effected there is no record ; historians only mention the banishment of the pantomimes for quite different reasons. Caligula had one composer of *atellanae* burnt alive in the arena for a jest that might have been intended to reflect upon him. After Nero's murder of his mother, one *atellana* actor, Datus, accompanied the words 'Hail, Father, Hail, Mother' with the gestures of a man drinking and swimming, hinting at the poisoning of Claudius and the drowning of Agrippina : Nero was content with banishing him from Italy. Galba was reputed harsh and avaricious ; when he entered Rome as Emperor, at the next *atellana*, a well-known choral song was sung, in which the family complained of the return of the old master from the country ; the audience joined in and repeated the verse several times. At this epoch this stage licence seemed compatible even with a solemn funeral. At Vespasian's obsequies, the *archimimus* Favor acted Vespasian, and endeavoured to

reproduce his character and language ; he was asked what the funeral cost, and answered : ' ten million sesterces, but give me 100,000, and then, if you like, throw me into the Tiber '. Helvidius Priscus the younger was executed by Domitian for turning his *atellana* Paris and Oenone into a satire on the emperor's divorce. Marullus, a writer of mimes, might freely scoff at Marcus Aurelius and Lucius Verus on the stage, and unmistakable references were made in mimes to the well-known amours of Faustina and the disgraceful life of Commodus ; the Emperor Maximinus, who knew no Greek, was publicly insulted in his presence in that language. In the Eastern Empire mimes enjoyed the same licence. Choricus states they freely criticised high officials and the emperors even, and effected, if not the removal of grievances, at least their attempted concealment. Further mimes on the stage not infrequently mimicked great personages. Seneca says of one Hostius Quadra, that he was a man of incessant lewdness on the stage. Vitalis, the mime, says on his gravestone : ' Any one I represented shivered, as though at his double ; and many women whom I imitated on the stage blushed and were overcome with confusion '.

The masses then were satisfied with these farces, but the cultured, who desired an artistic drama, were too few to maintain it, since it did not attract the ruder elements. Petronius' Trimalchio says he has bought a troop of comedians, but prefers they should play *atellanae*. Prolific writers of tragedy and comedy (which, at their best, were mere imitations of Greek models) had long ceased to exist : a few stragglers survived to the end of the first century. The last writer of artistic dramas, known to have had his plays acted, was Lucius Pomponius Bassus, the consular, under Claudius ; most of the dramas were only intended for the study or *salon*. New mimes were written down to the end of the Empire, on ephemeral topics. The statement that Genesius (who was afterwards martyred) played in a mime under Diocletian, and ridiculed Christian baptism, is quite credible. And what demand there was for artistic drama was fully met by the ancient tragedies and comedies, in more or less modernized forms.

The only Roman comedy (*togata*) recorded as acted under the Empire is Afranius' *Fire* (Incendium) ; it was played at

a great festival given by Nero, and the actors were allowed the plunder of the real house which was burnt on the stage. Probably this style of comedy remained on the boards. Of artistic dramas, however, the New Comedy of the Greeks (represented chiefly by Menander, and imitated by Plautus and Terence) retained the firmest hold on popular favour. In Rome, in Italy and the provinces, the stock figures of travestied gods, doddering kindly fathers, mawkish sons, cunning slaves, braggarts, whores, etc., delighted audiences for centuries. To keep interest alive in these well-worn plays, known to most of the spectators, at least at Rome, good acting must have been essential. A comedian's training was at the end of the first century, and probably later, a strict tradition, and rhetoricians recommended their pupils to learn their correctness of expression, apt delivery, modulation of the voice, deportment, and the play of eye and hand. One of Marcus Aurelius' first teachers was Geminus, the comedian, and, probably, an all-round education included elocution lessons from a comedian. The studied elegance, which the Ciceronian epoch admired in Roscius, had become old-fashioned and ridiculous a century later: 'a sombre, undecorated piece of antiquity', says Tacitus, 'would have been as intolerable to the audience at judicial proceedings, as the gestures of a Roscius or Ambivius Turpio on the stage'. Acting had become more realistic, but still less so than on the contemporary German stage. Actors took their parts seriously: Quintilian often saw them leave the stage weeping after an affecting scene. The manner of declamation approximated to everyday speech, but was no mere copy; it added style and nobility. Gestures followed an exact school; Quintilian's precise precepts for an orator's gesticulations imply similar conventions for the stage on a larger and sharper scale. The pace of walking was to follow the nature of the rôle, to be slower for youths, old men, soldiers and married women, and quicker for slaves, maid-servants, parasites and fishermen.

In the time of Juvenal and Quintilian the great comedians on the Roman stage were Greeks; Juvenal calls them born actors; Demetrius and Stratocles were the most famous. Quintilian's sketch of both shows how sharply the line was drawn between the licit and illicit, and how keenly any transgression was felt. Demetrius had a splendid voice, great

beauty and a fine figure, and played quiet parts best, such as gods, youths, fathers, wives, and respectable old ladies ; in passionate gesture, prolonged and harmonious exclamations he was unrivalled ; as also in his skill in inflating his garments by respiration as he walked, and his movements on his right side. Stratocles had a sharper voice, possessed great vivacity and adaptability, could venture on a laugh, out of harmony with his mask, or even shrug his shoulders. He was best as decrepit old men, rascally slaves, parasites and pandars. Both actors allowed themselves to break the rules, not out of ignorance, but in complaisance with popular taste. Further, the best effects of the one would be frightful in the other. Juvenal, besides these two, names Antiochus, and Haemus for his adaptability, as great artists, and mentions as perfect performances the three female characters of the *palliata*—the matron, the courtesan, and the maiden.

Far more than comedy, tragedy found an audience among the educated minority. The nerves of the mass were attuned to the arena, and unaffected even by the most horrid realism. The mimicry of the stage could not affect them, and ideal figures were meaningless shadows ; how should they care for Hecuba ? But, even in cultured circles, they were few who did not prefer the merry scenes of Plautus, which all seemed drawn from their own actuality, to the fates of the rulers and heroes of primitive Greece. Besides, the costumes made tragedians look like ghosts from a dead world ; strange figures in *cothurni*, as though on stilts, padded out, and wrapped in long trailing garments, with lofty wigs, with masks with mouths big enough to swallow the audience : they must have seemed ugly or laughable. Philostratus says that at one town in Baetica the inhabitants had never seen a tragedian ; the first one they saw frightened them out of the theatre. Even in the late Republic, magnificence of scenery had become the best or the only means of keeping public attention in a tragedy. Military evolutions of great companies of foot and horse, huge processions, triumphal or otherwise, with all sorts of costly foreign garbs and exhibitions, such as ships, chariots, booty of war, giraffes and white elephants even—the piece lasted four hours or more in consequence—such were the devices that constituted the chief attraction of tragedy, even in the time of Horace. ‘Even among the knights’,

he says, 'the delight of the ear has degenerated into mere cozening of the eye'. Those who enjoyed an artistic production, came to see, not the play, but the *mise-en-scène*, not the poet, but the actor. Hence dramatic interest lapsed; tragedy was dissolved into a succession of single effective scenes, in which the actors could best exhibit their skill, and the development of the drama was sacrificed, as a matter of indifference to the spectators. True, perfect tragedies, in abridgment, were still acted at Rome and in the provinces (especially the Greek ones), but probably only until the second century, when tragedy was replaced by choric scenes and pantomimic dances.

For music and dancing had of old been essential parts of the stage, Greek or Roman. Pure opera, without any spoken parts, was unknown to antiquity, for iambic dialogue was always spoken. But the composer had almost as large a share as the poet for a great part of the drama. In the dialogue the actor welded together elocution and gesture, but in lyrical monologue, gesture became dance, and elocution song. Hence, either one mode of expression had to be abandoned, or two exponents called into play. In fact, two different artists performed; this proves, better than aught else, how little ancient drama strove after, and how little ancient audiences desired, illusion; the stage never permitted of any false idea that anything real was in progress. The stage, of set purpose, rejected realism; the acting was to be understood and criticised only as a product of art, which not only had no reality, but excluded any notion of it. Certainly, tragedians must always have been skilled singers, and often, if not mostly, have kept their vocal parts, but it also often happened that they played their parts in unspoken pantomimic dance, whilst a singer stood quietly by and spoke the words which should have been theirs. This strange separation of elocution and action seemed quite natural; in Pliny's time poets had their works recited before a large audience by men with a better voice, and accompanied them by 'play of countenance, gesture, and murmurs of applause'.

This severance of song and dance on the stage heralded the dissolution of tragedy into its elements. By the decay of feeling for drama, and the greater appreciation for dance and song, the process was completed; at the close of the

Republic, performances of vocalists, dancers with a flute accompaniment, were given as complete in themselves. At this point only those pieces will be considered which retain some vestige of the dramatic, namely, the pantomimes, and tragedians' recitations, of which the former was connected and self-complete, the latter rhapsodical. We know little of these tragic performances, as they never even approximately had the vogue of the pantomimes on the public stage.

Tragedians, as in the real drama, appeared in masks and full costume. But they practically confined themselves to song, with some action, which, however, remained a secondary feature, unless a full performance were given with a second actor. It is absolutely uncertain, whether this actor, who is sometimes mentioned, stood beside the vocalist; whether the soloists had a choir to accompany them; whether the same tragedian played several parts in succession; whether, and how, the various solos were linked together; whether *mutae personae* completed the representation; whether, and how, spoken dialogues went with the solos. This much only is clear, that the tragedians' solos were the kernel of the performance, and monopolized public attention. This was the drama Nero loved to appear in, relying on his imagined skill as a vocalist. He sang, according to Suetonius, tragic scenes in masks, which, if male, and representing gods and heroes, were made like him, and if female, for goddesses and heroines, like his lady-loves. He sang as *Canace parturiens*, Orestes the matricide, Oedipus blinded, and Hercules mad. It is said that a young soldier, who was standing sentry, whilst he was acting *Hercules Furens*, saw him dressing for the part and being fettered, and rushed in to set him free. It was also observed that, in his last public appearance as an actor, a very famous version of Oedipus in Exile, his song ended with the words: 'My wife, my father, and mother are driving me unto death'. The text is in Greek, and Roman tragedy may often have been in Greek; a foreign language in opera would not disturb the hearers, any more than modern Italian opera outside Italy. In fact, Greek and even other languages were heard on the Roman stage; Caesar and Augustus let 'actors in all languages' appear. At Nero's festival of the *Juvenalia* in 59, 'nobility nor age nor past offices excused any one from appearing as a Greek or Latin actor'. But it is not certain

whether entire Greek dramas were played, which is possible, or semi-dramatic, semi-musical recitals of Greek texts. Further, vocal recitals from tragedies subsisted down to the time of Justinian at least, when they wearied the audience. Choricus mentions scenes from the *Orestes* and the *Medea*, and says a good voice was of far more consequence in a tragedian than in a mime.

Pantomimic performances on the stage attained to far greater significance. Pantomimic action had long been regarded as a more important means of representation than recitation and song, for, in the drama, the actor, having to renounce either acting or singing, left the singing to the vocalist who did not act, and expressed the meaning of the poetry himself. As masks were worn, play of countenance had to be effected by action; and the use of gesture was ampler, finer, more cultivated and vivid than to-day, as numerous references prove, and the livelier gesticulations of Southerners. And in the cosmopolitan population of Rome, this form of language was universally comprehensible, and hence was favoured by the stage, which it soon monopolized.

Dramatic dance was developed into an independent art under Augustus about 22 B.C. by Pylades, the Cilician, and Bathyllus of Alexandria. Their most famous rivals were Nomius the Syrian, Hylas the Carian from Salmacis, Pierus of Tibur and one Gaius Theoros, who, in an inscription recently unearthed, is called 'the light and conqueror of the pantomimes, who enchanted even the God (the Emperor); how should men hesitate to follow the god?' This new specialization was restricted to tragedy; the pantomime replaced expiring tragedy, and comic pantomime fell into disuse. The practice was to link together the sensational moments in a series of lyrical solos, acted by a single pantomime, who acted several parts in succession, male and female, whilst the text was sung, not as in the drama by a single vocalist, but by a chorus. The text-books of pantomimes sometimes were original, but more often adaptations from Roman and Greek literature. Great poets even condescended to write such *fabulae salticae*; Lucan is said to have written fourteen. The pantomimes paid liberally for them. Statius received nothing but praise for his Thebaïs, but a large sum for selling an unknown text for an Agave to Paris, the celebrated dancer. Generally,

however, and probably rightly, such texts were regarded as worthless. Plutarch says that dancing was associated with second-rate poetry only, and therefore held sway in senseless, uncritical theatres, but was spurned by all intellectual and lofty-minded men. The subjects, being borrowed from tragedy, were nearly all mythological, very seldom historical. True, Lucian says the history of the world from the beginning down to the death of Cleopatra—a limit no poet under the Empire might transgress—was grist for the pantomime; but the tragedy of Polycrates and his daughter, and Seleucus' passion for Stratonice, his son's bride, are the only historical subjects he mentions, excepting the death of Cleopatra; no such subjects are mentioned elsewhere, whilst the number of the mythological known is very great. A few themes were taken from Roman legend, from Virgil a Turnus, in which Nero was to appear, and a Dido pantomime (also after Virgil), popular on the stage as late as Macrobius, and a few from Egypt, such as the story of Osiris, and the Transformation of the Gods; but Greece was the source of nearly all the legends, some of which may have been first dramatized in this form. Subjects of deep tragedy were utilized, such as Atreus and Thyestes, Ajax, and Hercules *furens*, Niobe, Hector. But the favourite selections were love-stories, some of doubtful morality, from the divine cycle, the adventures of Jupiter, Venus and Adonis, Venus and Mars enmeshed by Vulcan, Apollo and Daphne, and so forth; or from the heroic tales, Phaedra and Hippolytus, Meleager and Atalanta, Protesilaus and Laodamia, Jason and Medea, Achilles at Scyros, Achilles and Briseis, Ariadne at Naxos, Pasiphae, Cinyras and Myrrha; Cinyras and Myrrha was acted at the feast given by Caligula on the day of his murder, and the abundant blood that fell from the suicide hero was taken as an omen of the Emperor's fall. Such subjects, during the whole of the Empire, were acted by pantomimes on every stage, and drew the best audiences.

The *libretto* of pantomimes was derived from tragedy, or was in form tragic, but unity of place must have been preserved, and no change of scene made necessary; at least, there is no mention of such a change or other scenery, which must have been as simple as in tragedy. The choir, besides singing the text, may have sung in the intervals, as the performance, like the *récitative* in a modern oratorio, must have had some

continuous story, and thus the dancers would have had time to change mask and costume. Pylades in 22 B.C. introduced a chorus in the stead of the single tragic vocalist, and a rich orchestral accompaniment in place of the simple flutes. In reply to a question what his novelty consisted in, he quoted from Homer : ' Ἀὐλῶν συρίγγων τ' ἐνοπὴν ὁμαδὸν τ' ἀνθρώπων ' ('the sound of flutes and pipes and the turmoil of men'). In this orchestra there were flutes and *σύριγγες* and cymbals, *citharæ* and lyres, and time was kept by a *scabellum*, an instrument consisting of two plates bound together and attached to the sole of the foot, which were clanged together at the start. The music was of course also intended as a guide to the dancer's movements. This kind of music was no better than the usual texts; it was full of noise and trills, effeminate, undignified and unrestrained, intended to please the vulgar ear; and the more earnest connoisseurs thought the rule of the pantomime on the stage spelt the decay of music.

The increasing subordination of music and song to dance meant the increasing monopolization by the pantomime of all the interest. The dance might be made intelligible by the chorus, but the aim of the new kind of drama was to make dumb show self-sufficient, a task all the harder when a pantomime in the same piece had to play many various parts. He appeared, for instance, first as Athamas *furens*, and then as Ino the cowed; first as Atreus, and then as Thyestes, Aegisthus or Aërope, or as Bacchus, Cadmus, Pentheus, Agave, or as Hercules, Venus and Cybele in succession. He then had to act, so as to impress the imagination with an idea of the whole, and of the other characters, and their relations to the part he was playing; thus, whilst acting Achilles he had to suggest Paris, or Vulcan when acting Prometheus, or Jupiter, when portraying Ganymede. Demetrius, the Cynic philosopher, who lived under Nero, once spoke slightly of the pantomimes, as being ineffective without chorus and music, but the principal pantomime of Rome at that time, probably Paris, convinced him to the contrary, by dancing before him the adultery of Venus and Mars. His dumb show so effectually expressed the sun-god informing the deceived husband, the device of Vulcan and the invisible fetters, Venus' shame, Mars' entreaties, and all the other gods summoned by Vulcan, that the philosopher admiringly admitted his error. In the

Achilles at Scyros the artist acted the maidens spinning and weaving, Achilles in a woman's garb amongst them, made his audience see Odysseus enter, and hear Diomedes blow the trumpet, all unseen and unheard ; and in Achilles before the walls of Troy, made them see him hurling his lance in the turmoil, killing, fighting Hector and dragging his corpse, the fall of Troy, the death of Priam, the combats of Theseus, the labours of Hercules, and even the fight of the Centaurs and the Lapithae. 'A skilled actor', says Manilius, 'will dance every turn of fate into reality ; his gesticulation will follow the songs of the chorus ; and produce an illusion of seeing Troy and the fall of Priam'. Nonnus describes a contest in pantomimic dance between Bacchus' two companions, Silenus and Maro, and reproduces his impression of the stage. The subject of Silenus' dance is the contest between Aristaeus and Bacchus, to see which of them can provide the gods with the better liquor. Maro 'with silent hands' represents Ganymede handing the Gods nectar, and also Hebe 'in significant silence' filling the cups. Zeus is sitting as judge, Eros in the middle with the prizes, twigs of ivy and olive, in his hands. First, Aristaeus gives all the gods honey, but at the third cup they have had enough and refuse the fourth. Then Bacchus hands each of them a glass of wine, to Zeus first, then to Hera, then to Poseidon, and so to all in order ; all are exultant, except Apollo, the father of Aristaeus, who is depressed. And the more they drink, the more they ask for, and joyously award Bacchus the prize ; and Eros, half-drunk, crowns him with the vine-clad ivy. Cassiodorus, too, relates how the pantomime's hand expounds the song of the chorus for the eyes of the spectators, who can read the tale as if in writing. The same body can be Hercules and Venus, man and woman, a king or a soldier, a youth or an old man ; the actor seems to embody many persons at once.

Pantomimes regularly changed mask and costume for every new part in the same piece, except in one special branch of the art, the robe or cloak dance, in which every new rôle was signaled by a rearrangement of the same cloak, to represent, for example, 'a swan's tail, the hair of Venus Anadyomene, the scourge of a Fury', and so forth. This species of dance is very like the mimo-plastic acting of Mme. Händel-Schütz and of Emma Harte, the mistress of Hamilton, as described by

Goethe, and, probably, was a very exceptional exhibition of great skill.

Pantomimic art, capable of performing such tasks, is the more remarkable when we remember that the single dancer had no *mutae personae* beside him to represent other characters. But, had not ancient art and stage-craft made far greater demands on the spectator's imagination than the modern, such performances would have been incomprehensible. Further, under Augustus, occasionally two pantomimes appeared at once, each performing an independent part, but, whether this occurred on the stage is doubtful: at any rate, it is never again mentioned.

The pantomimic dance was not a dance in the modern acceptation; it consisted in expressive and rhythmic movements of head and hand, natural movements of the body, bendings and turns and even leaps. Nomius the Syrian, a rival of Pylades and Bathyllus, was censured for the slow movements of his hands, while his feet stirred too fast. Galen says that the strenuous exertions of dancers, the high leaps, quick turns, cowerings, and jerks, contraction and stretching out of the legs, like all violent exercise, strengthen the body. But such motions took place after the pantomimic dance proper, according to Nonnus, whose Silenus leaps up on one foot and then on both, stands on his right foot, and lifts his left up to his breast and shoulder, bends it round his back up to his neck, whirls round, bent over backwards, so fast that his head seems to circle on the ground. But this does not take place until he has concluded his clever pantomimic display with the hands.

This manual language, a common language, as Quintilian says, in the variety of human speech, evidently was richer in antiquity in significant and generally intelligible gestures than the gesticulations of modern Southerners. 'We admire professional dancers', says Seneca, 'because their hands represent every incident and feeling, and their gestures flow as fast as words'. Each new position of hand and finger expressed something fresh, and this 'eloquence of dance' was, no doubt, improved, refined and enlarged in the centuries of practice. Greek enthusiasts pretended that 'philosophic' dancers, Neopythagorean in their silence, were more eloquent than rhetors lecturing. But, of course, the hand was aided

by other supplementary movements. Mars, in Nonnus, dances 'eloquently silent with speechless hand : glancing on all sides ; weaving a picture of speeches with his artistic rhythms, swinging his head ; and he would shake his locks—were he not bald'. Thoughtful artists sought to express, through movement, the sense, rather than the words, and disdained to signify illness by feeling the pulse, or the *cithara* by a semblance of striking strings. Once Hylas, in a rehearsal, or at the school, expressed the words, 'Great Agamemnon' by standing tip-toe ; his teacher, Pylades, reproved him, for making him tall, and not great, and, whilst speaking, took up an attitude of contemplation. Throughout all ancient art tradition was far more constant than in modern times, and acted as a corrective against mistakes, and foolish attempts at originality ; and, in the pantomime, this same rule made acting easier to the artist, and to the onlooker, more intelligible. Lucian tells of one pantomime, who, when acting Kronos devouring his children, represented the banquet of Thyestes, and of another, who was performing the fiery death of Semele, but gave the idea of Glauke being consumed by Medea's venomous bridal dress. Such a confusion of rôles is unthinkable without a firm tradition for each part, and a quick perception of it by the audience. All descriptions confirm such a fine characterization in the better artists. Pylades was dissatisfied with one performance of the Blind Oedipus by Hylas, since he moved as though he saw. In affecting scenes pantomimes seemed to feel the sorrow of their characters and frequently moved the spectators to tears. 'Effeminate dancers', a Christian writer exclaims, 'inspire their simulated passion, cast aspersions on your gods, by representing them as lustful, sighing or full of hatred : their false pain and idle gestures call forth your tears'.

But, although the best actors owed their success to a representation achieved with much thought and grace and art, the charm they exercised on their audience was largely sensuous. Splendid bright garments with many folds, and a mask without the ugly tragic mouth-piece, enhanced the indispensable beauty of form ; according to Lucian, Polycletus' rule should be incarnate in the pantomime. The spectators never spared defects of outward appearance. A little dancer who was acting Hector at Antioch was asked : 'Where is Hector ? This

is Astyanax'; and a tall man preparing to scale the walls of Thebes as Capaneus was told, 'Climb over: you do not need a ladder'; a fat man, trying to do some high leaps, was told to 'spare the stage', and a lean man was wished better health. Antiquity required long curly locks in youthful beauty, and this was seldom absent. No doubt the art of the toilette was often called in to supplement Nature. Galen gives a recipe of a good depilatory, ascribed to Paris, a pantomime and favourite of Lucius Verus.

Incessant training and careful diet, especially abstention from rich food, secured the pantomimes full command of their bodies, and a pliability, elasticity and readiness, by means of which every movement could be graceful, elegant and effeminate. These qualities made them especially successful in feminine rôles, in which they almost lost their sex. Apuleius says of his step-son's father-in-law, whom he reproaches for vice and lust of all kinds, that he was so pliable in his youth, as a pantomime, that he seemed to have no thews and sinews, but his acting was untrained and inartistic. In the lewd scenes, which were the spice of this drama, seductive grace combined with luxury and shamelessness knew no limits. When Bathyllus, a beautiful boy, was dancing Leda, the most impudent actress of mimes felt like a mere country novice on seeing such mastership in the art of refined sensuality.

Pantomimes were generally accused of immorality and evil influence, and their most zealous protagonists could not rebut the imputation. Even young men naturally austere avoided them. Ummidia Quadratilla (who died in 107 A.D. almost eighty years old) owned pantomimes, in whom her interest was keener than it should have been in a lady of her rank. Her grandson, a severely moral young man, never saw them either on the stage or at her house. She sent him away when she wished to enjoy their performances, as much from respect as from affection for him, according to Pliny the Younger. It might have been presumed that the pantomimes essentially contributed to the demoralization of women, who were passionately addicted to the spectacles, even without Juvenal's lurid description. Julian, who abandoned the idea of the purification of theatrical performances as impossible, required the priests to abstain from seeing or receiving actors or pantomimes. Zosimus, one of the last heathen historians

of the Empire, read into Augustus' introduction of pantomimes, at the beginning of the monarchy, the beginning of a general moral decay of the world. St. Augustine, on the other hand, ascribes the invention of pantomimes to the far-seeing guile of the devils, who sent this more destructive plague, which they loved, into the world, to replace the Circus, when the world should grow weary of it.

There were two main classes of pantomime, ascribed to the two first artists, Bathyllus and Pylades. Pylades, who also wrote on his art, was the founder of tragic pantomime, Bathyllus introduced a simpler, merry species, allied to the burlesque *κόρδαξ* of the Greek and the older comedy: the subjects were lascivious travesties of the myths of the gods, as were found in the Old and the Middle Comedy, and also direct parodies of Tragedy. Echo, Pan, a Satyr inflamed by Eros were the favourite parts of Bathyllus, who had as little aptitude for the pathetic and solemn pantomimes of Pylades with their many characters, as Pylades had for lighter dance. As Bacchus, Pylades entranced the spectators most of all; he seemed, says a Greek poet, the god re-incarnate on earth; or, according to another writer, had Bathyllus then ascended to Olympus, Juno would have acknowledged him her son. As *Hercules Furens*, he is said to have exaggerated the madness of the hero. At Pompeii, there is an inscription of one of the highest officials, who was giving for a festival of Apollo, spectacles with every kind of music and recitations (*acroamata*) 'with all the pantomimes and Pylades': hence he seems to have toured through the cities of Italy, no doubt for a high fee. Both artists founded schools, and later exponents of the art took their names, a habit common among artists of the time. Bathyllus' school maintained its ground, as late as Plutarch at least, but was early thrust into the background by the followers of Pylades, who soon had absolute control of the stage: Lucian in his exhaustive essay *περὶ ὀρχήσεως* (On Dancing) only mentions the tragical variety.

The pantomime was not the only orchestral performance on the Roman stage. Not only songs occurring in tragedy were acted by pantomimes or accompanied by pantomimic dances, but other poems were also set to music, and the singers might be their own accompanists.* Ovid's poems were thus acted, though not intended for the theatre, and his exile was

cheered by news of the success of his poems danced on the stage : thus, to the irritation of more austere critics, panegyrics on the Emperors were sung on the stage to effeminate dances, and actors who aimed at a nerveless overdelicacy of expression, boasted that their speeches could be sung and danced. A kind of ballet, an interlude called *embolium*, was in whole or in part danced by women.

Besides the pantomime, only one other stage-dance is at all known, the Greek Pyrrhic. The name signifies a Doric war-dance, which survived late at Sparta : under the Empire there were several species of the Pyrrhic, of which the best was practised in Ionia and other provinces of Asia Minor, and there publicly performed at festivals by children of the noblest houses. Such boys were often summoned by the emperors to Rome, and, after their performance, granted the *civitas* : but slaves, and imperial slaves especially, were also trained in it. Possibly, there were Pyrrhics to be danced by boys only, and by boys and girls together ; the latter, probably, only by slaves or professional dancers. The Pyrrhic dancers appeared with wreaths, and in gorgeous gold-embroidered tunics, and purple or scarlet cloaks. New groupings, involutions and disentanglements followed one another ; they formed circles, rows, disorderly masses, and squares. There were also mock fights with wooden weapons between dancers of the two sexes, but chiefly dances of a Bacchic or similar nature. The dancers acted the parts of Titans, satyrs, corybants, shepherds, and as bacchantes brandished *thyrsi* and torches. These dances might easily be made dramatic, to represent the adventures of Dionysus in India or the story of Pentheus¹ : but other myths were also chosen, e.g., at one festival of Nero's the story of Pasiphae was performed in the amphitheatre as a Pyrrhic : on that occasion Icarus fell down from a flying-machine, and sprinkled Nero with his blood.

Apuleius, evidently as an eye-witness, describes such a mythological Pyrrhic at a festival in Roman Corinth : it seems very much like a modern ballet. It was preceded by a simple Pyrrhic. The staging consisted of a lofty wooden Mount Ida, planted with live trees and bushes, with descending streams ; and Paris, a beautiful boy in a barbaric dress and a golden tiara, is herding some goats. Mercury, a beautiful fair boy, with only a *chlamys* on, and staff and caduceus in hand, and

golden wings on his head, enters dancing, and hands Paris a golden apple, telling Jupiter's command by gestures. Then Juno steps in, a fine woman with diadem and sceptre, and Minerva rushes in after her, with a bright helmet, wreathed in olives, swinging her shield and lance ; and last, Venus, naked, save for a transparent blue silken pallium round her hips. Juno, who is attended by Castor and Pollux, first expresses by dance to the flutist's accompaniment her bribe of sovereignty over Asia. Minerva, attended by the daemons of terror and fear, who dance a sword dance naked, promises in wild rhythmic steps, set to a warlike Doric measure, a warrior's renown. Lastly Venus, amid loud applause, steps on to the middle of the stage, with a troop of Cupids with wings, bows, and torches, and of maidens who represent the Graces and the Hours. The flutes play a soft Lydian measure, to which Venus dances a seductive dance (' sometimes seeming to dance only with her eyes ') and promises Paris the fairest lady on earth. He hands her the golden apple : Juno and Minerva express anger and scorn as they go off, and Venus and her train perform a last triumphal dance. Then from the top of Ida a fountain of crocus and wine springs up high, fills the theatre with fragrance ; and the mountain sinks out of sight.

But the pantomime found more favour on the stage under the Empire than any other kind of dance or play. The extent to which it superseded all others, is shown in that the word *histrio* (' actor ') came to mean specially a dancer. Philostratus, writing under Commodus, says this was the usual form of play, eagerly visited by senators and knights. But this preference for the pantomimes is least marked at the bottom of the social scale. The lower classes enjoyed the coarse obscenities and farces of the mimes, which the lovers of pantomime despised. For pantomime demanded a certain measure of knowledge of mythology and a very great sensibility to the fine points of acting : and was best fitted to reanimate nerves exhausted with pleasure. In the higher society of Rome the passion for pantomime spread : Seneca the Elder speaks of this ' disease ' ; according to Tacitus it was one of the congenital evils of birth in Rome : women were the most subject to it. Public exhibitions were too few to satisfy its lovers ; and even in the Early Empire every great house included in its slaves and freedmen pantomimes and other stage-dancers

of both sexes ; and some female pantomimes were so much the favourites of their masters that they received a million sesterces as dowry.

In 15 A.D. the Senate decreed that pantomimes might only be seen publicly, but this soon became a dead letter : Domitian forbade a public appearance and expressly permitted their performances in private houses. Such a general infatuation necessarily led to dilettantism in dancing, however opposed to Roman ideas of decorum. Even in the late Republic, this dilettantism was so common that men of noble birth and high position were scoffed at for their love of dancing and their skill in it. Such were Cicero's friends, Marcus Caelius Rufus and Publius Licinius Crassus, the son of the triumvir, and his opponent Aulus Gabinius (consul in 58 B.C.) : Gabinius' house, says Cicero, re-echoed with cymbals and songs, and he even went so far as to dance before his guests without his upper garment. Lucius Afranius (consul in 60) is said to have been a better dancer than statesman. Under Augustus good dancing was essential in society, and the cultured in reality or semblance strove after proficiency in it. Ovid advises the lover at a feast, where he is with his lady, to dance with her, if his arms be flexible ; an importunate man, who is worrying Horace for an introduction to Maecenas, recommends himself as a good dancer. Manilius reckons a genius for dancing, the art of song and the lyre among the accomplishments of the merry spirits who prevail by grace and delicacy. Soon complaints arose that these unmanning and unseemly exercises injured the more serious studies of youth. Caligula's passion for dancing increased this dilettantism. Good teachers of dancing and music were in great request ; and, though they were mostly freedmen foreigners, under Augustus a Roman citizen for the first time gave instruction in dancing. Seneca says that the art of Pylades and Bathyllus found numerous teachers, and that nearly every private house had its stage, which echoed to the feet of men and women. And for subsequent times there are many proofs of the continuance of the passion : Lucian states that a dancing-master was a regular part of the personnel of a great house. And, although for eminent men to dance was always considered unsuitable and indecorous, some of the emperors even are said to have been skilled performers.

This lofty patronage by rank and rulers of stage-plays affected the social, if not the legal position of actors. Civil *infamia* was still the lot of all who performed in public for the amusement of the people, as it was of a soldier dismissed in disgrace, the pandar, the convicted thief, the swindler or calumniator. Diocletian apparently was the first to pronounce that minors who went on the stage should not become 'infamous'. Disability from any office attached to actors in the *municipia* and the provinces. With the son or daughter of an actor or actress the agnate grand-children and great-grand-children could not contract a valid marriage. A husband who detected an actor in his own house in adultery with his wife, might kill him legally, like his own slave or freedman. A soldier who went on the stage was punished capitally as though he had sold himself into slavery. Officials used to be entitled to flog actors arbitrarily: Augustus restricted the right to the time of duration of the plays and the limits of the theatre: and thus the law remained. Further, Augustus was relentless against actors who offended against morality. He had the comedian Stephanio whipped in three theatres at Rome and banished him, for having relations with a married woman, who had waited for him dressed as a boy with clipped hair. Hylas the pantomime was on a praetor's report publicly flogged in the *atrium* of his house; and even the famous Pylades was banished from Italy for pointing his finger at a spectator who hissed him.

Naturally, an infamous profession would generally be entered on only by slaves and freedmen, or free men from countries which did not feel the Roman prejudice, namely, Greeks, Asiatics and Egyptians, a circumstance which did not enhance an actor's reputation. Further, even in Greece, they were none too well spoken of. Gellius tells of a pupil of Taurus the philosopher, a rich young man, who liked the company of tragedians, comedians and flute-players, and notes for his Roman readers that these were free men. Taurus recommended him to cease this intercourse, to read an extract from Aristotle every day: for Aristotle ascribed the immorality of most Dionysian actors to the fact that their art withdrew them from philosophy, and that they alternated between misery and debauchery—both roads to ruin. At Rome, under the Empire, pantomimes, comedians, tragedians and actors were

part of a great household, singly or in troops : for a tragedy not only three actors were required, but *mutae personae* were also needed : hence Martial can speak of a troop of young comedians who were all so charming that none would do for Menander's 'Hated Man', but any of them for his 'Twice Deceiver'. The imperial household had the best and the largest number. Actors, like slaves, were transferable by bequest, gift, or sale, and served to entertain their master and his guests at table : they were also used for public exhibitions, let out and hired, and were a good investment, after their education had been paid for. Friends and flatterers never missed the theatre, and zealously applauded if the great man's slaves were acting. Often their skill earned the slaves their manumission, or the public interceded for them. But, at manumission, they pledged themselves to serve their patron on certain conditions, to hire themselves to him, and to appear without any fee at any play of his or his friends.

But, in spite of this general disrepute, some few pre-eminent actors attained very high positions. Under the Republic, Roscius and Aesop had thus risen ; both amassed great wealth, and Roscius was granted the golden ring by Sulla, as was Herennius Gallus by the Younger Balbus, when Quaestor at Gades. And at a time when plays had far more importance, and Greek manners and thought had diminished the prejudice against actors, whilst the upper classes were infatuated with the stage, great talent found the road easier to great position. The difference between the position of a great and a humble actor was much greater than now. Many an Agamemnon or Creon, magnificent on the stage, and decked with purple, lived on a monthly ration of bread, receiving some small pay, if well received, or even whipped, if hissed (as often happened). For, even in Cicero's time, the public was sharp enough to detect any false note, any fault of time or rhythm in delivery and gesture, and manifested its disapproval in hisses, stamping and outcry. But the few sovereigns of the stage moved in the highest society, were wealthy and influential, and saw nobles and noble ladies striving to gain their favour. 'Comedians and pantomimes', says Plutarch, 'who succeed on the stage, are admired and envied by free men and even by the nobly born'.

Naturally, prominent actors were awarded recognition and

honour by their colleagues: they used to hold the offices of honour and the priesthoods in the societies and guilds of actors, especially the so-called sacred synods. And the cities where they acted lavished on them inscriptions, statues, and even municipal distinctions. Roman towns were less generous in this respect than Greek cities, which squandered their franchises on travelling actors, as Cicero says of Rhegium, Locri, Naples and Tarentum. Yet the 'most famous, cities of Italy' were not ashamed to confer the *insignia* of *decurio*, *duumvir* or even higher honours, such as the augurate, on a pantomime who could arrogate the conventional title of the 'first of his time'. In the little town of Bovillae, a director of a troop of mimes, who was both a comedian and a tragedian, was made *decurio*, despite the legal disability of actors to hold city offices, and at the solemn inauguration of a statue set up to him by the Guild of Mimes in 169 he distributed largesse to all the inhabitants.

Famous actors received high fees for performances (in 15 A.D. a legal limitation was found necessary), and also gifts from the providers of festivals, who vied with each other in ostentatious generosity; their extravagance had to be restricted by law: Marcus Aurelius decreed a maximum of ten pieces of gold for such gifts: but such legislation must have failed. The prizes of the victors in the actors' competitions were also in money or valuables, golden wreaths—or copper wreaths, stained with ox-gall. Vespasian at the spectacles at the rededication of the theatre of Marcellus, gave every single actor as much as 40,000 sesterces, a number of golden crowns, and to Apollinaris the tragedian 400,000. The favourites to whom Nero is said by Plutarch and Suetonius to have dispensed 2,200 million sesterces (about £23,925,000), were all actors and athletes. Galba demanded the return of nine-tenths of this sum: most of it must have gone to the actors. Hence actors, if popular and famous, amassed great wealth. Pylades accumulated so much, that in his old age (2 B.C.) he himself provided spectacles at Rome: a later Pylades, who lived under Commodus, is famous for having given at Puteoli gladiatorial games and *venationes* on a very large scale. Pliny the Elder says that the highest price (700,000 sesterces) recorded for a slave, Daphnis the grammarian, was easily surpassed by the annual income of a pantomime who had purchased his freedom,

probably referring to Paris. Vitalis, the mime, on his tombstone states that his art brought him fame throughout Rome, reputation, a stately home and wealth. At Constantinople prominent actors earned large sums : according to Choricus, the mimes with universal fame went about in costly clothing, had well-filled pockets, silver plate and numerous slaves.

As already said, the most famous actors often belonged to the imperial household, and thus enjoyed general respect, and, the pantomimes especially, the favour of the emperors and empresses. For some time Apelles the tragedian found favour in the eyes of Caligula, and after his death, Mnester, the beautiful pantomime, whom he passionately loved : Mnester also was a forced lover of Messalina, who withdrew him from the theatre and had the coins of Caligula melted down to mould statues in his honour : he and she were executed together in 48 A.D. Paris, the pantomime, was the boon companion of Nero's debaucheries, and stood so high in his favour that he not only ventured to accuse the empress-mother, but escaped the punishment meted out by her to her other accusers. He demanded back from Domitia, the paternal aunt of the emperor, the sum of 10,000 sesterces which he had paid for his manumission, on the plea that she had not legally owned him ; and the emperor's intervention won him his case (56 A.D.). Eleven years later (67 A.D.) Nero had him executed, as he himself, desiring to excel in the art of dancing, feared a rival in his former teacher. Amongst Domitian's favourites was Latinus the mime ; another pantomime, the most famous of his time, who called himself Paris, after the stage convention, had relations with Domitia the empress, and was executed ; and rumour connected the murder of Domitian with some other liaison of hers with a pantomime. Probably during his reign, Juvenal was banished for a certain passage in his Satires in which he says that the support of a dancer is more effective as an introduction for a post, civil or military, than that of any great man ; this being read as an allusion to a pantomime then in high favour with the Court, whose protégés had frequently been promoted. Trajan, too, a great friend of all spectacles, loved a pantomime Pylades. Antoninus Pius 'loved the art of the pantomimes'. Amongst the freedmen who ranked high at the luxurious court of Lucius Verus, there were no less than three pantomimes ; these were Memphis

or Apolaustus (really Agrippinus), whom the emperor had brought back from Syria, Paris (really Maximinus), and another Pylades: and some whom city gossip spoke of as lovers of Faustina were pantomimes. Caracalla made Theocritus the dancer commander of the Armenian legions.

Hence, not unnaturally, the society of actors was sought after even by the upper classes. There was a useless *senatus consultum* of 15 A.D. forbidding senators to visit the house of pantomimes, and knights to form their escort. Under Nero men and women eagerly thronged to accompany them: young noblemen behaved like their grooms: city rumour said much of immoral relations between them and prominent persons: under the successors of Nero the greatest crowd followed them, and, under the Antonines, many regularly passed some part of the morning with pantomimes or charioteers. On the spot where Paris, executed by Domitian, fell, many of his admirers strewed flowers and poured forth fragrances, and Martial wrote his epigram: 'Wanderer on the Via Flaminia, do not pass by this noble marble monument. The delight of Rome, the wit of Alexandria, art, grace, merriment, joy, the glory and the grief of the Roman stage, and all the goddesses and gods of love lie here buried with Paris'. And ladies of high station were reputed to be susceptible to the charms of the actors, and to bid high for their favours.

As a result of this universal, intense interest in the stage and the actors, the rivalries of great artists necessarily led to theatrical factions; the more so, as of old competitions were customary, with palms, wreaths and other honours as the prizes. Even in Republican times actors organized a *claque* to secure this party attachment. They aimed at getting as many influential adherents as possible, paid their applauders well, distributed them in the crowd, and tried to gain popular favour through professional clappers. The instigator of the revolt of the Pannonian legions in 14 A.D., Percennius, was a soldier, an insolent agitator and skilled demagogue, and trained in early life as leader of a *claque*. Under the influence of the Circus factions and of distinguished sympathizers, including even the emperors, these theatrical parties were further developed; their attempts to terrorize and suppress each other led to bloodshed and scuffles in the theatre, despite the presence of a cohort (1,000 men) of the

Guard, and the frequent banishment of the actors, and punishment of their adherents. This disorder spread from Rome to the provinces. The imperial procurator of Epirus complained to Epictetus that he had been insulted in the theatre by the opponents of a comedian Sophron, whose side he had, however, taken, perhaps too warmly. He had shouted, risen from his seat, and his slaves likewise. How then, says Epictetus, could he wonder that, if he behaved like the mob, they treated him as one of themselves? And in the provinces it was the *collegia juvenum* who were most concerned in these scenes of disorder. Callistratus the jurist, writing under the Severi, says that people, calling themselves young men, regularly join in the tumultuous applause of the public. If it be their only crime, and first offence, they need only be caned (a punishment for low-class free men), or forbidden the theatre; a second offence shall entail banishment; and hardened offenders, with whom gentler measures fail, are to be executed. Only pantomimes are mentioned as the cause of such factions and tumults, which proves how completely this kind of show overshadowed all others.

The historians, who ascribe due importance to these incidents at Rome, mention those of greater consequence, and the attitude of the emperors. The rivalry of Pylades and Bathyllus in 17 B.C. caused uproars in the theatre; but Augustus was lenient towards the actors, as the causes, first, of diverting popular excitement from public matters, and also because Bathyllus was the favourite of Maecenas. In 15 A.D., at the festivals of the obsequies of Augustus, the rivalry of the pantomimes occasioned further disorder, but Tiberius, at the beginning of his reign, did not dare to inhibit the theatrical licence to which the people had become accustomed. But the following year a faction-fight in the theatre, incited by Drusus, led to scenes of tumult; the officials were disregarded; the Guard intervened, and, in the scuffle, several of the people and a centurion fell, and a tribune of the Praetorian Cohort on duty was wounded. The result was the *senatus consultum* empowering the praetors to inflict banishment for breaches of the peace. But disorder still continued, and the praetors were powerless; in 22 or 23 Tiberius had to decree exile from Italy against actors, guilty of exciting these tumults, or of other crimes, and especially against the pantomimes; and he was

deaf to any popular petition for their recall. Caligula permitted the actors to return at the very beginning of his reign, and under him and Claudius no decrees against theatrical disorder are heard of. In 55 Nero dispensed with the Praetorian Cohort on duty, ostensibly to withdraw the men from the temptations of the theatre: consequently faction-fights became more violent, especially as Nero incited the combatants by promising impunity and rewards, and took sides, first secretly and then openly; at one fight, when stones and broken benches were being hurled about, he eagerly joined in the fray, and wounded a praetor in the head. Then it seemed again the Guard was indispensable; the pantomimes were once more banished from Italy: the ringleaders were imprisoned by the praetors, and the attempt of a *tribunus plebis* to hinder this unpopular measure was foiled by the Senate. But very soon after, about 66 A.D., pantomimes were again allowed. Titus sternly refrained from applauding even his favourite pages, who were the leading dancers of the day. Domitian prohibited any public appearance of pantomimes; Nerva restored them at the earnest request of the people. Trajan at the beginning of his reign again forbade it, but removed the prohibition after his Dacian triumph of 107 A.D. Hadrian, and after him Alexander Severus, made Court pantomimes a public service. Lucius Verus especially favoured pantomimes. Prohibitions occur in the second century, but not afterwards; probably in those times of growing degeneracy, with the theatres absorbing all public interest, they were not issued.

IV. THE STADIUM

The athletic and musical contests of Greece were the last to acclimatize themselves at Rome. Not common under the Republic, with the gradual amalgamation of Roman and Greek culture and manners, they became popular under the Empire. Here we shall only speak of the athletic contests. This spectacle, like the *venationes*, was first introduced in 186 B.C. by Marcus Fulvius Nobilior, when many performers crossed over from Greece for the purpose. One hundred years later, Sulla at his triumph over Mithridates (81 B.C.) exhibited athletes at Rome in such numbers, that at Olympia only foot-

races could be held, for want of competitors in other contests. The example was followed by Marcus Scaurus in 58 B.C. in his aedileship (probably on an unheard of scale, since Valerius Maximus erroneously makes him the first introducer of them), and by Gaius Curio at his father's funeral (53 B.C.), and Pompey, at the dedication of his theatre in 55. But the feeling of most Romans is well exemplified by Cicero, who, writing to Marcus Marius, says he will hardly be keen on the athletes, as he disliked *even* gladiators; and Pompey admitted he had spent 'trouble and oil' in vain. But in 46 B.C. Caesar at his triumphal games set athletes fighting for three days on a stadium temporarily erected on the Campus Martius.

Augustus was extremely interested in these exhibitions, and also instituted contests of athletes, 'collected from all parts', on the Campus Martius, twice in his own name, and once in his nephew's. He was the first to ensure not only frequent but also regular contests. As a perpetual celebration of the victory of Actium he renewed and extended the festival of Apollo, there celebrated from of old: he founded the city of Nicopolis, and instituted gymnastic and musical contests at intervals of four years, probably on the anniversary of the victory (September 2): for athletes, after the *Augustalia* at Naples, used to go to Nicopolis. Augustus was present at the Augustalia, shortly before his death (August 19). The *Actia* became a fifth sacred contest of Greece, and, in the Early Empire, dates were sometimes reckoned by Actiads as well as by Olympiads; and these contests subsisted until very late, and ranked high. Julian restored them. Numerous inscriptions of athletes and musicians from the most various Greek-speaking lands, prove that the honour of victory at the Actiads was as great as that of the wreath of Olympia and Delphi. Similar periodical festivals were set on foot in honour of Augustus by princes like Herod of Judaea in 8 B.C., and, in many provinces, besides temples and altars, nearly every town held Augustal games.

At Rome, immediately after the Battle of Actium (31 B.C.), the Senate decreed a quadrennial festival to celebrate the victory, which was held for the first time under the presidency of Agrippa in 28 B.C., the year in which the Palatine temple of Apollo was dedicated. These games 'for Caesar's prosperity', and sacred to Apollo of Actium, were henceforth given every

four years by the consuls and the four great colleges of priests alternately, but only up to the death of Augustus ; the last celebration mentioned is in 9 A.D. At the games in 28 B.C. noble men and boys handled the chariot, as in the sacred games of Greece, and a stadium was specially erected in the Campus Martius for the athletes ; and a gladiatorial contest was also given. The festival lasted several days ; Augustus was ill, and on some of them Agrippa presided. Without doubt athletic games were a feature of subsequent celebrations. At a festival given by the *pontifices* the people demanded a boxing-match ; Augustus postponed it until the next day, and forbade women to come in before the fifth hour. He endeavoured to exclude women from athletic spectacles altogether.

Their greater frequency made athletic games popular, and soon the people demanded ' Greek contests ' from the officials who provided the State games and paid as much regard to such desires as did the emperors. Caligula gave gymnastic games at Rome in 38, and simultaneously at several places in 39 on Drusilla's birthday ; Claudius at the British triumph in 44 A.D. varied the chariot-races in the Circus with athletic contests. But it was Nero's love of Greek manners that contributed more to popularize these games at Rome. In 60, he instituted the first ' holy ' festival after the Greek model, with three kinds of contests, chariot-racing, gymnastics, and singing, music, poetry and oratory ; the festival was to be quinquennial and the cost to fall on the exchequer. The contest of chief importance was the musical competition, which had been lacking in the Roman games of the Actian Apollo, and the idea was due to Nero's desire to shine as a poet, singer and cither-player. It was celebrated in the theatre under the presidency of consulars, with distinguished Romans taking part in it and following the emperor's example. The victors were wreathed. At the first celebration the gymnastic contests were held in the *Saepta*, and the Vestal Virgins invited, because at Olympia the priestesses of Ceres were the only women allowed in. But the emperor, about the same time, annexed to his *thermae* a *gymnasium*, and, at its dedication, distributed oil to the Senate and the Knights, a plain hint to the upper classes to take part in these contests. But opponents stigmatized it as the utmost degradation to nobility, to bare the body, put on boxing-gloves, and exercise themselves in such contests, instead of in arms.

This took place once. One Palfurius Sura, the son of a consular, a talented but morally irresponsible man, appeared as a wrestler, and once, so rumour says, wrestled with a Spartan maiden. This tremendous insult to Roman feeling found no imitators. During the festival many assumed Greek dress. After the second celebration in 65, and its continuation in 66, the Neronea are no more mentioned, and perhaps were abolished after Nero's death. Gordian III restored and extended them, probably in 240, before setting out on his Persian campaign of 241; this was the 36th celebration of the Neronea. Thenceforward the festival was called the 'contest of Minerva'.

In 86 A.D. Domitian instituted the Capitoline Agon, which ranked with the Olympian, and obtained a far greater and enduring importance. This was also quadrennial, and held in the early summer, so that competitors might come from beyond the sea; the three main species of competition were the same, and the prize a wreath; Domitian added a few unusual contests, which soon ceased. Thus the competition in Greek and Latin oratory lapsed, but the unique prize for Greek and Latin poetry was a poet's highest ambition throughout the Empire, and the hope of receiving the oak-wreath from the emperor's hand, after the judicial pronouncement, brought the most talented poets from distant provinces beyond the seas to Rome. The memory of these coronations of poets on the Capitol lasted down through the Middle Ages, and Petrarch was proudest of his coronation by the Senator of Rome. In the musical competitions, originally there was only a contest of solo and chorus citherists; later in singing and in cithar-oedic (singing accompanied by cithers), and the Pythian solo flute, and also flutes in orchestra; possibly also, in dramatic representations. For these musical performances Domitian had a covered theatre, the Odeum, built on the Campus Martius by the famous architect Apollodorus, which was considered one of the loveliest buildings of Rome, as late as the fourth century.

The Capitoline Agon consisted of the same gymnastic contests for men and boys, as in Greece; the races for girls, introduced at first, after the Spartan custom, soon fell into disuse. Naturally, as a rule, competition was left mainly to Greek athletes, whose numerous extant memorials boast of the wreaths of victory. One Titus Flavius Archibius won in

four successive Capitoline Olympiads (94-106 A.D.), the first time in the boys' *pancratation*, and three other times in that of the men ; and Cassius Dio, the historian, mentions that Aurelius Helix the athlete was victorious (in 218) both in the wrestling and the boxing at the Capitoline *agon* : a feat achieved only by seven champions since Heracles at Olympia, and at Rome by none before. Domitian built a *stadium* for athletes on the Campus Martius, capable of holding 30,000, or 33,000 spectators : remains of it were still visible in the Middle Ages, and the name Piazza Navona (Campus Agonis) still preserves its name and form. The Greek character of the entire festival was outwardly preserved under Domitian, if not afterwards. The Emperor presided in a Greek purple mantle and in Greek shoes, wearing a golden crown with images of the three Capitoline deities, Jupiter, Juno and Minerva : the assessors and judges were the *flamen* of Jupiter and the College of Priests of the Flavian House in the same dress, except that the emperor was also depicted in their wreaths. Later the priesthoods, under the presidency of the Emperor, had the alternate conduct of the contests. The general assemblage was the most brilliant audience in the world for any athlete, artist or poet. These Games survived down to the very end of antiquity.

Other contests, perhaps exclusively athletic, were founded by different emperors, e.g., a Feast of Hadrian, instituted by Antoninus Pius ; Games of Hercules in honour of Alexander the Great, probably under Caracalla, which were celebrated as late as Alexander Severus ; the Agon of Minerva of Gordian III, and the quadrennial Feast of the Sun-god, founded by Aurelian in 274. A Greek athlete boasts in his inscription of having beaten the Romans in running, and in the stadium, as well as in the double course at the contests of the Sun-god, the Moon goddess, and Hercules, and of having won prizes and wreaths at them all. At the millenary festival of the city under Philip the Arab in 248, athletic contests besides others were held. Cyprian, Bishop of Carthage (who died in 257) writes : ' Men practise for the race at the secular festival and account a wreath received in presence of the people and the Emperor as great fame '. In a Greek anecdote, a school pedant consoles an athlete who has failed in the contest : ' he will win at the next millenary *agon* '. Of all these *agones* nothing

further is known ; none attained anything like the repute of the Capitoline. But, apart from them, under the Empire, especially in the third century, the appearance of athletes at Rome at spectacles of all kinds became no doubt more and more common. Thus Severus at his triumph summoned musical and gymnastic performers from all parts of the Empire, and the medals of this celebration, as those of Gordian III in 244, represent an athlete in the Circus ; the same too appears in the circus mosaic of the Circus at Barcelona. At the great games of Carinus, a thousand athletes performed, and were presented, like other Greek artists, with gold and silver and silk clothing. After the fifth century gymnastics replaced gladiators, if not before ; thus at the consular games of Flavius Mallius Theodorus we find athletes, but no gladiators. In the astrological work of Firmicus Maternus about 350 A.D. nativities of gladiators are far less frequent than of athletes, who are often mentioned with their masters as being in the service of great men.

The Greek *agones* met with a very hostile reception at Rome from true-spirited Romans, who objected to athletic contests, although some were customary in Italy and the West, and public exhibitions of wrestling, boxing, and pugilism had been seen at Rome. Boxing, a national mode of fighting in Etruria, Latium, Campania and Africa, was practised in Italy by whole troops at a time : one of the high officials of Pompeii under Augustus allowed Greek boxers to appear beside native ones on the forum. This pastime was always popular at Rome, at the time of Terence (whose *Hecyra* failed on its first appearance in 165 because of the superior attraction of boxing-matches), as well as in Horace's time, when the mob often asked for a bear or a boxer in the middle of a piece, 'following its own sweet taste'. But Italian contests must have been very unlike the Greek, especially in the lack of science and grace. Roman objections to Greek gymnastics were primarily moral, for nudity was considered shameful ; Cicero approves the sentiment of Ennius, that 'the beginning of shame is to strip before fellow-citizens'. Another ground was its practical uselessness : the exercises did not tend to make good soldiers ; lastly, the fear of the corruption of youth by the idle life of the gymnasia, which, so the Romans thought, had principally contributed to the fall of Greece.

But, despite this general disesteem, Greek exercises were so much in favour towards the end of the Republic that, as Varro complains, at least one gymnasium was an essential to every villa. These gymnasia served for curative exercise (*iatrialiptice*): Prodicus of Selymbria, a pupil of Hippocrates, had devised this cure, and, according to Pliny the Elder, thus got the rubbers and doctors' assistants an income. At a banquet given by Apicius, a notorious glutton, Junius Blaesus was present, and gymnastics were the staple of conversation; one fine old man of 91, Isidorus, was there, as it were to prove, as a hale and hearty man and skilled wrestler, its utility in prolonging life. Celsus strongly deprecates the use of this curative exercise for healthy people, for whom he considers any athletics inadvisable; but probably, like all Greek customs, it made more and more inroads. Trimalchio is accompanied to his bath by three masseurs.

Nero promoted Greek athletics the most vigorously, introduced them in an official festival, built a gymnasium, manifested his preference for them—on the day he received news of a rising in Gaul, he was an interested witness of performances in a gymnasium at Naples—and gave large presents to the athletes. He and his freedmen, Patrobius especially, copied the generals of Alexander the Great, and imported Nile sand; a cargo of it arrived from Alexandria during a famine at Rome and exasperated the people. The Emperor's example and the Court spread the fashion far and wide. Greek athletics now became the mode, and the art was declared by its teachers indispensable to perfect health and a perfect body, and was recommended as a part of the training of the young; conservative Society dreaded the importation of Greek depravity with Greek gymnastics. For the ancient morality, even then declining, would collapse before foreign licentiousness; every subject or object of temptation would be paraded, and the next generation enervated by gymnastics, idleness and disgraceful amours. And these ultra-conservatives, who regarded the Greeks as the original source of all evil, considered the introduction of gymnastics as part of the dietary of the healthy not only useless but immoral, and complained that young Rome was cultivating the body at the cost of the soul. Lucan, too, at the time of his disfavour with Nero's Court, expressed the same view strongly, and deemed 'the young man fresh from

the Greek gymnasium weak through sauntering on the wrestling-ground and unsuited for war'. Martial praises one Atticus for being content with simple running, and disdaining the waste of time in gymnastic exercises, whilst other young men gave themselves up to a teacher with cropped ears (often represented in pictures of boxers) and paid undeservedly large fees to a dirty rubber. Elsewhere he asks, why waste the strength of the arms on stupid dumb-bells? a better exercise for men would be digging in a vineyard. So too Pliny the Younger is grieved that the old Roman military drill under a veteran, decorated with the mural or civic wreath, is being superseded by gymnastic exercises, under the supervision of a Greek gymnast. Greeks, even, confessed that the Romans were corrupted by the Greek habit of nudity, but they repaid their teachers for the damage with interest.

When Domitian inaugurated the Capitoline *Agon*, introducing Greek games on the largest scale known, this opposition became very lively, and continued, even after the repulsive girls' race had been abolished. Once in a Council of Trajan on the question of abolishing an *agon* at Vienne, Junius Rusticus, a man of great probity and firmness, assented, and added, 'I wish they were to cease here as well'; and Pliny the Younger, who was also of the session, mentions this as a proof of intrepidity and decision. He goes on: 'It was decided to abolish the *agon*, which was corrupting the manners of Vienne, just as ours corrupt universal morals. For, if the Viennese have vices, they keep them to themselves; but our vices propagate, and in the empire, as in the body, disease is worst, if it start from the head and extend'.

This national disinclination towards athletics and Greek *agones* lasted at least up to the second century, and, at any rate, had the effect of making participation in them by members of the upper classes very rare, and by no means common amongst the lower. In the first century we hear of many knights and senators on the stage, in the Circus or the arena; but Palfurius Sura is the only man mentioned as appearing in the stadium. True, even in Rome meaner men took up the profession of athlete. In the 177th Olympiad (72 B.C.), a Roman named Gaius won the long race, and Titus gave the preference to pancratist Regulus. Martial was acquainted with one Liber 'who dealt Greek blows with an Italian hand', and obtained

the wreath for boxing, and Juvenal says that foreign manners have gone so far that the citizens of Quirinus carry 'wrestling prizes round their wax-besmeared necks'. But though Naples offered the best opportunity for a regular training in athletics, Italy produced mainly itinerant boxers, who, as Horace says, exhibited at village festivals and did not aspire to the Olympian wreath, while Greece and the East, as before, supplied the great professionals. For, whilst there are as many inscriptions of Greek athletes as of Roman charioteers and gladiators, there are hardly any of Roman athletes.

The Romans, then, were never as addicted to athletic performances as to others, but, after Nero and Domitian, there were many amateur athletes, even amongst the women. In Nero's time the friends of this art welcomed the 'latest athletes' and eagerly watched their feats; and, in the great households, there were regularly slave athletes. Such slaves often prescribed their masters' diet, and even taught how the legs should be moved in walking and the cheeks in chewing. Under Vespasian rich men decorated their wrestling-schools and grounds with statues of athletes. In Domitian's time, young men frequented the Greek exercising grounds; and favourite slaves and freedmen were sent to be trained in the *palaestra*; thus Atedius Melior sent his favourite, Glaucias. Quintilian, comparing the tricks of wrestling with an orator's tactics, exhibits considerable knowledge of the teaching of wrestling, which was mainly given by unsuccessful competitors in other branches. In Martial and Juvenal's time there were female devotees of the art, who often carried devotion further—to the performers, and sent them costly gifts; there were even amazons, who took to the hard diet of athletes, rubbed themselves with yellow sand, wrestled and practised with heavy dumb-bells. In the course of the second century, the utility of Greek athletics became more generally recognized. Hadrian, a versatile amateur, only went in for exercise with weapons; but Marcus Aurelius, the most careful liver of all the emperors, according to Galen, was a regular visitor of the *palaestra*, arriving in the short days at sunset, in the long days at the ninth or tenth hour. He loved, says his biographer, boxing, wrestling and running. Lucius Verus also enjoyed the *palaestra* and the exercises of youth. Narcissus the athlete, the companion of Commodus in his exercise and also his

murderer, was credited with omnipotence. Alexander Severus was also a 'wrestler of the first order'.

In civil rank athletes stood higher at Rome than any other public artists. Their Greek reputation still clung to them, and the imperial 'holy' contests gave them so much distinction, that such competitors enjoyed more honour than actors or gladiators, and, at least, were not, like them, infamous. The great jurists Masurius Sabinus (under Tiberius) and Cassius Longinus (consul in 30) decided that athletes did not follow an actor's trade, but rather demonstrated their bravery. In other sports, slaves frequently appeared: but, when the victor was wreathed by the hand of the emperor at the imperial *agones*, and at the sacred games of Greece, only free men might compete; for a law of Alexander Severus, that only free men might run in the Sacred Games, was probably a re-enactment of an older law. Also, in accordance with Greek custom athletes were treated with some consideration by corporations and governments. One of the distinctions the emperors might confer on pre-eminent athletes, was the life-long post of a *xystarchus*.¹

There were many guilds of itinerant athletes, who appeared in municipal *agones* and festivals; in the second century, one of the principal was the 'Guild of athletes of the wreathed victors at the Sacred Games', who honour Hercules. These Guilds, like all others, nominated their own officials, priests and presidents from amongst themselves. This guild had a home at Rome, and its principal officer was apparently sometimes given the direction of the imperial baths. Hadrian and Antoninus Pius allowed them to have places of assembly for councils, sacrifices, and archives, especially for the Capitoline Games. Antoninus gave them as a home the baths of Titus. Some Greek letters from the emperors to these athletic guilds are extant. In the *curia Athletarum* statues of great athletes were erected. Thus Valentinian, Valens and Gratian (367-375) put up a statue of Filumenus, who had been victorious 'from east to west' in every contest in the matches, half-boxing and half-wrestling. Not only every athlete rejoiced that 'he was worthy of eternal fame', but the Senate and people of Rome enthusiastically assented. In the same guild

¹ Superintendent of the *xystus*, or covered portico in which the athletes practised in winter.

these Emperors between 384 and 392 put up a statue of a certain Johannes : a proof that the Christians did not abominate this form of sport, as they did all the other spectacles. Further, famous athletes were naturally honoured by their native towns with statues. To one such champion, who had won at many contests, even in Asian and African cities, the Senate of Ostia voted, 'for the first time, at the request of the citizens, a statue to be erected at the public expense for his extraordinary skill and services to his native city'.

But, in the first century at least, despite these appreciations, athletes were generally spoken of disdainfully at Rome. Seneca is strong on this subject, calls them stupid, their life an oscillation between drinking and sweating, their bodies fattened, their minds rude and neglected, their art oil and diet. Pliny compares their gluttony with that of horses. A Christian writer says their first victory was the acquisition of a stomach of superhuman capacity ; they sell their wretched face to be cudgelled, to feed their wretched belly. But the Greek provinces thought quite otherwise. True, in cultured circles, athletes were held in mean esteem. Plutarch says that their teachers weaned them from books and accustomed them to pass their days in jokes and frivolity, to be, like the gymnasium columns, glittering and of stone ; and Epictetus even puts in one class gladiators and the 'dirty pancratist'. Galen utterly despised athletics ; he had been irritated by the insolence of boorish athletes, who actually raised their voice against doctors in an ill-sounding, barbarous dialect, and even wrote books on dietary, of which they did not know anything at all. He evidently used his opportunity of abuse to the utmost. He says the athlete lived like a pig or worse, continually compelled to eat, sleep and exert himself beyond measure, a cycle of gorging, drinking, sleeping, evacuation, and wallowing in dust and mud. Further, athletics destroyed manly beauty, and gave the body an appearance of unnatural strength, but, for all that, a strength unequal to many functions ; and the athlete was far more liable to disease, and, even if he were not maimed, was soon useless in his profession : he could not even acquire wealth. The gymnasium made men idle, sleepy and slow-witted, so corpulent as to be hard of breath ; swine would carry out important business better than athletes. And even in their own art, they could not

do anything notable. In a contemporary lampoon (see Galen, *Protrepticus*, 13) athletes are thus impugned : if Zeus should summon all the animals to the *agon* in the Stadium as well as men, a man would never win : a hare would win in the simple race, and in the double race a deer, in the long race a horse, in fights involving strength, elephants and lions, in boxing, bulls ; and asses in the *pancratation*, and the annals would record the victory of the Brayer over the men at the 21st Olympiad.

But such views were far from common in the Greek countries, for Galen had to advise young men earnestly not to prefer athletics as a career to the useful arts and sciences, nor to be led astray by the great hope of popularity. Since Greek life had lost its real content, it filled the gap with the shadow of past greatness. These *epigoni* clung with a natural and touching tenderness to the ancient recollections, and tried to preserve the ruined remains, remains often unrecognizable, of Hellenic culture and fame. Gymnastics was the first of such pious memories, an important means of education, actively practised in the institutes of the *ephebi*, and found in every Greek community from Berytus to Massilia.

The smaller the circle of higher and nobler interests, the greater became the significance of athletic contests. 'Good Greeks', Trajan writes to Pliny the Younger, 'cleave to the *gymnasia*'. In Greece one could practise 'the arts of play with honour' : to men of great culture, pre-eminent athletes seemed ideals of manhood, strength, beauty and modesty, comparable with the heroes of olden times. All Greece still assembled at the Pythian and Olympian Games, where the customs and procedure were still the same, and consecrated by centuries of use ; the Olympian victory was still the highest prize, worth arduous, long and expensive training, or even life itself. Descent from an Olympian victor was also an honour, especially for an athlete. Skilled competitors would be heavily bribed by their opponents to allow themselves to be defeated. Pausanias is surprised that not only Egyptians and foreigners could be thus tempted, but even Greeks, e.g., an Elean, who at the 192nd Olympiad (12 B.C.) bribed the opponent to secure victory for his son in the wrestling bout. The victors were hired by the providers of festivals at high fees ; Dio of Prusa mentions a payment of five talents (£1,178 14s.). The names of the *paradoxonicae* (those who in one day

won the wreath for wrestling and the pancratiū) were celebrated and revered throughout the world by their grandsons and great-grandsons ; such were Nicostratus at the 204th Olympiad (36 A.D.), who was the 7th or 8th after Hercules, Aelius Helix the Phœnician, the first *paradoxonicus* at the Capitoline Games.

Further, athletes, especially those who won the wreaths, enjoyed many privileges which Augustus confirmed and extended. Probably one of them was exemption from the costly municipal offices and charges, a privilege restricted by Diocletian and Maximian to men who all their life long had taken part in contests and had been victorious in at least three sacred contests, one at Rome or in Greece proper, without any suspicion of bribery. The sacred *agones* were those for which the emperors accorded the triumphal procession of the victors to their native city, and their life-long maintenance at the public cost. The towns in which famous competitors appeared vied in celebrating them in busts, statues, decrees of honour, gifts of the franchise and the dignity of councillor.

Sometimes the athletes showed their prowess in war. Mnesibulus of Elatea, victor at the 235th Olympiad (161 A.D.), fought at the head of some volunteers (probably about 178-9) and repelled the Costoboci, himself dying on the field. At the gallant defence of Byzantium against Septimius Severus in 194-196, a boxer played a prominent part. Hence it is hardly credible that, in the Greek provinces, it was considered improper for a man of good, even distinguished family to appear in public as an athlete, although only one inscription in confirmation of such an appearance is found : that of an athlete, Claudius Apollonius Rufus, of the fourth century, a man of consular family. Romans of good family probably only took part with their chariots in the chariot-races, e.g., at the 195th Olympiad (1 A.D.), when Tiberius entered a four-in-hand, at the 199th (17 A.D.), when Germanicus took part ; at the 227th (129 A.D.), Julius Minicius Natalis, son of the consul of 106 or 107, and himself afterwards consul. Similarly the Roman senator won, who had his statue erected there in the time of Pausanias, if he was Roman.

Generally, the social position of an athlete in the Early Empire was far better in the Greek provinces than at Rome or in Italy. But, as Greek and Oriental civilization generally

broke up and finally dissolved Roman national feeling, in the same proportion Roman prejudice must have abated. When the floor of a brilliant room in Caracalla's *thermae* was decorated with long rows of pictures of athletic victors, when Cassius Dio mentions the double victory of Aelius Helix at the Capitoline *agon* in his annals, the heroes of the stadium stood in higher esteem in the capital and in the West, than when Seneca, the two Plinies, Tacitus and Juvenal so unanimously decried the worthlessness and depravity of Greek exercises and contests.

CHAPTER II

ROMAN LUXURY

GENERAL REVIEW OF THE SUBJECT

IN 1605 Meursius wrote a monograph, '*Roma luxurians sive de luxu Romanorum*', which, as a general impression of a number of motley and heterogeneous facts, of which the best known are the most strange and monstrous, conveyed the idea prevalent to the present day, that the luxury of the later Roman Empire was fabulous, unparalleled, immoral and senseless. This treatise is the main authority for this view. The memory of imperial Rome calls up those oft-repeated tales of palaces built into the sea, of high roof gardens, of gold and silver mules' shoes and receptacles for filth and rubbish, of baths in asses' milk and fragrances, of drinks in which costly pearls were dissolved, and dishes of peacocks' brains and flamingoes' tongues.

These exaggerations flourish in an atmosphere which magnifies everything Roman, good or bad, to a Titanic extent, as compared with modernity; a tendency to which even the best antiquarians are too prone, e.g., C. G. Zumpt, who thought we were babies, as compared with the ancients, in the art of enjoyment, and W. A. Becker, who deemed our most extravagant luxury poverty in comparison with the prodigal magnificence of Ancient Rome. But a closer examination shows that the authoritative facts have been distorted or misconstrued, and that this view must be taken with several grains of salt. This would be so, even if the facts were as fully credible, as their nature partially proves them not to be.

Further, since the first decades of the nineteenth century, and still more since about 1850, throughout civilization

luxury has increased enormously, and the standard for us is not that of those who, one or two generations back, thus expatiated on Roman luxury. Compare the first and the second French Empire; the luxury of the first astounded the world; it seemed modest to the second. Alfred Austin in 1883 said that, in the last generation, English luxury had advanced with prosperity, step by step; and Gladstone says that luxury has become far greater in the last fifty years than in all preceding centuries since 1066, and that the life of the rich is unlike anything known since the decline of Rome.

This traditional risk of antiquarianism, of drawing false conclusions from isolated cases, and mistaking the exception for the rule, has not been avoided by critics of Roman luxury. But, further, after the fashion of Meursius, statements from any epoch and of any sort have been jumbled together—tales of the extravagances of notorious spendthrifts, and refined debaucheries of voluptuaries—without, as a rule, any consideration of the point of view of the author, or the context.

But, above all, the tales of luxury of individual emperors should have been excluded. A Caligula or a Nero became abnormal in this respect, because they had a mania to inspire the world with the idea of their omnipotence, to prove the superhuman greatness of Caesardom, and the immeasurable gulf between the world-ruler and his subjects; a demonstration that for him nothing was impossible, that his will was limitless. Thus Caligula, whose Caesarian madness seems to have been tainted with actual insanity, who 'strove most of all to realize what men deemed impossible', had buildings set up in the sea during a storm, and squandered the tribute of three provinces (10 million sesterces, about £100,000) in one day; thus he and Nero, the 'desirer of the incredible', undertook to realize the wildest dreams of fantasy at their feasts, in their ships of state and palaces.

But in the first two centuries Caligula and Nero are isolated exceptions. Not even Lucius Verus is comparable; Vitellius' luxury was the sating of a monstrous gluttony. On the other hand, Tiberius, Galba, Vespasian and Pertinax were economical and even mean; the rest were never spendthrifts. And it is doubtful whether even the luxury of Caligula and Nero was more extravagant and per-

icious than that of many a petty German prince of the seventeenth and eighteenth centuries. Augustus the Strong of Saxony spent 80,000 thalers on one opera, and five millions on his pleasure camp at Mühlberg. Charles of Würtemberg, the founder of the Karlsschule, made his court the most brilliant in Europe, had the best actors playing at his theatre, gave the most costly gifts by lot to his guests, had fountains of wine for the multitude, fireworks that cost half a ton of gold, dug lakes out of mountains, gave sledging parties on snow transported from miles around : and all the money for this wild extravagance was extorted from countries whose taxable wealth was hardly equal to that of a single Roman province. Under Augustus the Strong the revenue of Saxony was six million thalers. Würtemberg, a country of 155 square miles and about 600,000 inhabitants, found the revenue from the royal demesnes and the taxes insufficient to cover expenses. It would be as just to deduce the manners of Germany of that time from the habits of these absolutist Courts, as to infer from the luxury of Caligula and Nero the manners of Rome. It is equally misleading to refer to the Roman grandes of the late Republic, who in their victorious campaigns plundered wealthy and partially unexhausted lands, and returned home with vast wealth and treasure. The colossal expenditure of a Scaurus, Lucullus, Pompey, and Caesar was induced by conditions that never recurred in antiquity, and on a scale hardly surpassed by the emperors. Plutarch says that the gardens of Lucullus, despite the great increase of luxury, were still among the most splendid of the imperial gardens ; and, according to Pliny, Scaurus' theatre, the work of a private individual, was more wildly extravagant than any building of Caligula or Nero. We cannot tell whether the spoils of the centuries-old treasure-hoards of the Oriental despots, which fell into the hands of the Roman conquerors of Asia, were less than the booty of the Spanish *conquistadores* or the English conquerors of India. The ransom for Atahualpa, the Inca of Peru, was 23,300,998 francs (the franc then being worth at least four times its present value), of which Pizarro's share was 1,402,748 francs. Clive, says Macaulay, could easily have piled up a fortune in Bengal, greater than any other subject in Europe possessed. Without extorting more from the rich natives than was usual

under the mildest native ruler, he could have made sure of presents amounting annually to £300,000, since the neighbouring princes would willingly have bought his friendship at any price. Roman generals and provincial officials had the same opportunities in the East as Clive and Warren Hastings, and were as grasping as the latter. A few facts may illustrate the enormous sums they amassed. Aristobulus, the King of the Jews, at the time of his quarrel with the high priest, his brother Hyrcanus, bribed Aulus Gabinius the Legate with 300 talents, Marcus Aemilius Scaurus the quaestor with 400, and Pompey with a golden vine worth 500 (a talent = £235 15s.). Ptolemy Mennaeus, prince of a predatory state on the Lebanon, bought his freedom and independence from Pompey for 1,000 talents, with which Pompey paid his troops. Ariobarzanes of Cappadocia paid him 33 talents a month, which hardly amounted to the interest on his debt. Gabinius brought home from his proconsulate in Syria over a hundred million *denarii* (£3,500,000). He received 10,000 talents (£2,350,000) from Ptolemy Auletes of Egypt in return for his support, after Caesar in his own and in Pompey's name had mulcted him of 6,000 talents (£1,400,000). Crassus robbed the Temple at Jerusalem of money and valuables to the amount of 10,000 talents. Gaul, too, was a proverbial land of wealth, and rich in gold in Caesar's time. In 106 B.C. Quintus Servilius Caepio sacked the temple at Tolosa, a city of the Tectosages, and, according to Posidonius, secured over 15,000 talents (£3,500,000). In the whole region of the Rhine, and by the Loire and Seine all coins were of gold in many places, and Caesar's Gallic booty included so much gold that the value of the pound fell from 4,000 to 3,000 sesterces in Italy and the provinces, a depreciation of 25 per cent. as against silver.

But the necessary expenses of position and notorious crimes obliged the Romans of the late Republic to spend as large sums as they looted. Like Warren Hastings, their acquittals might mean a total or partial sacrifice of their filchings. And the huge expense incidental to political undertakings, bribery on an enormous scale, the maintenance of a numerous train of servants, the fabulously splendid spectacles, swallowed up tremendous sums. The aedileship of Scaurus exhausted his property and involved him in debt. Thus these

treasures were lost as soon as they were won: these nabobs owned very little in comparison with their receipts and their outlay. Crassus even, whose wealth was unexampled in his time, was not so rich as many freedmen of the Early Empire, such as Pallas, Callistus and Narcissus. Before the Parthian War he owned about 7,000 talents (£1,650,000). To the Elder Pliny, the later Republic seemed, in comparison with his own time, an epoch of penury. Probably, as a matter of fact, capital was accumulated in greater amount, and more generally, in imperial times than under the Republic. The causes of an increase of general prosperity also contributed to the making of large individual fortunes, especially the plunder of many new unexploited provinces, the increase of trade, especially with less civilized peoples, the assurance and facility of means of communication, and the quicker circulation of money.

But, although the greatest wealth of the Empire included slaves, a valuable property now practically extinct, it was still much less than the opulence of modern days. A freedman of Nero might call a man worth £652,500 deplorably poor, but millionaires in all ages are insolent; even if the tale be true, it is a proof, not that such a fortune was poverty, but that it was poverty compared with their own. Similarly, of one capitalist who only left £2,000,000, the greatest banker of Europe is said to have remarked, 'I did not think he was so poor'. The greatest fortunes throughout the history of Rome were only 300 and 400 million sesterces (£3,762,500 and £4,350,000), but only two persons are recorded worth so much, the augur Gnaeus Lentulus, and Nero's freedman, Narcissus; but capital then bore higher interest than now, at least 6 per cent. The largest income known in antiquity was that of the richest families at the beginning of the fifth century, about 4,000 pounds of gold net, and a third as much in kind: according to present standards about £243,624 a year.

A useful, if insufficient, estimate of these sums can be derived from a few facts as to the greatest properties and incomes at different epochs and in various lands: many of these fortunes are larger than those under the Empire. Huge fortunes were easily acquired and squandered under the Khalifs. Under Khalif Mahdy a rich Hashimid at Bassora had a daily income of 100,000 dirhems (or francs), and 50,000

clients. Lorenzo de' Medici left at his death in 1492, 235,137 gold florins.¹ Jacques Cœur (1400-1456) was the richest man in France in the Middle Ages, with all the banking business for imports and exports in his hands, and owned many branches in the Levant, and in most of the French towns, as well as copper, lead and silver mines; he was able to lend Charles VII 200,000 écus (16 or 20 million francs), to drive the English out of Normandy. He acquired more than twenty domains and castellanies, had houses and castles in the great cities of France and fitted several of the castles up. An unjust fine against him amounted to 400,000 écus. Agostino Chigi, the banker of Julius II, a Rothschild of his time, owned more than 100 ships at sea, and commercial houses at Lyons, London, Constantinople, Amsterdam, and even Babylon, had 20,000 men in his employ, and an income of over 70,000 ducats. The Fuggers, according to R. Ehrenberg, in 1511 possessed 250,000 florins in round figures, and by 1527, 2,000,000, and in 1546 their fortune amounted to 4½ millions; at the beginning of the seventeenth century, after a loss of 8,000,000, they became bankrupt. Voltaire estimated Mazarin's fortune at 200,000,000 francs. Under Louis XIV Samuel Bernard the banker was worth 33,000,000 livres, and Bretonvilliers, a former tax-collector, had an annual income of 3,000,000 francs (modern value). Alekséy Danilóvich Menshikóv (who died in 1729) at his banishment had either 5 or 10 million roubles. In Little-Russia he owned four cities, 88 ecclesiastical villages, 99 villages, 15 hamlets, and 87 fisheries; in Ingermanland 16 estates, 98 villages, diamonds and precious stuffs worth a million roubles, 72 dozen silver plates, 105 *puds* (1686 kilogrammes) of gold table plate. Potemkin, despite a frightful extravagance and luxurious life, scarcely rivalled in the *Arabian Nights*, amassed a fortune of 90,000,000 roubles in sixteen years, though the State revenue was only 50 millions. Kutaisov, the favourite of Paul, had an income of 300,000 roubles. The annual expenditure of Count Brühl was estimated at 6,000,000 marks. Cardinal Louis Rohan, notorious for the necklace case, had an income of about £250,000. Of the Spanish grandees in the eighteenth century the Duke of Alba had a revenue of 8,000,000 *reales* (more than

¹ The intrinsic value of the Ducato, Zecchino, Fiorino d'Oro, Scudo d'Oro is about the same, 11-12 modern francs.

£80,000), and the Duke of Berwick 2,000,000, but these incomes were chiefly squandered on a large train of servants. According to Bismarck in 1859 the Duke of Ossuna had an income of millions, owned splendid gardens and castles in Spain, Italy, Belgium and Sardinia, of which he had only seen pictures. Of the Polish magnates under Stanislaus Augustus, Felix Potocki could ride thirty miles on his own land, and, in despite of his father's debts, he still had an annual income of 700,000 marks, and was the richest man in Poland. The Czartoryskis owned fifteen cities, eleven domains with castles, two palaces in Warsaw, and the estate of Augustus Czartoryski brought in a revenue of £90,000. Karl Radziwill left, after a thoroughly Polish mal-administration, an estate worth £125,000 to £150,000 annually.

Up to 1863 the serfs, who comprised nearly a third of the population, formed a large part of these fortunes. Catherine II is said to have given away 800,000 of them, and Count Peter Borisovich Sheremetyev, the son of Boris Petrovich, ennobled by Peter the Great, was the largest owner of over 160,000 or 200,000 or 128,000 male serfs, some of whom were themselves millionaires. Prince Nicholas Borisovich Yusupov, when Frederick William III visited him at Moscow after the birth of Alexander II in 1818 at his estate at Archangel, gave a feast and had forty thousand serfs in festive dress to receive the guests and offer them salt and bread, the Russian symbols of hospitality. The Yusupovs, though their estates were often confiscated for conspiracies, in 1870 were wealthier than most German princes, and, as two serfs, father and son, as stewards had earned them 3 millions, were hardly affected. The Demidovs, it is said, owned a huge rock of malachite of which every *pud* was worth 800 roubles. Astashev, a very wealthy man, in a single year (1843) obtained 111 *puds* of gold, i.e., about £255,244 10s., from his mines in Siberia; Yakubov the ensign, 'perhaps the wealthiest man on the Continent in 1847' was worth more than £15,000,000.

In the rest of Europe and England in particular, as also in America, the accumulation of capital in a few hands since about 1850 had attained unprecedented heights. In 1818 Mme. de Remusat could still call a fortune of a million 'immense'. In England, in Johnson's time, no man of eminence could spend more than £5,000 a year; according to Macaulay, about

1760 an income of £40,000 was as rare as one of £100,000 in 1840; in 1854 there were only twenty members of the House of Commons with an income of £10,000, but in 1888 five times as many with an income treble or quadruple. Warren's *Ten Thousand a Year* was written in 1841. In New York in 1846 there were only sixteen persons with property over a million dollars; one of these 'modest millionaires' was John Jacob Astor, who died in 1848 worth 25-30 million dollars. These immense fortunes of individuals began with the great revival of America after her Civil War. In 1865 Alexander T. Stewart gave his annual income as 4,071,256 dollars, and paid 407,000 income-tax. Cornelius Vanderbilt in 1846 was worth 750,000 dollars, and died at the age of 81 in 1877; he said he had on the average made a million every year since his birth: he left his heirs 90 millions, and legacies amounting to 15 millions. Jay Gould in 1884 was deemed the richest man in the world, and had 275 millions. J. W. Mackay came second with 250 million dollars.

But if America has the largest number of individual incomes, England is the richest country: in 1888 it had 200 of the total 700 owning over £1,000,000; 2,418 had an income of over £10,000, and in France only 700-800, and in Germany only 144. A list was drawn up in 1884 of the twelve greatest millionaires. Rothschild, the richest man in England had £40,000,000, and the Duke of Westminster £16,000,000; the three other Englishmen are the Dukes of Sutherland and Northumberland, and the Marquis of Bute, who comes last with £4,000,000. The seven others are Americans. In Prussia, at the beginning of 1900, the income-tax registered forty-two persons with £50,000 to £100,000 annual income, fifteen with £100,000 to £350,000, and Krupp with £750,000 to £800,000.

But all these facts cannot settle the question whether the opulent of antiquity were richer than the opulent of to-day, even if the real worth of money in both periods were accurately known. It has been held that the purchasing value of money was then far higher than now, a view confirmed by the latest research on the subject by Robertus. He admits it sank from the last centuries of the Republic up to about Nero's reign, but only in Rome and Italy; and after Nero it rose throughout the entire Empire. But, apart from the many

side issues, the facts of antiquity by no means suffice for such sweeping conclusions. For, in ancient times, the means of enjoyment and the industrial products were enhanced in price by the difficulty of transport and the imperfect methods of manufacture, as also by their comparative rarity, the smaller amount of the noble metals in circulation in the Empire, and a proportionate absence of the means of enjoyment and of objects of value. The use of paper for money only developed slowly, and the rapidity of the circulation of money, which is equivalent to a greater abundance of it, cannot be estimated. It may never be ascertained (though it is not impossible), whether the mass of manufactured or imported commodities has not increased in the same measure as the quantity of gold and silver, or whether—and this is the principal means of comparison of wealth then and now—the greatest fortunes under the Empire were more in excess of ordinary incomes than they are now. Anyhow, any calculations of the relative purchasing value of the same sums in antiquity and the present time are absolutely arbitrary.

The luxury of emperors, and the great men of the dying Republic is abnormal, as also the other examples relied on, some of which are reported as quite exceptional. Apicius under Augustus and Tiberius squandered huge fortunes of 60 or 100 million sesterces in refined debaucheries, and, on credible authority, committed suicide on finding it reduced to ten millions, because he could not live on such a pittance, or possibly because he had exhausted every kind of pleasure ; he was regarded as a marvel of extravagance by his contemporaries. Apio wrote a learned book on his luxury : his name became proverbial, a myth and a perfect type of the reveller ; two hundred years later Elagabalus took him as a model. He was the subject of many anecdotes, of which the following, possibly borrowed from his book, will suffice. He once took a dangerous voyage to Africa from Minturnae, because he had heard the crabs were bigger there, and returned at once, when convinced of the contrary. As a rule, to infer universally from anomalies and exceptions is unsafe, and especially for imperial Rome, where influences and conditions, never since reproduced, tended to exaggerate vice and extravagances to the utmost : and thus Apicius and his compeers may have outdone a Count Brühl or a Cardinal Rohan, who is said to have failed

to understand how any one could live on less than 1,500,000 *livres* income.

But the senseless luxury which delights, not in enjoyment, but in the destruction and degradation of the valuable, is naturally rare, and apparently no commoner in Rome than in modern capitals, where at all epochs great wealth and licence of pleasure has produced satiety and arrogant vandalism. Examples can be found in other histories. The mediæval nobles sought fame in complete disregard of their property, which they thoughtlessly squandered and destroyed. In 1174 Henry II of England summoned to Beaucaire an assembly of squires and knights, and Bertram Rambaut had a piece of land ploughed and sown with 30,000 *sols* in pennies. Guillaume de Martel, who had a retinue of three hundred knights, had all the provisions in his kitchen cooked on wax torches, and Raimond de Venous had thirty horses burnt alive. In 1500 Joachim I of Brandenburg came to Frankfort to receive the allegiance of the city, and Herr von Belkow walked beside his horse in the mud in velvet boots set with pearls. He also used to ride into the pottery market with his brothers, let their horses smash all the articles, and then paid double the price: they then led their horses back into the *Rathskeller* and washed them in malmsey wine. In Russia certain very festive occasions are considered incomplete, if the plate is not broken; German sailors make a point of dancing on porcelain, when on shore; Creole women in Habana 'spread their new Paris-made dresses over the wheels of their carriages, to destroy them in an instant and so make a boast of their wealth'; these facts show that this perversity is not limited to any one epoch, but is implanted in the human soul.

The only striking instances of this form of luxury in ancient Rome are, apart from imperial extravagances, the use of singing birds and birds taught to speak as food, and sipping dissolved pearls. According to Valerius Maximus, the son of Aesop the great tragedian, who made a large fortune, had a mania for the latter, and, according to Pliny, used to set before every one of his guests a dissolved pearl. According to Horace, he once swallowed the pearl Metella had worn as an ear-ring, in order to drink down a million at a gulp. Maximus ascribes to the father, and Pliny to the son, the roasting of singing and speaking birds: Pliny estimates the cost of each dish at 6,000

sesterces, and the course at 100,000 ; and Horace mentions the two sons of Quintus Arrius, who used to feed on expensive nightingales. The variations in the accounts of these and similar anecdotes show that the details are untrustworthy, and that their only value consists in the general credence they obtained. The frequent repetition of such stories (including that of Cleopatra's pearl) has led to the conclusion that such incidents were common. But in reality these 'solecisms of luxury' were considered abnormal even then. Augustus, it is said, had his Egyptian procurator Eros crucified on a ship's mast, for buying and roasting a quail which had won its every fight. Such extravagances as breaking a silver vessel of Mentor, an old Cellini, in order to have the reliefs attached to a mistress' toilette-table, characterize the senseless wastrel or the uncultured *nouveau riche*. Trimalchio's cushions are stuffed with purple wool ; and a slave is whipped for binding his master's wounded arm up with white, instead of purple wool. These incidents no more illustrate contemporary luxury, than the luxury of the eighteenth century is indicated by a Prince di Conti, who bestrews the ink of a letter with diamond dust, or the daughters of Tepper, a Warsaw banker, who in 1790 had their coffee made on a sandal-wood fire.

A further source of error is the habit of assenting unreservedly to the condemnation by Roman writers of certain forms of luxury, whereas an unprejudiced examination would have shown them innocent and sensible, even welcome symptoms of advance in civilization and prosperity. For the idea of luxury is relative. 'Every individual rank and age declares every commodity a luxury which it does not consider indispensable'. But on the whole the views of antiquity in this respect were more austere than those of modern times. The life of the ancients, as to some extent that of the Southerner even now, was far more in accordance with Nature than ours. Hence, every artificial satisfaction of needs, created by greater civilization, appeared to them not only superfluous, but unnatural, whereas the highly civilized Northern nations, who have in the first place to compensate industrially the meagreness of Nature, regard—and often rightly—every advance in craft as not only harmless, but a sign of progress. And besides, our three main authorities on Roman luxury happen to be Marcus Varro, Lucius Seneca and Pliny the Elder, men

of peculiarly simple and strict habits, who acted on a principle of abstemiousness beyond the average of their contemporaries. This is especially true of Seneca, who in his youth abstained for a whole year from flesh, and, on the advice of Attalus, denied himself every forbidden and superfluous pleasure; he gradually became less severe; but, even in his old age, would not avail himself of oysters, mushrooms, scents, wine and warm baths, and practised great moderation in the few pleasures he permitted himself. The effects of his abstemiousness were shown by the condition of his body at the time of his death. He, Pliny and Varro, with very little qualification condemn every comfort, every refined and superfluous enjoyment; Seneca and Pliny are inclined to advocate a return to Nature. Pliny, contemplating the inexhaustible wealth of creation if left to herself, was confirmed in this tendency, and even stigmatizes the sailing-ship as an unwarrantable infraction of the order of Nature. Varro disapproves the importation of foreign foods. Pliny thinks the artificial growth of asparagus a monstrous piece of gluttony; he and Seneca—Seneca repeatedly—declaim against the cooling of drinks with snow, as an unnatural luxury: snow is now, and has been for centuries, indispensable to the poorest Southerner; Addison, who visited Naples in the beginning of the eighteenth century, thought a famine of snow, like a famine of corn elsewhere, would cause a revolt. And the desire is very natural; Galen recommends Rome, as snow is so easily procurable there. In Sicily, the growing use of snow is said to have raised the general standard of health.

Iced fruits and other flavoured substances were invented by the French at the end of the seventeenth century. The great spread of the manufacture and trade in ice in modern times is a good illustration of the difference between modern luxury and ancient, with its narrow limits. The American ice-trade, which about thirty years ago reached its height, and annually exported over £500,000 worth of Arctic ice to the equator, has now almost everywhere given way before manufactured ice, and probably refrigerators will soon be an indispensable household article.

Pliny was on insecure ground in declaiming against the use of snow as a refrigerator, but on surer, when protesting against feather-cushions, which, although mentioned by Cicero, can

never have been general, as they scarcely suit a Southern climate. But even this is hardly an excess of luxury. A political economist of the eighteenth century thought it evidence of the meagreness of Roman commerce that the Romans, to fill their cushions and pillows, only used the feathers of German geese and swans, whilst eiderdowns from the Polar countries were unobtainable. Pliny gives the price of goose-feathers as five *denarii* to the Roman pound (4s. 4d. for three-quarters of a pound). A pound of the finest eiderdown cost 6 thalers at Frankfort in 1786.

A further consideration is the tendency of most Roman writers of the period to extol the past at the cost of the present. Throughout the whole of later Roman literature there is a monotone of complaint at the degeneration of the age, and the regret at the prevalence of luxury, often justified, is far too much of an exaggerated commonplace. These *capucina*-*ades*, as Goethe called them, are, perhaps, one of the rhetorical commonplaces of the Schools, which infected even men like Seneca, who believed that human affairs always remained at the same level. Pliny, to judge imperial luxury, assumes as his standard the time when meal was eaten out of earthenware pots, and was the principal food, when the walls of houses were not even rough-cast, and one slave was sufficient for a large household. He and others talk as though this simplicity could have survived after Rome had become the capital of the world, with every commodity from every zone pouring in, and after a highly developed civilization had multiplied needs and pleasures, made them more refined and more widely spread. To such writers glory and splendour, grace and comfort, seemed as undesirable as the seamy side of civilization. Their grievance is as ill-founded as that of a modern who would set back the hands of the clock to a time of unpaved, unlit streets, when windows had no panes, and forks were unknown. Forks came into use in France in the fourteenth, and in Italy at the beginning of the fifteenth century, and were at first discountenanced; Dandolo, an old chronicler, tells of the wife of a *doge* who used a golden fork, and reeked like a corpse before her death as a punishment. Thus too the annals of the fourteenth and fifteenth centuries regard every device for the increase of comfort or pleasure as a symptom of decadence, e.g., when bags of straw were replaced by mattresses, torches

by tallow and wax-candles, and bed canopies and curtains came into use. So too Holinshed prefaces his Chronicle of 1577 with a complaint at the introduction of stoves in England, and of pewter dishes and plates instead of earthen and wooden ones.

Finally, criticism of luxury has been rendered more difficult owing to its varieties not being distinguished, and excess in one being ascribed to all. But the same people at the same time may be very extravagant in one direction and very economical in another. Thus, according to William of Malmesbury, the banquets of the Anglo-Saxons were very lavish, but their homes mean, whereas the Normans were moderate eaters and built themselves splendid castles. In Germany from the sixteenth century up to recent times the homes were meagrely fitted up, but luxury was shown in dress, as so many sumptuary laws on dress prove. In the seventeenth century Russian luxury was exhibited in the extravagant use of jewellery, and otherwise almost exclusively in richness of attire, mostly of Oriental stuffs and silk. The Patriarch Nikon in 1652 in seven months spent 700 roubles or 150,000 pounds of rye on his dress, and lived otherwise on a peasant's fare, and very cheaply. Even at Court, there were golden dishes but no plates or napkins. In the seventeenth century Spanish grandees similarly combined finery and cheese-paring. Their luxury consisted in an enormous expenditure of the huge supplies of gold and silver from Mexico and Peru, mainly on plate; in accumulating costly furniture and decorations, and in numerous retinues of ill-paid, starving attendants; their living-rooms were vast, their sedan-chairs magnificent, their mules gorgeously draped, hooped with silver; they had coaches and horses at enormous prices (e.g., 12,000-25,000 escudos); women's dresses were overloaded with jewellery and pearls. But fine linen was so rare, that many had only a single skirt, and had to do without or stay in bed whilst it was being washed. In fact all this tinsel concealed great poverty; ready money was scarce, and was hoarded up, instead of being put out at interest. President de Brosses (1739-40) observes that French and Italian ideas of splendour were very different. 'We in France reckon a great house or a great man by the excellence of his table.' The rich kept a large kitchen-staff, livery servants, had three times as many courses as they needed,

had the dessert very elaborately served: the Italians used their wealth to bedeck their native city with monuments or fine buildings, so to immortalize their name and artistic taste. De Brosses also says that the Venetian patrician ladies glittered at feasts with their jewellery, but lived very sparingly, in the simplest rooms of those proud palaces, any one of which in less than seven hours could offer the imposing spectacle of forty splendidly furnished rooms.

Thus varieties of luxury are nowise necessarily connected, and the luxury of the table, dress, decoration of the home and domestic arrangements, of burial, slaves, and art in the Roman Empire depended partially on very diverse conditions, and require treating separately. In the same way public and private luxury must be severally considered. At this point we deal circumstantially only with the latter.

The first period of vast luxury at Rome was the reign of the nabobs, and Lucullus, enriched with the booty of two Oriental kingdoms, could live like a 'Xerxes in a toga', and was, then and after, regarded as the type, which introduced into Rome the fashion of extravagance in buildings and banquets. But such expenditure was isolated under the Republic, or at least confined to a limited circle, and became general only under the Monarchy, when, as has been said, wealth became greater. Hence Tacitus is undoubtedly right in saying that Rome's period of greatest luxury was from the Battle of Actium up to the accession of Vespasian, who, himself old-fashioned, did more by his example to restrict extravagance than any laws or decrees. And, besides, many great families, under the Julian Emperors, had been ruined in the attempt to distinguish themselves by their magnificence, and the survivors profited by their example. And, lastly, the Italian cities and the provinces had introduced many *novi homines* into the Roman aristocracy, who preserved their native economy amidst their new surroundings. For the whole of the second century these facts tended to diminish luxury, as also the good example set by the emperors (with the exception of Lucius Verus), and the steady decline of the old and rise of the new nobility. Hence it need not be assumed, that, after Trajan, in whose latter years Tacitus made his statement (above quoted), there had been any material change in this respect.

I. THE LUXURY OF THE TABLE AND THE IMPORTATION OF FOREIGN FOODS

§ 1

The censure of the ancients on the luxury of the table must be very cautiously taken. Southerners need much less nourishment, are far more moderate eaters and drinkers, and would regard a seasonable diet of ours as excess. The attitude towards the use of unmixed wine is one instance. Even the philosophy of Epicurus inculcated the greatest simplicity of pleasures, and the highest moderation as its first precept. The 'Teacher of Luxury' exalted him as Jupiter who was satisfied with bread and water: on this rule he insisted, and, as a supreme indulgence, allowed himself only Cythnian cheese; like Pascal at Port-Royal he tried to restrict himself to the minimum of food necessary to sustain life, and was proud that it cost him less than an *as* ($\frac{2}{3}d$); Metrodorus could not reduce his fare as much and spent a whole *as*.

At Rome, for a long time the greatest simplicity prevailed at table. In 188 B.C. the army returned from Asia Minor, acquainted for the first time with Oriental luxury and debauchery, and with the knowledge that there was any *art* of cooking; from that time cooks, hitherto the least accounted of slaves, began to fetch good prices; but even then and for the next hundred years, the luxury of the table cannot have been very great. For up to 174 B.C. the *matronae* baked their own bread; and in 161 B.C. the fattening of hens aroused great indignation, and was forbidden by a censorial edict, which was re-enacted in all subsequent sumptuary laws: but the provision was evaded by fattening cocks. Much later still, foreign birds and shell-fish were imported into Rome; these, and dormice, were forbidden by an ordinance of 115 B.C., or perhaps not till 78 B.C. About 100, Greek wine was still never served more than once, even at splendid banquets, and, in view of the facilities of communication between Greece and Italy, this fact testifies to the modesty of the table at that time. Posidonius the Stoic, in one of his notes written about 100 B.C., observes that the wealthy in Italy accustomed their children to quite simple fare, and made them eat anything there was at hand, and

'drink mostly water: 'the father or the mother would often ask the son if he would like some fruit for dinner; and, after he had eaten some, he was satisfied and went to sleep'.

Yet 'flourishing trade made foreign foods and other articles necessities'. Rome's oversea relations became closer and wider; commerce more lively, and the shores of the Mediterranean exchanged their products: very soon the Romans learned that the best kids were to be had in Ambracia, the best donkey fish at Pessinus, oysters at Tarentum, and dates in Egypt. The severer moralists like Varro disapproved this tendency, and like Luther and Hutten in sixteenth century Germany considered as very reprehensible the neglect of excellent home products in the search for luxury. But this stern attitude was never common even in antiquity. Thucydides exalts Athens as receiving the imports of all countries and enjoying foreign commodities as its own; and the later Attic comedians, like Antiphanes, and Archestratus of Gela (who supplied material to Ennius) made a gastronomic tour of the world, and drew up lists of cosmopolitan delicacies with the same complacency as Brillat-Savarin, who celebrates the international origins of the meals of Paris, to which every quarter of the globe contributes its share.

Varro would be still more out of court to-day when 'a middle-class German family breakfasts on coffee from the East Indies, Chinese tea, sugar from the West Indies, English cheese, Spanish wine, and caviar from Russia, without being accused of luxury'. 'I assured him', says Gulliver, 'that this whole globe of earth must be at least three times gone round before one of our better female Yahoos could get her breakfast or a cup to put it in'. In our time, every day we derive our food from the whole world and see nothing to blame, much less any sign of luxury in it; and Varro's complaints would be all the more out of place as transport to Germany from Asia, America and Africa is certainly no easier or less costly, than from the near Mediterranean coasts to Rome, which was practically a harbour. And the preference for certain commodities of certain places is always a necessary consequence of the increase of prosperity and commerce. The Paris, for example, of the thirteenth century was in many respects the first city of Europe, yet trade and wealth were scarcely as great as in Varro's Rome; yet 'with

regard to the source of certain foods anything but indifference prevailed ; every one knew what district produced this or that article best, and whence the *gourmet* might fill his larder. Thus Vermandois peas, Orleans cresses, Auvergne turnips, Corbeilles onions, Étampes shalots, Champagne and Brie cheese, Bondy fish, Burgundian pears and Auvergne apples were greatly esteemed. The best chestnuts came from Lombardy, figs from Malta and raisins from the Levant : of foreign wines, Moselle wines, Spanish, Cypriote, Greek and Italian were specially in demand. Similar facts may be collected from all times and countries, whose commercial development is sufficiently known. Nicolai, in his life of Sebalduß Nothanker, makes a German count and epicure catalogue all the best foods of the German provinces alone, since his patriotism could not endure French food. Every day by post he received large marenas (a kind of salmon) from Pomerania, three-quarters of a yard long, flounders from the Isle of Hela, and Berlin *sandar* (perch-pike); cold tarts from Hanau, spiced brawn from Frankfort, are to be sent him in March ; so too fieldfare from the Harz, pheasants from Bohemia in February ; crabs from Sonnenburg, Westphalian hams cooked in champagne, caviar from Königsberg, Astrachan melons and pineapples. And Germany was then a poor and commercially undeveloped country.

A perusal of what Roman writers say about ' the disgusting hunts ' and the explorations of land and sea for delicacies would make one think huge preparations were made, and whole armies of men sent out on long, dangerous and difficult expeditions, to fill the plates of Roman epicures. With Vitellius it certainly was so ; for he had the ingredients of his famous gigantic dish fetched by the Roman fleets even from Spain and Parthia ; they were flamingo tongues, mackerel livers, pheasant and peacock brains, and lamprey-milk. But, even among the emperors, Vitellius only found one imitator, Elagabalus ; there were many more *gourmets* among the French of the eighteenth century. Verdelet, for instance, had one dish made out of the tongues of two or three thousand carp, which cost 1,200 *livres*, and Prince de Soubise often dined on an *omelette royale* invented by the cook Martin for Louis XV, and made out of cockscombs and carp-milk, which cost

100 *écus*. But, apart from the monstrosities of the imperial orgies of ancient Rome, a simple explanation is, that among the products of all countries their foods and dainties also came into the market and found a good sale. And of these delicacies from distant countries, which excited such indignation, most are birds, pheasants and the Numidian guinea hen, flamingoes and some others ; part of them were already being bred in Italy and cannot have been expensive ; in the tariff of maximum prices ordained by Diocletian, the pheasant is only priced a quarter as much again as a goose. Both birds were roasted for feasts : at the very frugal table of the Emperor Alexander Severus two fowls, one hare and much game were served up daily, and a goose on ordinary festival-days, and a pheasant only on extraordinary occasions : the Emperor Tacitus was also fond of pheasants.

Further, only after the establishment of the monarchy did the acclimatization of foreign animals and vegetables (which will be dealt with later), and their acquisition through commerce, spread to any extent, and Varro's angry censures are directed against the beginnings only of such luxury. For, in his time, foreign dishes were rare even at luxurious meals. A list of dishes eaten at a priestly inauguration between 73-63 B.C. has been preserved ; there are a few foreign dishes, but none rare or costly. It took place on August 24. The first course consisted of sea-urchins, plain oysters *ad libitum*, two sorts of mussels, a thrush on asparagus, a fatted hen, a *ragout* of oysters and mussels, black and white chestnuts ; then different kinds of shell-fish and marine animals with becaficos, loins of does and wild boars, game-pie, and purple fish with becaficos. The chief course consisted of udders of sows, a pig's head, fricassee of fish and sow's-udder, two kinds of duck (boiled or otherwise prepared), hares, roasted game, a meal pudding and Picentine bread. The menu of the dessert is lost. At this meal the most distinguished men and women of Rome sat down, including Julius Caesar as Pontifex, and six priests and six priestesses in all ; and the fare was luxurious even for the proverbially voracious priesthoods ; otherwise a writer four or five centuries later would hardly have troubled to record it. But still it would be easy to select various banquets of modern times, equally costly, which still hardly excited attention ;

and this sacerdotal dinner is not comparable with examples of eighteenth and nineteenth century luxury. Between the date of this dinner and Varro's censures the importation of foreign delicacies may have increased. But Horace describes the feast given by the rich Nasidienus to Maecenas and his friends, at which no foreign dishes are mentioned, and his satire is directed, not against the excess of food, but the absurd refinements of these epicures, a passion ridiculous to the poet, who loved simple dishes most and vegetarian fare, in accordance with the precepts of Epicurus.

As Tacitus says, the battle of Actium marks the beginning of the great epoch of luxury, when commerce flourished with universal peace, and extended by way of Alexandria to India and all Asia. At last Rome became a city into which the trade of the world, year in, year out, poured in profusion, bringing 'what every people produced and made' and 'when most distant products could be examined close at hand'. At last the rarest and costliest products of all zones could be lavished on the epicure's table. 'Now,' says Pliny in his pedantic fashion, 'different ingredients were so commingled that each perforce had to tickle the palate with a savour foreign to its own nature, and the result was a general confusion of the products of all zones and climates. In one dish India was laid under contribution, in another, Egypt, Cyrene, Crete and so forth. And even poisons men are not loth to swallow'.

The luxury of banquets in Rome from Augustus to Vespasian was no doubt very great, but Pliny the Elder, Seneca the Younger and others no doubt exaggerate its extent and its profligacy. Much that they utterly condemned, we can condone; much that was to them a heinous innovation is everyday experience to us; and other things had a different meaning in reality.

Great banquets were very costly, but the expense consisted in more than the food; there was the decoration, the service, etc.: the cost is no final estimate of the luxury. According to Kotzebue, an elegant dessert at Paris, which cost 10,000 thalers, employed workers in sugar, decorators, painters, architects and florists. At the Lord Mayor's banquets formerly food and drink cost a half of the total, under George III a third, and at the banquet of 1853 in honour of Napoleon,

only a quarter ; at the last banquet the lighting cost £1,000, the arrangement of tables and chairs £1,860, and the decoration, £1,750. So too Quintus Metellus Pius' splendid feast in Spain (72 B.C.) was extravagant in decoration and fittings. A banquet given by one of Nero's friends cost in roses more than 4,000,000 sesterces (£43,500), but it was winter and they were profusely used ; generally banquets were an occasion of expenditure in flowers, far more lavish than in our days. The great Condé in April of 1676 gave a feast at Chantilly and spent only 1,000 *écus* on carpeting all the rooms with narcissi. But this form of expenditure has grown of late. In England £2,000 is sometimes spent on flowers for a ball. In the table decorations of expert designers for the country houses of the great, baskets of flowers from Nice or Paris are used as a centre for hothouse groupings. The rarest orchids deck 'banquets worthy of a Lucullus' ; and huge posies out of season are sold from three guineas upwards.

Another cause of outlay at ancient banquets was the habit of giving presents to the guests, or distributing them by lot. The raffles consisted of articles of very different value ; at Elagabalus' feasts the guest might win ten camels or ten fics, ten pounds of gold or lead, ten ostriches or ten hen's eggs. In Martial's distichs for such raffles, there are always pairs of articles, one worthless and the other valuable. They might be writing materials, toilette articles, clothes, furniture, crockery, instruments of all kinds (musical included), eatables, games, caged birds, weapons, works of art, books, animals, (such as a trained gerfalcon), slaves ; or such valuable articles as scarlet mantles, ancient wrought goblets, vessels of crystal and *murra*, statuettes of gold or silver, or slaves, such as female dancers, shorthand writers, dwarfs, jesters, cooks, pastry-cooks. At a feast of Lucius Verus (which cost 6,000,000 sesterces, or £63,750) all the presents were of value ; beautiful slaves are mentioned, living animals, dishes of costly material, wreaths of flowers of all seasons with golden ribbons, silver-wrought carriages with yokes of mules and drivers.

The expense of the banquet of Lucullus in the Hall of Apollo may have been 200,000 sesterces, and the Arvales often dined at 100 denarii the cover ; but how much of this represented wreaths, flowers, scents (in which great luxury was shown), light, decorations, uniforms, scenic performances and presents,

we cannot tell. But this outlay at Roman banquets and its refinement was easily rivalled later, as will be subsequently shown. For the present, to take one instance, when the custom of raffling for gifts was introduced into France from Italy in the seventeenth century, at a feast at the Louvre given by Mazarin in honour of the Queen of England, all numbers won, and the greatest prize was a diamond worth 4,000 *écus*; on August 17, 1661, Superintendent Fouquet gave the king a banquet, with jewels, splendid costumes, costly weapons and horses as prizes.

Further, extravagance in banquets and the high prices paid for single delicacies are, in imperial Rome, to be ascribed not only to debauchery, but also to fashion, ostentatiousness, and the desire of being talked about among *gourmets*; and so too with other forms of luxury. 'Spendthrifts', says Seneca, 'devote their whole lives to becoming the topics of conversation, and deem lack of notoriety failure. Everything they do must be rumoured abroad, or they are discontented. Many there are who squander their property or keep mistresses; but to have a name amongst such, the extravagance must be committed with a certain *éclat*; in so busy a city ordinary dissipation is not worth gossiping about'. 'You are not content, Tucca,' says Martial, 'to be a glutton; you want to appear one and be known as one'. This striving after notoriety induced the spending of huge sums on *mulli* (barbel) of extraordinary size, often mentioned as a proof of unexampled luxury. Thus one Publius Octavius, an eminent man, bought for 5,000 sesterces a barbel weighing 5½ pounds (Roman), and the glory of having something too dear even for the emperor Tiberius and his rival Apicius; and 'thus gained much repute with his peers'. Such fancy prices were determined by the purse of the purchaser. Juvenal speaks of people who look through all ingredients and delicacies, and, regardless of price, express a preference for what costs most, ruining themselves to have dishes brought to table worth 400 sesterces. This sum (£4 7s) was considered prodigious—proof sufficient of the lower standard of luxury in food at that time. In fact, one litre of the rarest tit-bits, only used in small quantities, a fish-sauce called *garum* made out of the inside of the tunny fish and manufactured at Cartagena, only cost £1 13s. in present currency. In 1596, at a time of famine, banquets were given at Paris, at

which the dishes cost 45 *écus* or 440 francs ; at a supper of the Maréchal de l'Hôpital, in Mazarin's day, each dish cost 400 *écus*. In St. Petersburg under Potemkin the grandees gave as much as 300 roubles for a fish soup made of sturgeon, the special delicacy at their banquets. Potemkin himself for a time, when prices were low, spent 800 roubles a day on his board, and, at his balls in 1791, spent 14,000 a night, when a fish-soup worth 1,000 roubles was set on table in a silver dish weighing 300 pounds. The cost of a giant trout and sauce sent by the city of Geneva to Chancellor Cambacérès was assessed by the exchequer at 6,000 francs. Pliny says, with some exaggeration, that cooks in his day cost more than erewhile triumphs ; but their wages would work out at much less than those in modern Paris or London. Antoine Carême served in the kitchens of Lord Stewart, Talleyrand, Rothschild and the Emperor Alexander, and at the Russian Court received 2,400 francs as monthly salary, and his bills came to 80,000-100,000 : some letters recently published show that some cooks in England received £1,200 a year. Seneca stigmatizes as monstrous a 'famous dish, the talk of the city', containing the finest delicacies, such as were usually served up separately—oysters and other shell-fish, sea-urchins, boned mullets—mixed together with one sauce, so as to be indistinguishable : 'no vomit were so well commingled'. If such a dish excited such interest, Neronian cookery must have been far less refined than modern French cuisines. Publius Servilius Rullus, in Sulla's time, introduced the fashion of serving whole boars, even when the guests were few—a fashion, too, of the Regency in France ; this coarse luxury (much in vogue in the Elder Pliny's time) makes us doubtful of the refined taste of the Roman table, since swine, wild and tame, prepared in all sorts of ways, were at all times a favourite meal. One well-known dish, invented by Aelius Verus, was a special favourite of the *gourmet* Hadrian, and also used by Alexander Severus ; it consisted of a pie of pheasant, peacocks, boar, or the udder of sows and ham.

Further, the use of emetics after meals is by no means so convincing a proof of gluttony or intemperance, as it appears to modern ideas. Caesar was conspicuously temperate, but took an emetic after a heavy meal with Cicero, who mentions it without any disapproval ; it follows, not that men com-

monly ate with bestial gluttony, but that what we now regard only as a medicine, was then a usual dietetic, like bleeding and purging with our forbears. 'Every one' says Seneca, 'knows his own bodily defects; hence one man will relieve his stomach with an emetic, or another strengthen it with good food, or another empty and purify it with a fast'. The ancient Egyptians, according to Herodotus, were the healthiest of mankind, and three days in every month used emetics and clysters; the great Greek physicians, such as Hippocrates, recommended regular vomitives and purgings, and later doctors mostly concurred, only deprecating their abuse. Asclepiades indeed utterly condemned the use of emetics in his book on health; and Celsus did not blame him for being forced into this attitude by men who took them daily; he disapproved of them as an aid to gluttony, but he knew that, as an occasional resource, they were conducive to health. So too Archigenes, a famous physician under Trajan, commends their use two or three times a month, and Galen before, rather than after meals. Pliny and Plutarch only advised emetics in actual disease. But, amongst those devotees of the belly who lived to eat, who had seven courses even when alone, knew how to prepare fine dishes and were such connoisseurs that they could tell at the first taste from which shore an oyster hailed, there may well have been many who 'vomited to eat, and ate to vomit, and did not deign to digest their repasts furnished from all parts of the world', at least under Nero, when Seneca wrote these words. But the exaggerations and generalizations of prejudiced writers do not justify a belief that this disgusting habit of daily vomits with all its evil consequences was common in wider circles, even at a time of debauchery, let alone in later days. Of the Emperors, whose habits the biographers have described to the most trifling details, Vitellius, the abnormal glutton, and Claudius are the only ones who habitually used emetics. And perhaps he was no worse than Charles V, whose 'heroics in gluttony' forced his 'horrified' doctor to recommend plenteous senna and rhubarb, after a four days' gorging.

§ 2

These considerations show that luxury at table under the Empire has been stigmatized as frightful and unnatural

only because exceptions have been taken to prove the rule, and the diatribes of the ancients against gluttony, and the facts alleged by them have been accepted without reserve, and without the qualification of the proper standard for the time. The question remains, whether, and how far, Roman luxury has been surpassed since the fall of Rome. In addition to what has been stated, the following facts will assist the argument.

In the Early Middle Ages, under the Khalifs, banquets were profuse in delicate foods and splendid appurtenances. The son of Gabryl, the physician of Haroun al Rashid, in the summer used to dine in a room cooled with snow, and in the winter in a conservatory warmed by logs of fragrant wood, and ate such luxuries as roasted fowls stuffed with almonds and pomegranate juice. At the Circumcision Feast of the son of Khalif Motawakkil the carpet was of gold-stuff, worked with jewels: on it were figures made of a paste of amber, aloes and musk; each guest had heaps of gold and silver pieces poured out before him, from which he could fill his pockets at pleasure, and, on leaving, each received a dress of honour. In Moorish Spain, with all its artistic luxury, cookery attained a high stage of refinement.

In Christian Europe and Germany the cloisters were the homes of good eating. At feasts pheasants and peacocks were favourite dishes; both are mentioned in the kitchen accounts of the eleventh century cloisters on the lake of Constance. Foreign foods and ingredients were also imported; at Hirschau under Abbot William (1069-1091) a number of foreign fishes and fruits (lemons, figs, and chestnuts) and roots such as pepper and ginger, were known and used. Peter of Clugny about 1130 complained that many monks were not content with home foods, but sought for foreign ones. And medieval barons kept a sumptuous table, having even (like Nero in his Golden House) ceilings that showered down fragrances and sugared cakes on the guests.

In France the art of cooking was well advanced in the fourteenth century, and progressed more in the fifteenth. The cooks of the famous school of Charles VII's cook Taillevent, aimed at making dishes artistically attractive, and disguising the nature of the viands. The principal course consisted of sweets, a peacock, a pheasant or swan, in its skin and feathers,

with a gilded beak, carried on a lofty dish. The peacocks were brought in to the sound of trumpets and the clapping of hands, and were a favourite roast until the sixteenth or seventeenth centuries, when turkeys and pheasants supplanted them. At the marriage of Adam Geizkofler, a native of the Tirol, legal adviser to the Fuggers in 1590, six turkeys and seven peacocks were served up. In Spain, peacocks fattened with nuts were eaten in old-fashioned houses as the principal course, down to 1815.

In England the reign of Richard II was an age of luxurious food; the ordinary dinner of a man of rank at the end of the fourteenth century consisted in three courses of seven, five and six dishes each; at greater feasts eleven, nine and twelve dishes. The fifteenth century also distinguished itself in this way. When George Neville was made Archbishop of York in 1466 there was a huge banquet, at which were devoured 4,000 cold game-pies, 104 peacocks and 200 pheasants.

The greatness of Italian luxury at feasts in the fifteenth century may be illustrated by a description of the one given by Benedetto Salutati, a Florentine, grandson of the famous chancellor, and his associates, February 16, 1476, to the sons of King Ferrante in Naples. The staircase was decked with embroidered carpets and wreaths of yew; the great hall decorated with tapestries; from the canopy, which was in cloth with the colours of Aragon, two candelabras of carved and gilded wood hung down. Opposite the main entrance, on a platform covered with carpets, stood the dining-table, spread with the finest linen over a worked cover. One side was taken up by a huge sideboard, on which were set out eighty ornamental pieces of plate (besides the silver table-service), mostly of silver, some gold, and three hundred plates of various kinds, bowls, beakers and dishes. To the sound of drums and fifes the guests sat down. The *hors d'œuvre* consisted of a little dish of gilt cakes of pineapple kernels, and a little majolica bowl with a milk pudding. Eight silver dishes of capon's breast jelly, decorated with coats of arms and mottoes; and the principal guest, the Duke of Calabria, received a dish with a fountain in the middle, spraying forth a shower of orange-flower water. The first part of the banquet consisted of twelve courses of various meats, game, veal, ham, pheasants, partridges, capons, fowls, blancmange; at

the end, a huge silver dish was set before the Duke, who took off the cover and released a number of birds. On two magnificent salvers there were two peacocks, apparently alive, with tails spread, burning essence in their beaks, and the Duke's arms attached to a silk ribbon on their breasts. The second part of the feast consisted of nine courses of various sweets, tarts, marchpane, light and delicate pastry with hippocras. The wines were mostly Italian and Sicilian; between every two guests was placed a list of the fifteen brands. At the end of the banquet, every guest was handed fragrant water to wash his hands; then the cloth was removed, a large dish was put on the table, containing a mountain of green twigs which gave forth fragrant scents, whose perfume filled the hall. During the meal and after, the guests were entertained with music and a dumb-show. About an hour later, dessert was served; sugar designs in silver vessels with covers of wax and sugar, in which there were coats of arms and devices. Towards the fifth hour of the night the guests left, after having stayed nearly four hours.

In the sixteenth century, Venice perhaps indulged in the most gorgeous feasts in all Italy. In 1552 Cardinal Grimani, a nephew of Julius III (Ranuccio Farnese) gave a banquet for a hundred guests; ninety dishes were served up and the dinner lasted four hours. The Venetian burghers generally spent 400 or 500 ducats on city banquets. Not only spices and scents were lavished, but gold as well. At a breakfast to King Henry III in the apartments of the Ten, everything was of sugar, including table-cloths, covers, plates and even bread. The banqueting halls and tables were extremely artistic and splendid. Some of the centre-pieces represented white peacocks, with tails spread, quite life-like, overhung with ribbons of gold and silk of all hues and gilded sugar, with scents burning in their beaks and love-mottoes between their feet; figures in marchpane three palms high, and so forth. Songs, poems, operas and other entertainments served to enliven these banquets.

The biographer of Agostino Chigi has described three of his banquets, at which Pope Leo X was present. After one fairly modest one (it only cost 2,000 ducats), seven heavy silver dishes were missing, but Chigi forbade any search, and was surprised that so few were missing out of so many. At another

banquet given in the summer on a colonnade on the Tiber, nets were spread in the river, and after each course all the silver used was thrown in before the eyes of the guests, in order that none might be used twice ; the remains were given to the numerous crowd. At the third, the Pope and twelve cardinals and other great men were present, and every guest found his arms faultlessly engraved on the silver off which he was eating, and couriers had been despatched in time to bring the best dish of his country, prepared on the spot, to each guest fresh on that day.

Towards the end of the sixteenth century, according to the cookery-book of Bartolommeo Scuppi, the cook of Pius V (1566-1572), ' banquets were of four courses : the first of sugar fruits and tarts, representing the Papal arms, and filled with little birds. The rest were composed of all manner of dishes : birds in their feathers, capons cooked in bottles, fish, venison, meat, sweets in alternation, quite contrary to our culinary notions. There were dishes made with rose-water ; on the same dish the most varied ingredients might be combined. The union of opposites was the triumph of culinary art. Before dessert, the cloth was removed ; hands were washed ; the table was covered with sugared eggs and syrups, which sent forth numbing fragrances. At the conclusion, bouquets were distributed'. Fragrances played a great part then in cooking ; Montaigne, who loved them, speaks with approval of their use for meat dishes. At a visit of the Bey of Tunis to Charles V at Naples, the Bey's dishes were filled with spices so costly, that two pheasants and a peacock cost 100 ducats ; when they were carved, the room and the entire palace and the neighbouring houses became redolent with a pleasant smell, that lasted some time.

Indeed, in every art and in cuisine Italy in the sixteenth century was the first nation in Europe. Montaigne says of the domestic steward of Cardinal Carafa, an Italian : ' He delivered me a lecture on the science of gorging, with a magisterial air, as though pronouncing on some great theological problem. He unravelled the differences of appetite ; how a man feels before the meal, and after the second, and after the third course ; how these various states of feeling may be artificially satisfied and excited. He discussed the management of sauces ; first generally ; and then, in particular, on the

qualities and effects of the ingredients ; the difference of salads according to the season, and which should be served up warm and which cold ; how they should be dressed, to make them pleasant to the eye. And he lost himself in deep and beautiful thoughts on the arrangement of the table, and used a rich and splendid vocabulary, such as befits a statesman, speaking on affairs of State '.

In the sixteenth century French cooking also had made great advances ; but, under Louis XIV 'French cookery legislated for all Europe '. Substantially it was founded by Taillevent, but owed much to Italy ; nevertheless, it still seemed imperfect to contemporaries. Of its variety a *menu* may testify at a banquet given by Louvois, the Minister of War of Louis XIV, to the dauphin and several other members of the Royal family : 11 *potages différents*, 11 *entrées*, 13 *hors d'œuvres pour le premier service*, 24 *plats d'entremets*, 11 *hors d'œuvres de légumes, d'omelettes, de crèmes, de foie gras et de truffes*. The dessert is not mentioned. The feast given by Superintendent Foucquet on August 17, 1661, at his Castle of Vaux to the King cost 120,000 livres. It was arranged by the famous cook Vatel. 80 tables and 30 buffets were put up, 120 dozen serviettes were used and 500 dozen silver plates, 36 dozen silver dishes, and plate of massive gold. Afterwards, Molière's *Les Fâcheux* was played in the garden, Molière himself acting. It concluded with a magnificent display of fireworks. Mme. de Sévigné's account of Vatel's suicide in April, 1671, shows the importance attached to cooks and their art. The feast given by the great Condé to Louis XIV at Chantilly cost 180,000 livres (the fireworks alone coming to 16,000), but there were some trifling mishaps ; the sea-fish ordered from all the harbours did not arrive in time ; and thus 'the great Vatel, this genius, who could have borne all the burdens of State, would not survive his imagined disgrace ; and stabbed himself '. He is the ancestor of the long line of great French chefs, inscribed by History on her rolls : an honour which in imperial Rome's greatest days of luxury fell to gladiators and charioteers, but never to cooks.

Under Louis XV the cuisine was already at its height ; connoisseurs say, at its best towards the end of his reign ; according to others, not until Louis XVI. In 1873 all Paris talked for a whole fortnight of a supper given by the *gourmet*

Grimod de la Reynière (junior) for twenty-two people. Of the nine courses, each consisted of one kind of meat, prepared in twenty-two different fashions.

Anyhow, the eighteenth century was the age of 'great cooking and cooks', one of whom was Marin, the *chef* of Prince Soubise, the author of the *Dons de Comus* (with a preface by the learned Jesuit Father Brumoy, translator of the *Théâtre des Grecs*, 1748). The *chef de cuisine* in great houses had a whole host of assistants. The *maître d'hôtel* presided over the service at table in rich garb, a sword at his side, a diamond-ring on his finger, a pouch of perfumed snuff in his hand; sometimes he had to state that his master had spent 100,000 *écus* in the past year. One single dinner given by Soubise to the King and the court cost over 80,000 livres. Many recipes went by the name of great personages who designed them. In Prince Condé's kitchen 120 pheasants a week were consumed; 152 *hommes de bouche* travelled in advance of the Duke de Penthièvre, when he went to open the States of Burgundy.

The Regency, if not the time of the best cooking, was that of the greatest gorging: nobody thought of anything else, according to a contemporary. In the middle of the tables of that day were huge mountains of meat, and pyramids of game and birds; a whole young boar, a roast loin of veal with three fowls and six doves round it, a haunch of venison with all kinds of game, a great sturgeon with mullet. In Law's time this extravagance reached its height. 100 pistoles would be paid for a litre of peas. In Lent, 1720, the butchers' supplies were unequal to the demand. At one Parisian lady's table an ox, two calves, six wethers, etc., were consumed every day.

Fashions of table decoration varied much, from artistically arranged and ornamented centre-pieces, to imitation flower-beds in clay planted with cut flowers, or designs of buildings, statues, and landscapes. A certain Carade invented a hoar-frost which melted in the heated room and made 'the river thaw, the trees turn green, the flowers bloom, and spring follow on winter'. Under Louis XVI 'sableurs' used coloured sand or marble-dust, powdered glass and sugar, and fashioned Persian carpet patterns with marvellous rapidity before the guests came in, to vanish at a breath or a drop of water.

The Revolution scarcely affected this luxury; under the

Directory extravagance was as great as ever. Barras is said to have had mushrooms brought from the mouth of the Rhône by express messenger, and Danton gave banquets at 400 francs per cover.

German Society, as in all else, imitated France in the arrangement of the table. Lady Montagu, when at Vienna in 1716, often dined with the aristocracy off more than fifty dishes, all of silver, and dessert on the finest china on the same scale; eighteen choice wines, of which lists lay on the table, were handed round. But even amongst the middle class of that time of poverty luxury at the table was common. 'For an ordinary friendly dinner', says a writer of 1730, 'five or six delicate dishes suffice; a banquet requires 12-16 courses without reckoning the dessert; for a private individual to give 50-80 dishes is snobbery. For men of rank and ministers of State it is different'. About 1780 in Vienna, the middle class, the lower Court officials, merchants, artists and superior artisans regularly dined on 6, 8 or 10 dishes with 2, 3 or 4 sorts of wines. The *menu* of a dinner given at the investiture of Superintendent Deyling at Leipzig on August 13, 1721, unmistakably shows French influence. At the high table guests 24 in number, including the evangelical clerics, the Council and the *Rector Magnificus*, sat down to a first course of seven dishes: venison pies, partridge-soup, boiled trout, wild rosemary with butter-sauce, *biranges*, *pistachios*, horse-radish, Hamburg meat and beans, two legs of mutton, two craw-fish tarts. The second course consisted of five dishes: pork with six pheasants, a whole deer roasted, a pig's head with ox-tongue, salads, and two *Babtis*-tarts. The arrangement followed a previous plan. At three tables of four and twenty persons, where the pastors sat, six dishes each were served. The lady superintendent also had the following menu for six: a turkey pie, a haunch of venison with two roasted partridges, boiled trout and a currant tart. The twelve musicians and 32 waiters had four dishes each. The sweets consumed were: at the first table, 30 almond tarts, 30 meat-tarts, and 30 dishes of confectionery; at the other three tables, a basket of sweets, an almond tart, a meat tart; and at the lady superintendent's table, fruit as well. Three pails and six cans of Rhine wine, one pail of old Rhine wine, two casks of Wurzen beer, three-eighths of a cask of Lobgünn beer were drunk. This was

certainly at the cost of the city, but gives an idea of how the average rich citizen of Leipzig then lived.

But in all Germany luxury was at its height at Hamburg ; a writer of 1780 calls it 'excessive'. T. H. Voss has written an idyll on a 'rustic' supper given by a merchant of Hamburg in 1778. He first describes the *Canditor* table design, a rich landscape with figures of men and animals, and then the dishes, of which twelve were ready on the table : 'some cold, and some simmering on marble, and hot dishes in silver receptacles'. The menu was : pheasants and Indian bird's-nests and *asia*, young turkeys and soy, trout boiled in wine, cod with oyster-sauce, a sucking-pig in jelly, partridge-pie from Bordeaux stuffed with truffles, different vegetables, and fresh herrings, lobsters, Elbe salmon, Paderborn ham, Göttingen sausages, a *ragout* of scollops, lambs' tongues, pineapples and capers, a haunch of Harz venison, a hare, a red grouse, ortolans, a rich dessert, including apricots and peaches from Potsdam. The wines were comparatively few : Rhine wine of the sixties, Pontac and Burgundy, Silleri, Tokay, and Cape wine. At Hamburg, according to the same authority, it was the rule to have a special wine for every course, not only at feasts, but at the ordinary meals in wealthy households : 'malaga for fresh beans (often costing a ducat a dish) and fresh herrings, burgundy with fresh peas, champagne with oysters, port or Madeira with costly salted fish'.

Examples of Sarmatian luxury with its crude excess, massive but tasteless gorgeousness and boundless extravagance are found in the feasts of the Polish nobles of the eighteenth century under Stanislaus Augustus at Warsaw. In 1789 Prince Charles Radziwill gave one of the most splendid. Four thousand invitations were issued. In the hall, where the King dined, all the dishes were of gold ; in three others transformed into one, there was a long table with magnificent silver plate of Augsburg filigree work ; the long sideboards were also filled with silver ; the carpets and liveries were equally gorgeous. The fare was plenteous, beginning with oysters specially transported from Hamburg : some hundred dishes of them were consumed. The cost of the banquet was about 1,000,000 marks.

Potemkin's feasts perhaps surpassed all. The extravagant luxury of fare and service render them almost fabulous. At

a banquet given to Catharine on April 1, 1791, at St. Petersburg, the Court expended 16,000 pounds of wax for candles, and 70,000 roubles worth of wax in addition was brought from Moscow. The winter garden was six times as large as that in the Imperial Palace, was laid with artificial grass, gravel paths, fruit-trees with glass fruit, jasmine bushes, mirrored grottoes, an *eau de lavande* fountain, an obelisk of crystals and precious stones; in the grass were nests of singing-birds, and bowls of gold-fish, lanterns shaped like pine-apples and melons, and a temple with six columns supporting a statue of the empress. About 3,000 guests were invited: many thousand roubles were given to the people; the ballet masters La Pica and Canziani received 5,000 and 6,000 roubles. The estimate of 200,000 roubles for the whole is far too low.

In North America luxury at table was also great: in 1775, when paper money still stood high, in Philadelphia £800 was spent on pastry alone.

The tradition of the cuisine of the eighteenth century was followed in the nineteenth, especially by the gastronomes of France. In 1803 Grimod de la Reynière's *Almanac des Gourmands* appeared, and sold enormously, called by the Duke of York 'the pleasantest book published'. Macaulay knew much of the eight volumes by heart and amused his guests by quoting, e.g., that oysters weary after the sixth dozen, or dishes '*du potage brûlant tel qu'il doit être* down to '*biscuit d'ivrogne*'. In France Talleyrand's house was *la première maison dînante*, and the dinners at the Foreign Office in the Rue de Varennes were, according to Carême, only equalled by those of the chancellor Cambacères. According to Kotzebue (1804) the latter consisted of 70-80 dishes, which a Lucullus or Apicius would not have disdained. The cooks were worthy descendants of their predecessors, were equally valued, and as convinced of their high importance to society. The Marquis de Cussy, the Court supervisor of Napoleon's kitchen, boasted of knowing 365 ways of cooking a fowl. Antoine Carême refused the post of *chef* to George IV at a clear salary of £500, full disposition of the kitchen money, fifteen holidays a month, and a pension. He dedicated his work on *French Cookery in the nineteenth century* to Lady Morgan, who in her book on France had glorified a dinner given under his supervision by Baroness Rothschild on July 6, 1829, and said that many

epics required less genius than one such dinner. In his dedication he said something more than wealth inflamed him. At all times some disinterested men had sacrificed all to develop art or industry. Enough for him if his great work lightens the heavy labours of the cook.

In the first half of the nineteenth century the expense lavished on meals was as great as ever. Macaulay in 1833 found the Annual Fishmongers' Company Dinner only fairly good ; formerly it had cost £10 10s. a head.

The importance of gastronomy a generation ago is proved by a large gastronomic literature with classics in Grimod de la Reynière, Rumohr and Brillat-Savarin, who are more easily paralleled in Greek antiquity than in Roman. Even a Byron condescended to devote a series of stanzas to a banquet.

Luxury in food then increased from 1800-1850, and the gigantic progress of commerce since then has developed it yet more. On February 5, 1877, at a banquet given at the Berlin Exhibition of Cookery, some of the dishes were : Périgord truffles, Cancale oysters, Volga caviar, trout from the Lake of Garda, sturgeons from the Black Sea, elk buttocks from the Forest of Bialowicz, Indian bird's-nests from Bombay, sea-crawfish from Ostend, snipe from the Pyrenees, Scotch partridges, Florentine quails, Italian pears, Tyrolese apples, Spanish grapes. Zola in his *Pot-Bouille* describes the dinners at the Café Anglais, at 300 francs a head, consisting of delicacies of every clime ; a 'royal choice' of wines, and unseasonable and costly foods, partridges in July and peaches in December. But Chinese cookery seems to pride itself even more on distant delicacies, transported with difficulty ; at least a Hong Kong dinner on March 6, 1877, is thus reported : 'one kind of mushroom came from the South Polar Ocean, whale sinews from the Arctic, shark-fins from the South Seas, and bird's-nests such as only occur in one cave in one island'.

A tirade against luxury and exotic delicacies were much more justified now than in the days of Varro, Sallust, Pliny and Seneca ; an Apicius would feel small at a modern banquet of a modern capital !

II. THE IMPORTATION AND USE OF EDIBLE ANIMALS AND PLANTS

§ 1

Luxury in food, both in Roman and modern times, was not merely deleterious or useless ; it caused the importation of foreign plants and animals into the countries of the West, improved the standard of living, and so helped to spread and promote civilization.

Even under the Republic many of the animals and vegetables for the tables of the rich were grown in Italy. Uncompromising opponents indeed censured both the acclimatization and the purchase of foreign fish and birds. Under Tiberius Optatus Elipertius, Praefect of the Fleet, succeeded in breeding a fish, the Scarus, found in the seas between Rhodes and Crete, on the Italian coast between Ostia and Campania. In Pliny's time it was plentiful ; he says : ' Gluttony has then secured its delicacies by sowing the seas, and giving them new inmates ; one need not be astonished if foreign birds breed in Rome '. Making a profit out of luxury in food the severest censors did not disapprove ; Varro even gave careful instructions for artificial breeding of game, birds, fish and shell-fish, including exotic ones, such as the African guinea-fowls, Gaulish and Spanish hares and rabbits, Illyrian and African snails.

And, according to Pliny, it was greed of gain and not gluttony that made Sergius Orata invent an oyster-bed in the Lucrine lake, though others, before him, had unsuccessfully attempted artificial breeding. Aristotle says that some Chians from Pyrrha in Lesbos had taken living oysters and put them in similar spots in their own seas. After some time, they grew bigger, but did not fertilize. Outside Italy, ancient oyster-beds have only been found at Bordeaux. But what was then the speculation of a few is now an important livelihood for whole districts, and a considerable part of the revenue, as well as a problem deemed worthy of the serious efforts of naturalists. The French Government actively subsidizes a flourishing oyster-trade by artificial breeding, as perfected by Coste ; in the Lago di Fusaro primitive methods still obtain and prosper.

The animals acclimatized by luxury in Italy were mostly birds. The peacock, which Hortensius was the first to eat

as a roast, had been long known. The increasing demand led to peacock-breeding as a farm industry. The little islands off Italy, even in Varro's days, were turned into peacock-isles, and peacock farms were laid out on the Continent as well. In Athenaeus' time Rome teemed with peacocks. The guinea-fowl (*Numidica, gallina Africana*) was already eaten in Varro's time, but rare in Italy and expensive; in Martial's day it was common in the larger poultry-yards. As early as Ptolemy Euergetes II pheasants were imported from Media (i.e., from the South Caspian countries) to Alexandria, but are not mentioned as Roman delicacies either by Varro or Horace; they were not introduced until the beginning of the Empire. They are always spoken of as imported from a distance; but Martial expressly states they were bred in Italy by 90 A.D.; the same was the case with flamingoes, which, however, are rarely referred to; Apicius may have initiated their consumption, or, anyhow, made their excellent tongues well known.

Poultry-yards are quite within the means of the small cultivator, but in Italy were on a larger scale. To-day too 'the Romance peoples in accordance with locality and tradition are the greatest eaters and breeders of birds.' 'In Italy during the Roman period there could be no talk of abundance of game, as in the German forests, and the Northern moors, whence distance and the warm climate forbade the transport of big game and large birds. Thus the Romans had to be content with artificially rearing delicate birds to a more or less complete state of domestication, but all on an immense scale. Modern attempts at breeding have not followed this example; though the wilderness in modern Europe has been continuously driven further back, railways now bring the slaughtered game from distant deserts with lightning rapidity to the centres of consumption: the Paris market fetches its partridges from Algeria and Northern Russia'.

More extensive than the importation of animals to Italy was the acclimatization of fruit trees and vegetables, which thence spread to other countries. But here again later antiquity only followed in the tracks of early antiquity, and further extended the foreign plantations, thus, in the course of the ages, transforming the vegetation of South and Central Europe.

Grapes were grown in Italy from the earliest times; but the Greek colonies on the coast must have fostered them; the

vine 'flourished so abundantly on the hills of Lower Italy, that Sophocles in the fifth century B.C. could call Italy the favourite land of Bacchus'. Olives, too, were a Greek importation; if Pliny's statement from Fenestella, the chronicler, be correct, dating from the time of the Tarquins. But the fig is probably as old as Greek colonization. In Varro's time, Chian, Lydian, Chalcidian, African and other foreign figs had been introduced into Rome. Under Tiberius Syrian figs were transplanted to Italy. Cato already knew of the almond as the 'Greek nut', and perhaps, also of the chestnut (*nux calva*): 'in any case, the want of a settled nomenclature forbids the assumption of a general cultivation of these trees in Italy of that epoch'. Virgil is the first to mention chestnuts; and Varro and Cicero walnuts (*iu-glandes*); the name '*amygdalum*' first came in under Augustus. Cato mentions the plum only once; it was commonly cultivated under Augustus. Pliny mentions a confusing number of varieties, and says that the best, the Damascene, had long been grown in Italy, and another Syrian sort only recently. Pomegranates were common in Italy in Cato's time; and quinces (which the Greeks derived from Crete) were also old in Italy. Cherries were unknown to Cato, and Lucullus first imported them from Pontus to Rome; Varro mentions them once, and later authors frequently. This cherry was a novelty in Italy, and may have been a larger, better, and juicier morello cherry; wild sweet cherries (*prunus avium*) were indigenous, for remains of them can be clearly traced in the pile-dwellings in the valley of the Po; a superior kind of cherry was cultivated in Asia Minor as early as King Lysimachus. 'Both sorts were rapidly propagated, imported largely from Asia, grafted on to the native wild stock, and a number of cross-species produced'.

As to flowers, 'the Oriental garden-rose came in with the Greek colonies, and with it the lily as well', thence to be exported everywhere. 'Besides roses, lilies, violets, the Eastern crocus (indigenous in Cilicia) were found in Roman gardens'. 'But crocuses were foreign still; their cultivation a great feat, like that of casia, incense, myrrh, with which Columella puts them. According to Pliny saffron did not do well in Italy', though often found. Of edible plants of the East, Cato does not mention the *medica* and the *cytissus*; Varro does: they must have been introduced in the intervening century.

Thus Italy, even in the last centuries B.C., and the ancient world generally, must have been 'an artificial garden'. Varro already could call Italy a great orchard, while the elder Greeks (from the Peloponnesian War down to Alexandrian times) 'knew the peninsula as a country northern and primitive in character, in comparison with their own and the East, producing mainly corn, cattle and wood. Now, in the stead of vast barren forests and wildernesses with their produce of wood, pitch, game and pasturage, there were plantations of oriental fruit trees; in the stead of the old flesh and pulse diet, the delicious fruits of the South and the East. The factors of this change were largely Asiatic slaves and freedmen, Syrians, Jews, Phoenicians and Cilicians; horticulture and delight in the quiet, gentle occupation of training and tending plants were an old inheritance of the Aramaic stock'.

The increasing commerce under Augustus naturally augmented the stock of foreign plants. Columella says that Italian industry raised in Italy nearly all the fruits of the world. Amongst the plants imported in the Early Empire were, perhaps, the African lotus, Ascalon shalots, certainly peach-almonds, and peach-nut apples (planted and imported by Sextus Papirius, consul in 36 A.D., from Africa and Syria), the *colocasias* from Egypt, Syrian radishes, East Indian millet (Syrian radishes shortly before Pliny wrote, and the millet at least ten years before); rice and maize only came in about 1500. 'By about 50 A.D. industrious gardeners had planted apricots and peaches, and charged a high price for their first Persian apples and Armenian plums'. Pistachio nuts and other garden fruits were transplanted from Syria to his estate near Alba by Lucius Vitellius, the father of the Emperor and legate in Syria under Tiberius. Melons were imported in the first century of our era into the gardens of Naples from the oases on the Oxus and Jaxartes; Pliny describes the wonderful new Campanian *meloepones*, Later imperial biographers call them *melones*. It is doubtful whether the carob tree was naturalized in Roman times. But the citron tree, which produced the medical apples (*arbor citri*, *citrus medica cedra*), which were admired as the fruit of the Hesperides, was really acclimatized in Italy in the course of the first centuries. Pliny mentions unsuccessful attempts to transport trees in clay or perforated tubs to Italy; but Florentinus (about 200 A.D.)

speaks of citrons being grown in hot-houses, walled off, as at the present time in upper Italy, towards the North, and covered with mats in the winter ; and Palladius (in the fourth or fifth century) saw citron-trees growing in the open in Sardinia and Naples, on specially good soil. And the latest ingenious and learned investigator, who sees in the Empire only a period of rapid and irremediable decay, acknowledges 'the progress in many less obvious branches of human activity, such as the exchange and utilization of the natural products of the most various countries'. The lemon and bitter orange came in in the time of the Crusades, the sweet orange (*portogallo*) through the Portuguese in the sixteenth century, and the mandarin in the nineteenth from China.

The cultivation of fruit and vegetables, and the development of their varieties seemed to Pliny to have reached the limit of possibility in the Early Empire. From his point of view, he should have condemned the acclimatizing of foreign growths, as much as he did disapprove their commercial importation (e.g., pepper from India). But he never does, partly because the opponents of luxury preferred vegetarian to meat diet, and hence were more tolerant of the development of varieties of plants; partly because to censure the centuries of useful industry in this direction seemed ridiculous. The use extreme luxury was to make of acclimatization was not as yet suspected. One example out of modern times may suffice. In 1806 the *Almanac des Gourmands* announced as a triumph of civilization that real *maraschino* had been made in France. A manufacturer at Grasse had transplanted the cherry-tree grown at Zara for the purpose ; after fifteen years' costly experiments he had acclimatized it ; and the new *maraschino* was pronounced better by connoisseurs than the Dalmatian. The same man had himself fetched a root used in distilling from England, and grown it at Grasse. 'Blessed', says the writer, 'be this industrious and intelligent citizen, who combines his own interest with the common weal, increases the enjoyments of the most spoiled palates and promotes the prosperity of his home. This is patriotism *in excelsis*. M. Fargeon is a patriot in the most honourable sense, a word degraded by the civism of our Republican revolutionaries, and rehabilitated under the Restoration'.

But if Pliny condoned acclimatization, he would not alto-

gether sanction artificial gardens and orchards, on the ground that every advance was a step away from Nature, and, therefore, made the unnaturalness of these growths more apparent. He recognizes that improvement of edible plants and fruits conferred a benefit even on birds and wild animals, but complains of the fruit being taken from the poor in consequence of the 'adulterous conjunctions of trees'; grafting being brought to such a point that the revenue from a fruit tree near Rome (2,000 sesterces, £21 3s.) exceeded that from an estate in former times. And if we allow fruit to be grown so large, so flavoured, and so strangely shaped as to be beyond the reach of the poor, 'must differences be invented even in vegetables, and must wealth introduce grades in dishes that only cost an *as*? Must asparagus be grown so thick, as to be too thick for the poor man's table? Nature let wild asparagus grow, which any one might reap; artificial kinds are now to be seen, and at Ravenna three weigh a pound'. 'What monstrous gluttony!' Even the most profitable cultivations could only be spoken of with a sense of shame; little fields of artichokes (*cardui*) near Carthage, and Corduba bring in 6,000 sesterces a year (£65 5s.): 'we even utilize for the table the monstrous products of the soil, which the cattle disdain'. Nay, more; they are manured, flavoured with vinegar and thin honey and other condiments, so as to have artichokes every day. Although horticulture excited then all this wonderment, compared with modern times, its achievements were meagre. In the great nursery gardens near London about 1828 there were 435 sorts of salads, 261 kinds of peas, 240 species of potatoes, and so on in every article. The prices now obtained are also higher. At a Rothschild dinner in London the dessert alone cost £100. Truffles in ancient times were not liked; the black species was unknown; in France of to-day it is more and more extensively cultivated and exported, and is called the black diamond. In 1865 the export was 104,000 pounds to Russia, England and America, in 1866 120,000; in 1867 140,000. One Carpentras firm in 1832 disposed of 15,000, and in 1866 of 109,000. Incidentally narcotic luxuries may be mentioned. On tobacco from 1882-1883 Germany spent £15,650,000 (and £17,250,000 on the army); in England in some cases £5 a day is spent on cigars.

§ 2

Up to now, we have spoken of Italian horticulture only. But, as the centre of a world Empire, it spread these plants further and further afield, and transformed the vegetation and the diet of the provinces. Attempts at acclimatization of all sorts were constantly made, as Galen shows, when he says that plants if removed only two *stadia*, change somewhat, and the same grapes give different wines at different places. The same is remarked on nutritive plants in economic and botanical treatises. Fruit trees crossed the Alps surprisingly fast. In 47 A.D. cherries were grown in Britain, four years after the conquest, and 120 after the first plantation in Italy; in Belgica (between the Seine, the Saône, the Rhône, the Rhine and the German Ocean) and on the banks of the Rhine Lusitanian cherries were considered the best in Pliny's time. Lucius Vitellius first grew pistachio nuts in Italy and his comrade-in-arms, the knight Pompeius Flaccus, acclimatized them in Spain. In Pliny and Columella's time a large kind of spring cherry was being produced in Provence. A *casia* grown for its fragrance in Pliny's time flourished 'on the marge of the Empire, washed by the Rhine', planted in bee-gardens. A shady tree newly acclimatized at Boulogne, was probably not, as Pliny says, the plane but the Northern maple. Germany, too, which Tacitus considered too cold for fruit growing, is indebted for its flourishing orchards to the initiative of the Romans, like England and France.

The most important result of these plantations was the spread of vines and olives. 'When the Roman Empire was defined, its boundaries became almost the boundaries of oil and wine'. But the olive and the vine only advanced slowly at the expense of butter and beer. The progress of Greek and Roman civilization was marked 'by the spread of the noble olive from her home in the south-east corner of the Mediterranean over all the countries where it is now found'. From Marseilles it spread to the Northern frontier, and on to the Ligurian coasts: in the low-lying marshy ground near the estuary of the Po, it could not flourish, but prospered in Illyria and Liburnia; and Istrian oil competed with that from Southern Spain. Into Spain the olive advanced with civilization.

The vine was able to make itself at home much farther North. 'Columella quotes Saserna, an older agricultural writer, as

saying the climate had changed, for realms formerly too cold for vines and olives now had enough of both and to spare'. But the climate had not changed, but their cultivation had spread north, in the course of the centuries; whilst, in modern times, the vine has receded from the north, e.g., the north of France, England, Brandenburg, West Prussia, where it was no longer profitable. From the shores of the Adriatic the grape climbed the slopes of the Euganean hills and the southern declivities of the Alps; Cato praises the wines of Raetia (Tyrolese and Valtelline). In North Africa the Phoenicians had introduced it, Islam destroyed it. According to Strabo, Spain lacked vines, olives and figs almost entirely, except in the south and the east, on the north because of the cold, and in the interior, because of the barbarous inhabitants. The Lusitanians drank beer, and wine was rare there, though already penetrating into the home of port; in Pliny's time Spain was still mainly a beer-drinking country. An imperial official of equestrian rank was appointed in Baetica (Granada, Andalusia and Seville) 'to plant Falernian'. In Gaul Marseilles was the starting-point; the colonies of Marseilles spread vines east and west along the coast, and inland; in the interests of Italian vineyards the Romans soon had to curtail the export of Gallic wine and oil. Immediately after the conquest of Gaul, Caesar began Romanizing the province; there were only imported wine and native beer, and Strabo says the wine is not good, beyond the land of figs and olives, and towards the Cévennes. But in Pliny and Columella, we have 'modern France as an independent wine-producing country, with various brands and exports and plantations of its vines into Italy': they mention Burgundian and Bordeaux wines. During the Empire the vine spread over the valleys of the Garonne, the Marne and all along the Moselle, into Switzerland (an inscription in confirmation has been found on the North shore of the Lake of Geneva near St. Prex between Rolle and Morges) but was scarce on the left bank of the Rhine, and non-existent on the right bank. Probus is said to have allowed free vine-growing in Gaul, Spain or Britain, or perhaps Gaul, Pannonia and Moesia. It was planted on the southern slopes of the Carpathians, on Mount Alma near Sirmium (Mitrovicz) and was the beginning of Hungarian vintage. One hundred years later, Claudian writes of the 'vine-shaded Danube'. But, in anti-

quity, Italy remained the first of vine-lands. Now it is Central and Southern France, and it is in places close to the northern limit of its extension (Burgundy, Johannisberg) that the vine produces its best wine.

Thus, in the Roman Empire, influences could meet and work, which completed the process of assimilation and produced a homogeneous cultivation of the soil in all the Mediterranean countries. Central Europe has to acknowledge its debt to the South in this direction as in 'all sources of our civilization'; and we must not forget that the much maligned Empire played no small part in this great work.

III. LUXURY OF DRESS AND ADORNMENT

Luxury in dress at this time took a different direction than in the Middle Ages and now. The slight extent of manufacture meant a paucity of rare stuffs. The oldest clothing was wool, though linen garments were worn by women, even in the Republic, whilst men at its close and later used fine linen mainly for handkerchiefs. Linen tunics were common in Rome by the third century. The finest linen, or *byssus*, came from Egypt, Syria and Cilicia. East Indian cotton (Sanskrit *Karpāsā*, *carbasus*) was imported to Rome after the Asiatic Wars (191 B.C.), if not before, and muslin was perhaps also in use for clothes. Chinese silk was at first imported only as yarn and raw, but finished articles were broken up, dyed, and woven with linen or cotton into a light half-silk substance. These transparent and gay half-silk dresses were worn in the first century by women and effeminate men: very much later the increase of commerce with the East brought heavy pure silks into Europe; Elagabalus was the first man to wear them. (Satin and velvet were unknown in antiquity; satin (*Atlas* in German, from the Arabic for 'smooth') was an importation from the time of the Saracen supremacy. Together with silk, the similarly Oriental extravagance of silk garments with gold worked in spread, but gold embroidery was found only in carpets, curtains, coverlets and triumphal dresses, or trimmings or insertions in women's clothes. Clothes made of gold and silver stuffs, so common in modern times, were rare in antiquity. The mantle of 'pure woven gold', worn by Agrippina at the naumachy on Lake Fucinus was unexampled, men-

tioned as such by Pliny and Dio and Tacitus : whereas Charles the Bold at the Battle of Granson took with him 400 cases of silver and gold stuffs, including 100 gold-embroidered coats for himself. Furs were used in Italy from ancient times for particular purposes, but they were not common before the Germanic invasion of the South, and they were never extravagantly used, as in the Middle Ages. Marco Polo mentions the price of the sables, with which the halls and rooms of Kublai Khan (1214-1294) were decked, as 2,000 golden bezants, if flawless and big enough to make a dress ; if imperfect, as 1,000. To line a cloak for King John II (1350-64) 670 marten-skins were used ; one of his sons had 10,000 martens brought in to line five cloaks and five ladies' doublets. To line a dress for one of his grandsons 2,790 squirrels' skins were used. This large demand raised the prices correspondingly.

In antiquity, too, there was none of the waste of material in long trains and broad bodices, or any of those studied deformations, so common in medieval and modern fashions, such as pointed shoes, trunk-hose, hip pillows, hoop-petticoats, trains, full-bottomed wigs, which were often costly ; the ordinary wig of a distinguished man cost £7 10s. and often as much as £150. Ancient dress was both more natural and graceful, and, on the whole, fashions were much less changeable. To-day generations differ more than centuries did then. Hence the extravagance of fashion was much less than in the Middle Ages or now. Lastly, ancient dress was simpler, and consisted of fewer articles. In gloves and headgear there was no luxury ; whereas in modern Persia the headgear has to be renewed thrice or four times a year, and costs 60 ducats. All along the south-west coast of America Panama hats are worn ; they practically never wear out, but the best cost up to £50 and ordinary ones £20 or £30. And the seasons occasioned far less change of dress in the south. Some dandies, however, made absurd and trifling distinctions ; thus, Juvenal scoffs at one man who has light summer rings on his perspiring fingers, since large jewels weighed too heavily.

But the hot summer made many changes of suits necessary, as in modern Persia, and the better-dressed had a large wardrobe. Their chests of drawers contained cloaks of every colour possible. The inside of the trunks full of dinner dresses was equally gay ; and a whole tribe could have been clothed with

the *togae* of Apulian wool (Martial). Naturally, too, people often changed several times on the same day. But only one instance of this last practice is recorded, in one of Martial's *nouveaux riches*, who changed his *synthesis* (a dinner costume) eleven times at one banquet, ostensibly, because of the heat, really, to show off his extensive wardrobe. But, in modern times, an unnecessary frequent changing during the day has become common and carried to ridiculous excess. Towards the end of the sixteenth century the clergy in Germany complain of it; at the beginning of the seventeenth a wife left thirty-two full suits, and her husband Hans Meinhard von Schönberg possessed seventy-two, and about the same number of gold-embroidered gloves and twenty-one hats, to which twenty-six sets of coloured feathers belonged. Clive between 1767-1770 ordered 200 shirts, as good as could be had for love or money. Count Brühl carried this affectation to excess; would never wear a dress more than twice, and his accumulations of disused clothes became prodigious. About 1790 ladies changed wigs for every new toilette. About seventy years ago an English dandy used twenty shirts a week, twenty-four handkerchiefs, nine or ten pairs of summer trousers, thirty scarves (when not wearing black ones), a dozen waistcoats, and stockings *à la discrétion*.

Extravagance in bright costly colours, so common in the south, was found in the Roman Empire in both sexes alike. Persius makes one great dandy wear a hyacinth-coloured mantle. Martial tells of one moralist who prescribed dark grey or brown cloaks for men, and declared violet or scarlet effeminate; a hypocrite who concealed vice under a pretence of austerity. Juvenal says that the great retinue with torches and the scarlet cloak of a young noble coming home from a feast is warning enough to keep clear of him. Statius' friend, Atedius Melior, made his favourite page Glaucias always wear the most beautiful clothing, red, green or purple. Scarlet, and still more the various purples, were the most valued colours. One pound of the best Tyrian purple wool, stained twice through, cost over 1,000 *denarii* (£43 10s.); a less valued kind in amethyst or violet only £15. Martial says that the price of a Tyrian purple cloak of the best hue was only 10,000 sesterces (£108 3s.). Hence, if he intends the kind most valued in Augustus' time, prices must have sunk incredibly; Martial

can only be speaking of a second-rate sort. But the genuine purple wool, so much sought after, was also almost everlasting, and, like shawls in the East, may have been handed down for generations. But, most probably, in the Early Empire, whole purple cloaks were very rare. Generally purple was only used in stripes, for galloons, as a trimming, braid, edging, fringe or furbelow. Caesar restricted the use of whole purple garments to certain persons and certain days; Augustus permitted them only to senators holding office, when presiding at their games; and Tiberius endeavoured by his example to enforce obedience to these laws. Nero went so far as to forbid the sale of Tyrian and amethyst purple; but under Domitian, if not before, permission must have been restored. Marcus Aurelius and Pertinax had the imperial wardrobes, which must have abounded with purple robes, sold by public auction.

But the use of purple in Rome cannot be compared with modern extravagance in dress. In Italy, at the time of the Renaissance 'dress was as costly as it was beautiful; the sartorial artists of that time would have looked with contempt upon those of modern times, for real artists worked at that time of artistic development; they worked with the finest velvet, silk, and gold embroidery, whilst painters designed the colours, the folds and the shapes. Hence dress was a thing upon which, as an essential of appearance, the greatest value was placed'. Hence the chroniclers of the great feasts of that time describe very exactly the garments of the great men and women. At a famous tourney given by Lorenzo de' Medici on the Piazza Santa Croce, which on his own statement cost 10,000 gold florins, the dresses were splendid; that of Giuliano de' Medici cost 8,000 ducats. Benedetto Salutati used 168 pounds of silver at sixteen ducats a pound on his horse's trappings, and the jewellery on it was valued at 8,000 ducats. But love of art went with this extravagance: his silver helmet was made by Antonio del Pollajuolo. In the dowry of Lucrezia Borgia at her betrothal with Alfonso d'Este (1501) were comprised, according to a report of the agent of Marchese Gonzaga to his master, a trimmed dress worth more than 15,000 ducats, 200 expensive shirts, some worth 100 ducats apiece, each sleeve with its golden fringes costing thirty ducats. Another writer values one single dress of the bride at 20,000, and one hat at 10,000 ducats. Very great importance attached

to fine dress. The two ambassadors of Venice at this wedding had to appear before the Senate in new robes of crimson velvet with fur-trimmings and capes of similar material. More than 4,000 people stared at them in the great Council Hall and the people thronged round to see them in the Piazza di San Marco. These cloaks (twenty-eight and thirty-two yards of velvet) were the bridal gift of the ambassadors to Duchess Lucrezia.

In the second half of the fifteenth century extravagance on dress in Germany became 'incredible'. According to Geiler von Kaisersberg many a burgher's wife carried on her back, in clothes and jewellery, more than 300 or 400 florins' worth, and had at home over 3,000 worth. In England in Elizabeth's reign, according to a contemporary account, it was quite a common thing for a thousand oxen and a hundred oxen to go to the restoration of a costume, and for a fop to carry his fortune on his back. Towards the end of the sixteenth century extravagance in dress was increased by lace-trimming, embroidery and gold borders, jewellery and pearls: and prices went up tremendously: and £90 might be earned on a single dress. One dress of Marshal Bassompierre was embroidered so richly as to cost over £2,100. In the seventeenth and eighteenth centuries extravagance in dress was scarcely less. At the procession of Queen Christina of Sweden into Rome in 1655, the dresses of the Roman ladies who received her cost 500,000 to 600,000 scudi, and that of the Princess di Rossano 700,000. When the Infanta Maria Teresa Antoinette, the Dauphin's betrothed, entered Paris (1745), the dresses were so expensive that they were only hired. Marquis de Mirepoix hired three for 6,000 *livres*, and only wore one a day: in one gala-coat of Marquis de Stainville, of silver stuff embroidered with gold, the marten's skins for the lining alone cost 25,000 *livres* and so forth. A fashionable lady of that time bought a dress she had ordered and could not afford, on the terms of an annuity of 600 *livres*, and made a contract to have a new dress supplied every day for 24,000 *livres* a year. In France from the Regency to the Revolution the fancy for laces amounted to a passion, even with men; solemn men of all ages were seen with 15,000 or 20,000 *livres* worth of laces on their scarves, frills and cuffs. The lace *alb à point à l'aiguille* worn by the Elector of Trèves John Philip (1756-68) on State occasions at Versailles was valued at 100,000 *livres*. Northern extravagance in dress con-

sisted mainly in wasting valuable materials, furs and jewellery especially. In the splendid dress worn by Adam Rzewuski at his farewell audience of the King as ambassador at Copenhagen, the saddle of his horse is said to have been worth 45,000 gold florins (£20,250). The price of a pair of sable skins in the eighteenth century rose to over 170 roubles, and one skin is sometimes said to have cost 20,000. The value of Potemkin's gala costume inset with jewels is given as 200,000 roubles.

The nineteenth century is, on the whole, apart from extraordinary occasions, the period of least extravagance in male, but probably not in female dress, as is shown by the price of a cashmere shawl (£300), the lace veil of a rich bride (£735), the furs of Empress Eugénie (sent to England after her in 1870) 600,000 francs, or the fabulous expenses of the queens of fashion in the great capitals. And perhaps never before have the artistic ladies' tailors earned as much and ranked as high as under Napoleon III in France, when all the greatest ladies were at their feet. Compared with the *toilettes* of the second Empire, those of the first, when the most elegant ladies (Mme. de Savary and Mme de Maret) spent only 50,000 to 60,000 francs a year, seem almost paltry.

In Roman antiquity extravagance in oriental stuffs and manufactures, used for adornment in the widest sense, such as silk, *byssus*, jewellery, pearls, scents, was at any rate confined to women, and to a very small circle amongst them. Pliny probably bases on the returns of the frontier customs his statement that in no one year was less than 55 million sesterces' worth of Indian goods imported into the Empire (about £600,000), and that about 100 millions (£1,087,500) at the least annually left the Empire in exchange for Arabian, Chinese and Indian goods: 'our women and amours are very expensive!' But if this reflection implies that not all Asiatic oriental luxuries have been mentioned, but only those specially used for female adornment, this import would seem quite small, if entirely met with this outlay: the patriotic irritation at seeing so much money go annually into foreign, even hostile countries, would be quite justified. For there was no corresponding production of gold to the outflow, and the continuous export of centuries doubtless contributed to the decline in Roman money in the third century. True, thirty years ago, the export of metal to Asia, besides a considerable export of

goods, was on the average twelve times as much as in Pliny's time (£13,666,666.) According to Johann von Horneck, at the beginning of the eighteenth century, 'those bloodsuckers of Austria', woollen, linen and French wares, withdrew at least fifteen to twenty million florins annually (and silk goods seven million and French goods three million). By about 1750 France was selling Germany sixty-seven million livres' worth of silk and fineries alone; in 1853 her export to England in silk amounted to sixty-three million thalers, and five times as much to America, and twenty-one million thalers for Paris articles (bronzes, trinkets, clocks, fancy goods, passementerie work, marquetry, instruments, etc.).

Compared with modern commerce, the use of Asiatic *articles de luxe* in the entire Roman Empire seems astonishingly slight, even allowing for Pliny's statement of outlay being less than the reality, as the frontier customs increased the price, and the purchasing-value of money may have been higher. For the prices of single oriental products were very high, higher than now. Silk as late as 250 A.D. was weighed with gold (a fact mentioned in Chinese literature); a Roman pound of betel nut oil might cost 400 (£17 8s.), a pound of cinnamon, 1,500 *denarii* (£65 2s. 6d.); some pearls cost millions of sesterces. One shop in the Via Sacra or Forum Pacis might easily contain oriental imports of this value. And Roman prices were centuple, according to Pliny, of the cost price; and the frontier-tolls augmented considerably the cost of transport: on this higher estimate the whole import mentioned by Pliny must amount to 100 millions. If it cost no more, all the luxury in oriental wares must have been confined to Rome and a few great cities, a view confirmed by some remarks of Galen (*circa* 200). He says that silk could be found 'on rich ladies' at many places in the Empire, especially in the great cities, and specifies nard as one of the essences 'made for Rome's rich women'. In the fourth century wholly different commercial relations spread the use of silk amongst all classes.

But perhaps Pliny only wanted to state how much bullion was withdrawn from the Empire by trade with the East. For some Chinese statistics of the land of Ta-Tsin (Syria) seem to show that no small part of the import from Asia was covered by export from the West. The longest of these lists comprises sixty articles, characteristic industries of the mar-

kets of Syria, Phoenicia and Alexandria. To them belong the products of Ta-Tsin (according to a Chinese author, far better than Babylonian goods) with worked and embroidered animals, men, trees, clouds, etc., in different colours; glass-ware (especially coloured), which was popular in China down to the beginning of the fifth century, after which date the Chinese began to learn the craft from Syrians or Indians and to manufacture for themselves; all the metals found in the Roman Empire; gold pigment and realgar (specialities of Syria); jewellery (including corals and amber), of which the best were brought by merchants from Ta-Tsin, and, finally, drugs. The greater the export of these wares the higher must have been the value and quantity of the import into the Roman Empire. But as Galen's expressions imply a small trade, it may have developed after the beginning of the third century.

Extravagance in pearls and jewellery came into Rome after Pompey's triumph over Mithridates. Diamonds, though esteemed in Rome the most costly of jewels, were scarcely used as ornaments, except rarely in rings. The diamond handed to Trajan by Nerva as heir-designate, and by Trajan to Hadrian, was apparently not set in a ring: but one diamond-ring, the talk of Juvenal's time, was given to Berenice, Queen of the Jews and mistress of Titus, by her brother Agrippa. Emeralds ranked next. According to Pliny the best came from Scythia, as now, from the mines of the Ural and Altai. The third in order were beryls and opals, and were largely worn by women; and fourth, the sardonyx, which was very suitable for seal-rings: Pliny, on the authority of the ladies, maintains this hierarchy of stones. In their estimate of the diamond, the Romans imitated the Indians, whereas the Persians, in the thirteenth century, ranked it fifth, after the pearl, the ruby, the emerald, and the chrysolith. Benvenuto Cellini places it after the ruby and the emerald, and only worth an eighth of the ruby. Garcia de Orta (1565) declares the diamond the king of jewels for hardness, but the ruby first in value and beauty, and the emerald second. Up to the sixteenth century the emerald was very costly (Benvenuto Cellini makes it 400 *scudi d'oro* the carat): but it sank in price after the large Peruvian exports; and, with the complete cessation of these, has risen again: a perfect emerald is the most costly of all jewels in the London market.

Very little is known of the price of jewels in Roman antiquity. The emerald into which an amymone was cut, and which the flutist Ismenias bought for four gold pieces, must have been a chrysopras. Incised emeralds hardly occur before Hadrian's day: the best are said to have been portraits of himself and Sabina. Possibly Hadrian had a preference for this stone and thus caused it to be more eagerly sought in its principal home (Jebel Zaburah in Egypt). The price of a jasper-ring with which a statue of a woman in South Spain was decked by her son, is given as 7,000 sesterces; this implies a cut stone. The senator Struma Nonius owned a ring with an opal in it as big as a filbert; Antony proscribed him for it; he fled, taking with him the ring alone of all his possessions. It was apparently valued at 2 million sesterces (£21,250).

Pliny speaks at large and expertly on the imitation of jewels, and of manuals containing instructions for making false emeralds out of coloured crystal, and sardonyx out of carnelian; he says it is one of the most profitable of fraudulent industries. There was a correspondingly perfect science of testing the genuineness of jewels, in more than one way. Out of the very many ancient forgeries in coloured glass, the glass emerald stands out; it is much harder, brighter and better coloured than modern pastes, and is still often sold as genuine by jewellers. Besides, imitation jewels were no doubt often honestly made for sale among the poorer classes.

The worst and most censured extravagance was the ladies' love of pearls, which commanded higher prices than any other jewels. This use of pearls as ornaments spread after the conquest of Alexandria, which exported the fisheries in the Persian gulf and the Indian Ocean mainly to Rome. This incessant import may have accumulated pearls in Rome, as in Venice of the sixteenth century, when the Patrician ladies possessed vast hoards of them, the result of the past commerce with Ormuz on the Persian Gulf and all the other Eastern lands which Venice had so long exploited. The prohibitions of the *Provveditori delle Pompe* (sumptuary magistrates appointed in 1514) were aimed principally at this form of extravagance. At the present time Russia is the country richest in pearls: in the one monastery of Tróitsa, on priests' vestments, episcopal robes, altar and grave cloths, there are more than in all

the rest of Europe : in some governments every peasant wears on her head and neck 200 to 300, often 1,000 and more, genuine pearls ; in Nizhni Nóvgorod the poorest fishwife owns at least two or three necklaces. Nero even could build whole rooms of pearls for amorous dalliance (these were probably in the Golden House, and their walls covered with pearls). Roman ladies wore them as ear-rings ; and, according to Pliny, poor women copied the example, as a big pearl in one's ear was as good as a lictor to lead the way ; pearls were also used on shoes, not merely on the straps, but whole slippers were set with them. The cost must have been very great : Seneca may well be right in saying women sometimes carried two or three fortunes in their ears. There is no further information. Julius Caesar at his first consulate in 59 B.C., when pearls were rare at Rome, bought one for six million sesterces (£65,250) for Servilia, the mother of Marcus Brutus Servilia ; but a love-present from the first man in the State, desirous of creating an impression by his extravagance, is no criterion of the average price, any more than what Pliny tells of one of Caligula's wives, Lollia Paulina. He had seen her at a modest betrothal festivity, with an ornament of emeralds and pearls, covering head, hair, ears, neck and fingers, and worth forty million sesterces (£400,000 or £450,000), as she proved by documentary evidence. But it was not a gift from the Emperor, but an inheritance from the spoils of her grandfather Marcus Lollius in the East : Lollius' notoriety had brought him into disfavour with Gaius Caesar, who compelled him in 2 B.C. to poison himself.

The enormous hoards of jewels in the families of the men who could control the treasuries of Eastern despots, can only be compared with the jewellery owned by the Spanish *conquistadores* of the sixteenth and the English nabobs of the eighteenth century. Cortes' wedding-gift to his bride in 1529 consisted of five jewels cut by skilled Mexican jewellers out of emeralds, and artistically adorned with pearls and gold : for one of them a Genoese merchant at Seville had offered 40,000 ducats. It all was lost in a shipwreck on the expedition against Algiers in 1541. Nadir Shah's booty, on the capture of Delhi, consisted mainly of jewels, and was valued in Europe at £70,000,000. Clive, who rambled freely in the vaults of Mursahabad amid heaps of gold and jewels, with liberty to take what he would, showed great moderation : but his purchases

of diamonds at Madras alone amounted to £25,000, and a jewel-case belonging to his wife was valued at £200,000. Lady Clive probably owned more jewellery than the greatest princesses of her day. Sophia Charlotte at her coronation as Queen of Prussia in 1701 wore jewels worth over a million thalers. The famous necklace which cost Marie Antoinette so dear only cost 1,600,000 francs. In the modern Orient extravagance is still rife in pearls and jewellery, and was enormous under the Khalifs. In Persia, besides other ornaments, women wear bracelets on arms and feet of pearls, and noble ladies a diamond egrette as well ; sash-buckles set with jewels often are worth 1,000 to 2,000 ducats, and saddles and harness are laden with gold, pearls and jewels. Fifteen or sixteen rings, five or six on each finger are worn, and the Shah is the greatest owner of diamonds in the world.

In medieval Europe, pearls were used to embroider texts of songs on clothes, and there was great luxury in jewellery ; most of all at the Court of Charles the Bold of Burgundy. His robe of State was set with pearls and precious stones, and valued at 200,000 ducats ; his consort's ladies-in-waiting received 400,000 Brabant thalers a year for ornaments. But this extravagance increased after the discovery of America. Maria de' Medici at her son's baptism in 1606 had a bridal dress made, set with 3,200 pearls and 3,000 diamonds, and worth 60,000 *écus*, but too heavy to be ever worn. In the inventory of Meinhard von Schönberg (who died in 1625) the pearls alone filled two closely written folio pages ; fifteen large pearls were sold for 3,286 florins. Imitation pearls were first made by Jacquin at Paris in 1680 ; the annual export is now £40,000.

How far luxury in dress and ornament were prevalent among the lower classes in antiquity, how far the semi-civilized custom of the South obtained of carrying some of one's reserve property on one's back, is hardly known at all. But the long gold chains which the Roman barmaids wore on their bare necks must have been as genuine as the gold ornaments of women and girls of the lower classes in modern Italy. The amber necklaces which Pliny the Elder saw worn by Lombard peasants North of the Po, partly as amulets against swellings of the neck, can hardly have been costly.

Extravagance in scents has always been endemic in the East.

Arabia, as Herodotus knew, was the land most fertile in fragrances, and from the earliest ages a fondness for perfumes was general. In the Book of Esther, we read, 'When every maid's turn was come to go in to King Ahasuerus, after that she had been twelve months, according to the manner of the women (for so were the days of their purifications accomplished, to wit, six months with oil of myrrh, and six months with sweet odours, and with other things for the purifying of the womb)'. The Talmud says the bride may lawfully thus spend a tenth of her dowry. In Rome this form of luxury came in not direct from the East, but from Magna Graecia. Under the Empire, it was only common at Rome and in the larger cities. According to Pliny, a Roman lady so plentifully scented herself that attention was drawn to her approach, if for no other cause, for the fragrance that streamed from her hair and clothes. The same is true of Arabian ladies of rank. Pliny thought this extravagance all the sillier for being momentary, and, if anything, altruistic. Men, too, made much use of scents, mainly balsam and cinnamon. Domitian's favourite, Crispinus, smelt stronger in the morning than two funerals. So too at the Renaissance. Alfonso d'Avalos, the cousin of the Marquis di Pescara, could not do without scents, even in time of war; his horse's saddles even reeked of them. Mention has been made of the great cost of fragrances in ancient Rome. Martial is in doubt whether he shall give Phyllis 'ten yellow-boys from the imperial mint' (about £10 10s.) or one pound from the shops of Cosmos or Nicerus, the famous dealers in salves and essences. At these shops noble ladies' accounts may have been as high as that of Marion de Lormes, who owed her *parfumeur* £7,500 by the end of one year. The use of scents at funerals will be referred to later.

But Roman or modern luxury of this kind does not approach the oriental. In the apartments of rich Arabs at the time of the Khalifs, and on reception days especially, stood casks of strong musk or burning aloes. Even the most austere sticklers took care to follow the example of the Prophet, who only loved women and fragrances, and were always well perfumed. Before and after meals clothes were held over a censer, or the guests bent over it. Neither flowers with a strong smell nor perfumes might be absent from the table; they were worth their weight in gold and given as a costly gift. In rich homes there were

always in stock the principal varieties (such as ambergris, aloes, musk, camphor, amber, and mixtures such as civet). In the early Khalifate Irak and Persia commanded the market; and Persian rose-water was exported as far as China and Spain; later, as in all luxuries, Moorish Spain secured the field. To this day Arabian ladies spend £100 a year on perfumes.

The scanty and casual information extant on Roman luxury in dress prevents any final pronouncement. It does not authorize any assumption that ancient luxury exceeded modern, rather, on the other hand, that, as in all else, modern luxury is far greater.

IV. LUXURY IN DWELLING-HOUSES

(a) CITY PALACES

Luxurious inner fittings of houses first come into evidence in the interval between the first and second Punic wars, if not before; there were then houses decorated with 'citrus-wood, ivory and Punic floors'. But luxurious buildings only came in about 100 B.C., up to which date the houses of the nobles even were simple and inexpensive. Sulla (born in 138), as a young man, felt the pinch of circumstances, and lived in the ground floor (which was considered the best), for which he paid 3,000 sesterces (£26 5s.) rent; a freedman occupied the upper story at 2,000 a year (£17 8s.). Travertine stone came more and more into use for houses and frontages during this century, marble being almost unknown. Even in 92 B.C. after so many victories in Greece and the East, which abounded in marble columns, there were none in any Roman public building. Hence the Censor Lucius Crassus, one of the first men of the State, irritated public feeling by decking his house on the Palatine with four (or perhaps six or ten) columns of marble from Hymettus, which had been intended for the theatre built in his aedileship. His co-censor Gnaeus Domitius censured him sharply, and Marcus Brutus nicknamed him the Palatine Venus. Crassus' house was mainly valuable for a garden with six fine old lotus trees, worth 3 millions of the total 6 millions, i.e., more than £50,000, as money then stood; but the houses of Quintus Catulus (consul in 102 B.C. and conqueror of the Cimbri), on the Palatine, and of the knight and jurisconsult Gaius

Aquilius (on the Viminal) were far superior, Aquilius' being considered the finest in Rome. In 78 the house of the Consul Marcus Lepidus was deemed the finest; its threshold of *giallo antico* (a Numidian marble unknown before in Rome) caused much talk.

But thirty-five years later there were over a hundred finer houses in Rome. Pliny regards this marvellously rapid growth of splendour as doubly foolish, considering the shortness of life, and one of the wonders in the history of Rome. Wonderful rather was the long backwardness in this respect of the capital of the world; in other flourishing cities (see Macaulay on the progress of English towns since 1700) private magnificence came in more gradually: in Rome in one generation. Those thirty-five years from the consulate of Lepidus and the death of Sulla to the murder of Caesar (78-44) witnessed the largest acquisitions in East and West. It was the time of the wars of Quintus Metellus Creticus, Publius Servilius Isauricus, Pompey and Lucullus in the East, and Julius Caesar in Gaul: the Empire was enlarged by the provinces of Bithynia, Pontus, Crete, Cilicia and Syria. Generals, officers, officials, business men (e.g., Pompey's freedman Demetrius, who amassed 4,000 talents or £943,050) gained huge fortunes: partly spent on magnificent public buildings, even on temporary ones, such as Scaurus' gorgeous theatre in 58 B.C. But this magnificence also spread rapidly to private buildings. The largest of the 360 pillars, all 35 feet high, which had adorned his stage, Scaurus set up in the atrium of his house on the Palatine: they were of dark marble from Melos, first introduced by Lucullus and named after him. The first owner of a house (on Mount Caelius) consisting only of marble columns, and monoliths of green-veined *cipollino* from Carystus in Euboea, and marble from Carrara, was the Knight Mamurra of Formiae, Caesar's chief engineer in Gaul. As Pliny says, his house was a more eloquent satire on his shameless plunderings in Gaul than Catullus' verses. He was also the first who introduced Alexandrian incrustation. Sallust could tell of palaces laid out on the scale of towns. Together with the number of buildings the areal value and the rents rose (the ground of the forum built by Caesar in the busiest part cost 100 millions, £877,050) and, as compared with the other cities of Italy, four times as much. Caelius lived in a modest fashion (according to Cicero)

in a house owned by Clodius for 10,000 sesterces (£87 15s.) : his accusers alleged three times the rent, to convict him of extravagance and raise prices for Clodius. Cicero bought his house on the Palatine from Crassus for $3\frac{1}{2}$ millions (£30,696 15s.), and, on his return from exile, the Senate offered him 2 millions compensation for the ruined house ; the areal value may, therefore, be reckoned at $1\frac{1}{2}$ millions (43 per cent. of the whole sum).

The battle of Actium heralded another great building era at Rome, owing to the feeling of security after the general peace, the growing prosperity and population, the influx of capital, and also because of Augustus' strenuous endeavour to make Rome a worthy capital of the world, to turn a city of brick into a city of marble. The marble quarries of Carrara, which Vitruvius does not mention, were regularly exploited towards the end of Augustus' reign ; blocks of marble from there and other materials were landed at Ostia and floated up to Rome.

The poems of Horace, Tibullus and Propertius teem with the impressions of witnesses of this great luxury in building, and friends of the former simplicity. The 'novel' *atria* of great palaces were imposingly tall ; perhaps Scaurus' *atrium* was the first of them : it was 38 (Roman) feet high, whereas Crassus' *atrium* had been only twelve ; a standard of the difference between the palace and the citizen's home ; other dimensions must have correspondingly increased. In these *atria*, pillars of Phrygian marble (with spots of violet ; *pavonazetto*) aroused envy. Beams of white stone from Hymettus pressed down on columns of reddish-yellow marble with green veins, and of serpentine, quarried out in Numidia, Euboea or Taenarum. On gilded soffits (seen for the first time in the Temple of Capitoline Jupiter after the destruction of Carthage) ivory glittered. Between the gay columns in the yards stood bushes and groups of trees, fountains splashed, and purple awnings stretched from one capital to another shielded off the sun, and cast a red shimmer on the pavement or the moss. Under Sulla mosaic must have been very usual in Rome : Caesar took mosaics with him on campaign to spread in his tent. The directions of Vitruvius for the building of a great house correspond very well with the descriptions of Horace, Propertius, and Tibullus. Vitruvius says that for nobles royal lofty

vestibules, spacious *atria* and peristyles, parks and roomy, gorgeous avenues, libraries, picture galleries, *basilicae* must be laid out on the same scale as in public buildings. The palace of Augustus' friend, the Knight Vedius Pollio, covered 'inside its walls more space than many a town': its site was occupied afterwards by the Colonnade of Livia. And in smaller dwellings, e.g., at Pompeii, the number of apartments for separate purposes was considerable, though the rooms and the total area were small.

From Augustus to the death of Nero, extravagance in palaces tended to increase, as the great families vied in princely splendour; the economies of Vespasian's reign could not prevent monuments of gorgeousness arising equal to the old. Towards the close of Tiberius' reign, Valerius Maximus says that a palace with its appurtenances (i.e., garden), only four acres in extent, was considered small. This may seem exaggerated, but Velleius Paterculus is strictly accurate in saying a man living in a house under 6,000 sesterces a year (£66 15s.) is hardly recognized as a senator. This statement is a reminder not to dwell overmuch on the generality of rich homes, as in a modern capital no similarly highly-placed man would pay less than three or four times that sum. In 1462 Venetian nobles paid 50 to 120 ducats (600 to 1,440 francs); in 1658 the Venetian ambassador paid for his house at Paris 400 *doppie* (4,400 francs): in modern currency both amounts would be greater. The wife of the Russian ambassador at Vienna in 1852 paid about £450. Bismarck as Federal representative at Frankfort in 1851 paid the small sum (for Frankfort) of 4,500 florins, and at St. Petersburg for the furnished Hôtel Stenbock 7,000 roubles a year, and the Duke of Ossuna for his, 12,000. In 1863 there were in Paris 9,985 rate-payers, with houses from 4,000 to 8,000 francs a year; 1,413 houses cost 10,000 to 25,000 francs a year; and some 400 even more.

As both Seneca and Sallust say that city palaces were as large as towns or country estates, it is not known whether palaces increased in size after the time of Tiberius. These rhetorical exaggerations are at least to some extent justified by the architecture of large Roman houses. There was only one floor in the centre, and sometimes at the sides as well, and they occupied a comparatively large area with their gardens and parks and outhouses, such as Vitruvius mentions, foun-

tains, baths, colonnades and roads ; and with all the magnificence, accommodation may have been scant. Martial calls the Petilian Palace, where his patron Sparsus lived, a kingdom : it was a *rus in urbe* with long walks and a vintage as good as on a Falernian hill. In Violentilla's palace the gables rested on countless pillars, old groves cooled the air, living fountains played in marble basins, and it was cool in the dog days and mild in the winter.

What the price of such houses was at Rome, we do not know. Martial mentions a figure of 100,000 sesterces ; but only a small plain house could have been had at this price, and no fine house for double. For, according to Juvenal, a bath might cost 600,000, and a covered drive more ; these figures are not too high, perhaps too low, for Fronto (who was not a rich senator) spent 350,000 on a bath ; the description of the bath of Claudius Etruscus also bears this out.

But one form of luxury, unexampled in the history of architecture, was common, namely, decoration. The use of coloured marble for columns, and the ancient Asiatic fashion of covering the walls with bright sorts of stone and other costly materials, began under Augustus. Vitruvius knows nothing of this ; Seneca is the first to fulminate against the extravagance of 'walls glistening with large and expensive circular pieces of marble, with Alexandrian blocks contrasting with Numidian'. Besides this fashion of inlaying, under Claudius pieces were cut out of blocks, and the hollows filled in with other stones ; thus animals or other objects could be drawn ; in Pliny's phrase, 'they could paint in stone'. Two of these marble incrustations have been found on the Palatine. Under Nero, fancy marbles were produced by laying in bright veins and druses in tablets of other kinds of coloured stones.

But the wasteful use of valuable and rare kinds of coloured stone became very general during the first century. In one refectory built by Caligula's freedman Callistus, Pliny saw thirty columns of oriental alabaster ; four smaller columns of the same stone had been put up by Cornelius Balbus in his theatre under Augustus, as a curiosity. With the new countries gained, the Romans could exploit more quarries. Thus the ridges in the Arabian Desert of Egypt, at Jebel Duchan, yielded them porphyry, Jebel Fatiteh granite, Hamamet the Egyptian *breccia*, so much in favour at Rome, and Jebel

Urakan, the honey-coloured Oriental alabaster. But the two first quarries were only opened under Claudius, and, no doubt, many others in the course of the Empire, e.g., the Numidian under Marcus Aurelius. The extant remains imply more than forty sources of Roman luxurious architecture. In the splendid small bath built by Claudius Etruscus, according to Statius, the ordinary costly marbles were disdained, such as Thasian, Carystian, Ophite and onyx alabaster. Green Laconian Serpentine was only tolerated, in order to be a setting for inlaid blocks of white violet-spotted Synnadian *pavonazzetto* in long flutings; there was also a snow-white Phoenician marble, of which Pliny knows nothing. The arched roofs gleamed with gay pictures in glass mosaic; the water sprang up into silver basins through silver pipes; the bath was edged in with marble and the water flowed in so clear that the bottom could be seen; the room for playing at ball had its floor warmed from beneath. Other passages in Statius and Martial prove the generality of this luxury in coloured stones. According to Statius, Violentilla's palace gleamed with African, Phrygian and Laconian stone, onyx and marble, as bright as purple and the sea. According to Martial, a rich man builds *thermae* of Carystian, Synnadian, Numidian and Laconian marble. Hadrian's reign may have been the zenith of this extravagance, but the fashion lasted down to the end of the Empire; the villas and Domitian's palace will be described presently.

About thirty years ago the discovery of the ancient warehouse of marble at the harbour at the foot of the Aventine gave a new and surprising idea of the wealth in marble of Imperial Rome. About 1,000 blocks and columns, mainly of coloured species for architecture, were found there. The great fire of 64 A.D. may have been the occasion of this great accumulation, which was, however, only a part of the imperial stock, containing imports from Asia, Africa and Greece, and not all of these, and none from Egypt or Carrara. This store was used up to about 200 A.D.; what is left is what was not wanted for the buildings of the Flavian and Antonine periods. The scanty relics of the marble decorations of the imperial palaces, still give the spectator some idea of their magnificence. In the provinces, in addition to the native quarries, Carrara and Greek were also extensively drawn upon. The walls of Roman

villas near Zürich are still breast-high, covered with well-carved blocks of Jura marble, and the richer villas and the baths at Baden with Italian marble as well. In the garden of the archiepiscopal palace at Narbonne magnificent ruins, with marble from the Pyrenees, Africa, Carrara and Greece recall the whilom glory of Narbo, the city of Mars; and at Vienne there also are considerable remains of various foreign marbles.

The use of glass for decorative purposes was also carried to excess quite early. Seneca speaks of arched roofs hidden by plate-glass. The foundations of Rome are sown with panes of glass and relics of floor and wall decorations, artistic and carved. At Veii a floor of compact glass of the size of the room was found. Glass cut like cameo in two colours (like the Portland Vase) is still to be seen in the ruins of the walls it once adorned. There are also fragments of real painting on glass. Pliny mentions as a new invention the use of glass mosaics to decorate ceilings; and also speaks of walls covered with plates of gold; a form of luxury that reached its height in Nero's Golden House. In the seventeenth century (according to Vacca) a room was found on the Aventine, the walls of which were hidden behind gilded bronze tiles with incrustated medallions, and (on the authority of Bartoldi) on the Palatine a room incrustated with plates of silver, in which still more costly ornamentations must once have been set. Other inventions of gorgeousness in architecture must date from Nero's reign, such as movable soffits, especially in banqueting-rooms, which changed for every course. Sometimes, to point the contrast, these same palaces would contain so-called 'poor apartments', artificially simple.

Yet all this splendour was nothing in comparison with the fairy splendour of the palaces of Caligula and Nero, which, according to Pliny, 'embraced the whole city'. Of Caligula's little is known. Nero's Golden House, recommenced after the fire of 64 A.D., covered 50 hectares: the Romans were invited in a satire to remove to Veii anew, as Rome was all filled up, before it extended to Veii as well. It lay on the Velia, the Esquiline and the valleys in between; on the Esquiline it adjoined the imperial gardens of Maecenas, and was cut through by several streets. In the forecourt stood a colossal statue of Nero more than 100 feet high. The palace contained triple colonnades a Roman mile long; a pond, 'as

big as a sea' (on which the Flavian Amphitheatre was afterwards built), surrounded with buildings like a town; country seats with vineyards, meadows and woods, stocked with beasts, tame and wild. The apartments were gilded over, and decorated with jewels and mother-of-pearl; the 'love-chambers' were decked with pearls. The finest sculptures from Greece and Asia Minor were used to decorate. Of the artists employed in the work Pliny mentions a painter Fabullus, who was famous for his bright colours. Remains of painted walls, hidden below the *thermae* of Titus and Trajan, are in a style like the last Pompeian, but better and more sustained, as well as in the framed pictures and decorations, which inspired the grotesques of Raphael and Giovanni da' Udine. New discoveries and inventions were applied; a temple to Fortuna was built of a stone found in Cappadocia, so transparent that it was light with the doors shut. The ivory tiles on the ceilings of the banqueting-rooms could be shifted, so as to shower down flowers on the guests, or scents from pipes. The main banqueting-room was domed and turned day and night round its axis. The baths contained both sea and mineral waters. When the palace was habitable, Nero, on entering, expressed his satisfaction, and said he could now live like a man. Otho granted 50 millions (about £550,000) towards completing it. Vitellius thought what was as yet built unworthy of an emperor; but Vespasian had the greater part demolished and replaced by public pleasure resorts. The amphitheatre supplanted the pond, and Titus' *thermae* were built on the Esquiline. The Colossus of Nero Vespasian transformed into that of a Sun-god: the pedestal is still extant.

Of the later Emperors, Domitian distinguished himself by his palaces. Plutarch says that in Domitian's Temple of Capitoline Jove (the fourth) the gilding cost over 12,000 talents (£2,750,000); but any one who had seen a single colonnade, basilica, bath, or mistress-room in the palace, would be bound to call Domitian a Midas whose touch turned everything into gold. The ceiling of the banqueting-hall, of enormous span, with a huge opening to let in the light, rested, according to Statius' panegyric, on few columns, but those strong enough to support the heavens. Numidian, Synnadian, Chian, Carystian marble vied together and granite from Syene; only the pedestals were of Carrara marble; and the height was

such that the weary eye could hardly reach up to the gilded soffits.

(b) VILLAS AND GARDENS

§ I

In the City herself building was restricted by the small area and the high price of ground ; but on their huge estates the grandees' passion for building could be indulged without limitation. The unhealthiness of Rome in the summer and early autumn made country-life a delight and a necessity ; and large properties gave, even in the later Republic, a choice of pleasant residences. The increase of villas made the price of suitable sites rise. Lucullus paid for Marius' villa at Misenum 2,500,000 *denarii* : it had been bought by Cornelia, the mother of the Gracchi, for 75,000 : the enhancement of the price must have been due to improvements.

After the battle of Actium the building-fever gained ground all over Italy. Soon, thought Horace, will the princely demesnes leave but little land for the plough ; everywhere artificial lakes, larger than the Lucrine Lake, will extend, and the plane supplant the elm with its graftings of vines ; in the stead of fertile olives, there will be shady myrtle and laurel groves and fragrant violet-beds, and in the place of natural turf colonnades to ward off the sun and north wind. Further, senators by a series of *senatus consulta* and imperial decrees were frequently compelled to invest in Italian land ; the number of villas consequently increased. In the heat of the summer they might repair to their homes in the Sabine or Alban hills for fresh air ; in the spring or late autumn to the soothing warmth of Southern Italy ; or they might enjoy the beautiful splendour of the Gulf of Naples, or forget the bustle of Rome in the retirement of the plane-groves of Upper Italy. Everywhere, country houses or palaces were ready to receive them. Pliny the Younger, who was not very rich, owned properties in Etruria (near Tifernum Tiberinum), near Comum, Beneventum, villas on Lake Como, and an estate near Laurentum. His contemporary, the famous orator Regulus, who was worth over 60 million sesterces (£650,000), owned properties in Umbria, Etruria, near Tusculum and in the Campagna near the road to Tibur.

The luxury of villas was often heightened by difficulties of building. Sallust speaks of the wealth squandered on houses jutting into the sea, or on mountain plateaus. Statius says of the villa of Pollius Felix near Surrentum that Nature had been made subservient to man. 'Where you now see a plain, there was a hill; where you go under cover, was a wilderness; where you see lofty trees, there was no soil: here the stones obey, the palace advances, and the mountain retreats'. Sea-rocks were grown with vines for the Nereids to pluck at night-time. In the villa on the Lago di Fusaro, in which Servilius Vatia, a rich man of Praetorian rank, vegetated away his last days, there were two artificial caves, hollowed out with great labour, as large as the largest *atria*, the one never seen by the sun, the other in sunshine all day long. A canal from the sea to the lake of Acheron passes through an avenue of planes: here they fished, when the sea was too rough. The villa had all the amenities and none of the disadvantages of Baiae.

The predilection for the sea, and the desire of enjoying it close at hand produced many expensive water-palaces, the walls of which, as Ovid says, thrust back the blue waves. Horace also repeatedly speaks of the quarry-stone rocks in the sea. 'On any little bay', says Seneca, 'you lay your foundation and create fresh soil'. The remains of the palaces of the sea near Antium and elsewhere can still be seen in the water. There were also similar buildings on the provincial coasts. On the estates of the rich sophist Damianus of Ephesos on the sea, there were artificial islands and dams, where merchantmen could anchor. His town houses were partly like city residences and partly in grottoes, and all his country estates teemed with shady fruit trees.

There are almost contemporary accounts of villas gorgeous and modest from Pliny the Younger and Statius. Pliny's Laurentine and Tuscan villas were on healthy and beautiful sites, the one on the sea, the other in the valley of the Tiber on a slope of the Apennines, with apartments suitable for every season, and wonderful and various views from all the windows. The furnishing was comfortable and bright, without extravagance. Except for four small columns of Carystian marble, which supported a vine in the Tuscan villa, there was only white marble (and that only in small quantities), or the walls were

decorated with simple paintings; in the Laurentine villa the openings in two covered walks were closed with isinglass-stone, and there was no fountain (in the Tuscan villa there were several). The gardens had only the usual plants and trees, which would grow well, violets, box, rosemary, vines, mulberries, figs in the one, and, in the other, roses, acanthus, box, vines, laurels, planes (some overgrown with ivy) and cypresses.

One of the two villas described by Statius was built for Pollius Felix, a rich man of Puteoli, on the Punta della Calcarella between Capes Massa and Sorrento and has been mentioned to exemplify the great outlay on the foundations. The outbuildings and gardens appertaining comprised the whole coast from Marina di Puolo and the East side of Capo di Sorrento. On the shore there was a warm bath with two cupolas, temples of Neptune and of Hercules; a colonnade went along a sinuous path up to the villa. The rooms had a varied outlook on the sea and the islands. The most prominent part was a wing or hall, whence the Gulf of Naples could be seen; it was decked with bright marble from the best quarries of Greece, Asia Minor, Numidia and Egypt. Everywhere valuable pictures and sculptures of the old masters were to be seen, and portraits of philosophers, poets and generals. A few relics, such as bright marble pavements and columns, have occasionally been recovered on the coast and at Marina di Puolo.

In the estate of Manilius Vopiscus near Tibur, there were two palaces opposite each other on the two banks of the Anio, at a point where it flowed peacefully (above and below were waterfalls): the distance was so short that one could talk and almost shake hands across the stream. A dense lofty wood converged to the bank and the beshadowed water reflected the leaves. It was cool in the dog days and the July sun could not penetrate the apartments. These gleamed with gilded beams, doorposts of yellow marble, wainscotings with designs in inlaid coloured veins, costly mosaics, numerous *chef-d'œuvres* in bronze, ivory, gold and jewels by famous masters; every room had its own water-supply, and its own outlook, on ancient parks or the river; it was all peace; the bubbling stream lulled to rest. There was a warm bath on the bank. In the centre of one of the palaces stood a fine tree overtopping the

roof. An orchard, grander, according to the poet, than the gardens of Alcinous and Circe lay near the villa. Niebuhr credits the poems of Statius with reproducing the true local colouring, and being popular in Italy: they are good to read in those parts and recall the bygone splendour, formerly combined with the charm of an opulent Nature, which made the rich and great enviable.

This is perhaps most of all felt in wandering through the green wilderness of ruins that was once Hadrian's Tiburtine villa. The total surface area was about two-thirds of a square kilometer, four times as large as the Palatine. There were two palaces and other buildings, named after famous spots which Hadrian had visited. There was a Lyceum, an Academy, a *poekilē Stoa*, a *prytaneum*, a Canopus and a Tempe, and a Hades. This reminiscent nomenclature may have been common in the well-travelled aristocracy: on a property of Severus, who was especially interested in Egypt, there was a Memphis, and, on another estate, a Labyrinth. Galen tells of a rich man who transported to Italy enough Dead Sea water for a small pond. Of the villas of the later time that of the Gordians on the Praenestine Road deserves mention. It comprised a square *Tetrastylum* with 200 pillars of the same height, fifty of *giallo antico*, of *cipollino*, *pavonazzetto* and red porphyry respectively; basilicas 300 feet long, *thermae* only equalled by those at Rome, and all else on the same scale. Provincial villas will be dealt with later.

A comparison of Roman luxury in palaces, villas, parks and gardens with modern times is doubly difficult, because ancient taste had a different source and direction, and many detailed descriptions would be requisite. Only a few examples from various epochs and countries of magnificence in buildings can be given here.

Venetian palaces as early as about 1500 were the most gorgeous of Italian Renaissance buildings. In a room twelve yards long, in which a great lady in the family way received visits, the mere fixtures cost 2,000 ducats (24,000 francs). About 1600 Venice contained a hundred palaces, some costing at the outset over 200,000 ducats.

Jacques Cœur's house in his native city Bourges (built in 1450, and still standing) was adjudged by a contemporary superior to any royal palace: before completion it cost 100,000

écus (8 to 10 million francs) : the exterior and interior were covered with artistic sculptures, the rooms with costly tapestry and gold and silver. Amongst other magnificent private houses of the Renaissance in France (mostly destroyed at the Revolution) Château Gaillon was famous; it was built by Georges d'Amboise, minister of Louis XII and archbishop of Rouen. Richelieu spent 10 millions on his castle, 'the most splendid in France before Versailles was built'. The castle and gardens at Vaux belonging to Foucquet, the minister of Louis XIV (who fell in 1661) cost 18 million livres, and was valued by Voltaire at double. The huge gardens occupied the area of three villages which Foucquet bought up. They were partly designed by Le Nôtre, and considered the most beautiful in Europe : the fountains were then thought marvellous, and the royal castles of St. Germain and Fontainebleau were not comparable with Vaux. The leaden waterpipes were afterwards sold for nearly half a million. About 1750 English gardens were made near Paris and ran away with vast sums. Hence they were called *folies* : the *folie Brumoy* ruined the Marquis de Brumoy, a tenfold millionaire. The great tax-farmer and banker Joseph de la Borde bought his *folie Méréville* for 30 millions : he had constructed in Beauce an Alpine country with waterfalls and pine-woods, a devil's bridge over an abyss, and beyond the bridge a marble Temple of Friendship.

The French country-seats of the eighteenth century were the models for the rest of Europe. At Rosswalde, near Hotzenplotz in Moravia, Count Hoditz spent 3,000,000 florins on a fairyland. Pulavy, the residence of Adam Czartoryski, was a little Versailles inside vast gardens. The immense castle of Felix Potocki at Tulczyn cost many millions, and was more like a royal palace. At the same expense, and employing 10,000 labourers, Potocki in the last ten years of his life (1795-1805) built his Sophia the castle Sofiyovska, 'an enchanted world sprung from nothing'.

Of the nineteenth century country-seats Count Pückler has described those of the English aristocracy. Woburn Abbey, belonging to the Duke of Bedford 'with its stables, riding-ground, galleries of statuary and paintings, hot-houses and gardens is a little town, a self-complete example of tasteful luxury', such as only centuries of thought could produce.

Amongst the various gardens are a huge plantation of azaleas and rhododendra ; a Chinese garden with a dairy, built like a Chinese temple, with an excess of white marble and bright glass, and a fountain in the middle. The aviary consists of a large fenced-in space and lofty plantations and a cottage, with a small pond in the centre : the countless birds (partly rare and foreign) live in oak-branches wired together, with a wire roof, and evergreens all round. The park is sixteen miles round, and Ashridge Park, the seat of the Duke of Bridgewater, twelve ; in the latter there are a thousand sorts of wild animals and countless groups of giant-trees ; the pleasure ground and the gardens are larger than in Cassiobury Park (the seat of the Earl of Essex), the upkeep of which costs £10,000 a year. Warwick Castle, which was partly burnt down on December 3, 1871, was a 'fairyland'. The rows of reception-rooms on both sides of the hall were 340 feet long. Walls 8-14 feet thick formed in every window (10-12 feet wide) a regular room, with splendid views. The English aristocracy, too, own many more country seats than the Roman grandees used to have ; in 1848 it is said one peer offered a French friend a castle of his as a refuge, which he had never seen : it was said to be very beautiful ; in expectation of his arrival the table was laid every day with twelve covers and a carriage was always kept ready.

In 1860 Paxton designed a château at Ferrières, of more than princely magnificence, for Baron Alphonse Rothschild ; ' Too great for the middle-class ', said King William, who saw it in 1870. The hall looked fairy-like with its galleries all round covered with splendid carpets, and, with its 1,110 gas-jets, according to Drumont, was alone worth the journey thither. The tasteless accumulations in the inner apartments of the artistic masterpieces of all times is only ' the brutal triumph of wealth ' and produces wearisomeness rather than admiration. In the Park the conservatories and aviaries are very attractive. One of the most splendid Russian castles is the palatial villa at Archangel, near Moscow, in Italian style, which Prince Yusupov bought from Prince Michael Galitsin for 6 million roubles. It stands in a broad park, with fine views on meadows and woods, has a great gallery of valuable pictures, a splendid chapel, a concert hall, a theatre seating 500, many reception-rooms with costly vases, etc. A palace at Alupka, an estate

in the Crimea belonging to Prince Woronzov, was said to have already cost 7 million roubles, and was not nearly finished when Haxthausen saw it in 1843-4. Count de Vogüé in 1886 describes it as finer than the largest palaces of the Sultan on either side of the Bosphorus 'in certain points, its situation and its gardens. Only a Russian of the first half of the nineteenth century could have designed this oriental wonderland. In Russia one loves the impossible and soon tires of it'. The lofty Moorish halls and labyrinthine walks of the Park of Alupka are a wilderness. While the gorgeous English castles were the work of centuries, the Roman palaces of the empire were quite recent, only dating back to the last century B.C. But perhaps building extravagance has never been so great as from the reign of Augustus up to Vespasian. Circumstances combined to make it unparalleled. The deep Roman love of the colossal, developed by the world-dominion, could only be satisfied by the 'massive and roomy', in both private and public buildings. The desire of representing Rome's dignity suitably, the pride of impossible obstacles surmounted, the habit fostered by slavery of realizing the moment's whim, all these were tendencies which culminated in the autocracy, but were common to all the rich and great, who regarded themselves as the lords of the earth. Julius Caesar, when poor and in debt, had a villa, recently built at great expense, pulled down, since it did not reach his expectations. Cassius Dio tells of one Sextus Marius, who, as a friend of Tiberius, attained great wealth and power, and entertained a neighbour, against whom he had a grudge, for two whole days; during this time he had the latter's villa pulled down, and rebuilt more gorgeously, to make him dread him as a foe, but value him as a friend. Horace says, if a rich man admire the coast of Baiae, the lake and the sea at once feel the passion of the impatient architect: a new whim to-morrow, and the labourers must remove to Teanum. Strabo remarks that the ceaseless sales of houses at Rome furnished constant occasions for alteration and rebuilding. Naturally this essentially noble passion drove many into debt or bankruptcy. A valuable house, says Plutarch, makes many a man a borrower. Cetrionius, says Juvenal, had the building mania, and was always erecting on the winding shores of Gaeta, the heights of Tivoli, or the hills of Palestrina, lofty villas, with marbles from Greece or distant lands, which put the Temples

of Hercules or Fortuna to shame. Thus he somewhat impoverished himself, but his son built yet costlier villas of rarer marbles and completely ruined himself. Little men also vied with the great: Horace and Martial apply to them the fable of the frog. Martial tells of a *vici magister* (district-superintendent), who competed with a consul. The consul possessed a palace four miles from the city, the other bought a plot of land at the same distance; the consul built elegant *thermae* of coloured marble, the other a bath no bigger than a kettle; the consul had a laurel plantation on his estate, the other planted a hundred chestnuts.

Such a characteristic waste of costly, coloured marbles was only possible in the capital of a world-empire, which could import by sea pillars, beams and blocks from the numerous quarries in the Mediterranean countries, which have since relapsed into a barbaric condition. But Macaulay, on visiting the Vatican Museum in 1838 could still rightly wonder that 'in our moneyed and luxurious age no one attempted to open quarries like those which supplied the ancients. The wealth of modern Europe is far greater than that of the Roman Empire; and these things are highly valued and bought at enormous prices. And yet we content ourselves with digging for them in the ruins of this old city and its suburbs, and never think of seeking them in the rocks from which the Romans extracted them'. His expectation that the French settlements in Africa, and the rule of a Bavarian prince in Greece would induce such undertakings, has only to a slight extent been fulfilled. The quarries of Numidian marble at Shimtu (Simitthu) have been reopened after a thousand years, and the blocks cut by Roman chisels are being sawn by steam-saws.

Thus Roman palaces may have been more gorgeous than English or other modern ones, but the gardens and parks were very inferior and smaller in area. Whether the Roman grandees had as much space to dispose of as the British is doubtful. According to John Bright, in 1866 half of England belonged to 150 persons, and all of Scotland to ten or twelve; the Duke of Sutherland, the greatest real owner, possessing 482,676 hectares, and the Marquis of Breadalbane being able to ride ninety miles straight through his own domain. But Roman taste delighted in artificial gardens and scenery, rather than landscape, and was not enamoured of parks; nothing was known of hot-

houses and the reproduction of the vegetation of foreign zones and climates.

And in Roman gardens, unlike the variety of the decoration of the walls, there was lacking the brightness of the modern flora. Roman luxury in flowers consisted in the extravagant use of a small variety, especially lilies, roses and violets. This was excessive and unexampled ; at a feast given by one of Nero's friends the roses cost over 4,000,000 sesterces (£43,500), and we are told of the beds and tables of Aelius Verus, consisting entirely of roses and lilies. In Varro's days, nursery gardens of roses and violets near Rome paid well, and flower beds surrounded the city, extending even as far as Campania and Paestum. Under Nero, winter-roses were in demand : they were partly shipped from Egypt, partly, like lilies, cultivated under glass. In the winter of 89-90 the number of Paestum roses in Rome was so great that all the streets were red with the cheap wreaths. Egypt, says Martial, instead of exporting us such, might have imported.

Modern Europe owes much of its splendid garden flora to the Turkish love of flowers. Stamboul originated the tulip, the fragrant syringa, the oriental hyacinth, the crown-imperial, the garden *ranunculus*, and spread them *viâ* Vienna and Venice into the West, as well as the chestnut, common laurel, and the mimosa or *acacia Farnesiana*. Carnations, at the Renaissance, spread from Italy across the Alps. America brought many new varieties, the wild vine, the Peruvian capuchin-cress, the lombard or pyramidal poplar, the American plane, the North American acacia, the *Bignonia Catalpa*, tulip-tree, and South of the Alps, the magnolia and pepper-tree, etc. The Opuntian cactus and the aloe 'have completed the type of Mediterranean landscape, which derived its severe calm colour from the East, with an entirely harmonious addition'.

The great increase of artificial cross-breeding has produced a form of luxury, utterly unknown to antiquity ; and the prices paid by amateurs for rare flowers in modern times (e.g., 70,000 francs in 1838 for a bed of dahlias, £100 in 1839 for another variety in England) are only comparable to the prices paid in antiquity for rareties and amateurs' delights. Of the *Araucaria* at the Villa Pallavicini at Pegli in 1865 every species was valued at 10,000 francs, some at 30,000. James Veitch & Sons specialize in orchids and carnivorous plants, and in 1879

sent out six gardeners to the Tropics, Asia, the jungles, the swamps and woods and the heights of the Himalayas to search for new species.

V. LUXURY IN DOMESTIC ARRANGEMENTS

Domestic luxury in antiquity (and in some respects to this day in the South of Europe) was intermediate between our Northern standard and that of the East. It aimed not at 'comfort' (for which the Southern languages have no word), but at parading the owner's dignity as much as possible. The dwelling-rooms were but little used by day, and sparsely furnished according to our ideas; but the lofty and large reception-rooms, intended for the crowds of morning visitors and evening banqueters, contained relatively few articles, but very costly and mainly decorative, e.g., tables of citrus wood with ivory legs, sofas inlaid with tortoise-shell or ornamented with gold and silver, Babylonian carpets, splendid vases of Corinthian bronze and *murra*, Aeginetan candelabra, sideboards with old silver, statues and paintings by famous artists.

Of several articles of luxurious furniture, the prices are extant; they are always very high, and sometimes enormous. Aeginetan candelabra were bought at 25,000 sesterces, or even twice that sum. *Murra* was a material the ancients did not understand, coming from the East, as valuable as gold, and first introduced by Pompey after the conquest of Mithridates: it was probably some form of agate; *murra* vases worth 300,000 (£3,262 10s.) were in private hands. Nero had a drinking-cup made which cost a million. Comparable is the price given for porcelain in the eighteenth century: Count Brühl owned a service worth a million thalers. In Paris 20,000 *livres* for a service of Saxon porcelain was a large sum, yet there are some vases now which are worth £750. Many Romans also had a mania for rock-crystals; Pliny says 'some years ago, a lady of moderate means bought a rock-crystal wine scoop for 150,000 sesterces' (£1,631 8s.). Under Nero two small artistic goblets of novel workmanship were sold at 6,000 (£65 5s.). The passion for wrought silver dates back to 200 B.C. Lucius Crassus the orator (consul in 95) possessed dishes

worth 6,000 sesterces a pound, the craftsmanship costing twenty times as much as the material; in Martial's time 5,000 a pound was considered a large sum. But the work, genuine or spurious, of famous artists sold for much more. Babylonian embroidered coverlets for sofas in the banquetting-hall sold in the second century B.C. at 800,000 sesterces (then worth £7,016 8s.); Nero had some worth four millions (£43,500). But the worst was the 'mania' for citrus-wood tables, which furnished women with a retort, when reproached by men for their love of pearls. Beautifully grained boards of *citrus* (a kind of thuja growing on the Atlas) fetched fabulous prices, as the trunks were seldom thick enough to make table-tops, though there were some with a diameter of four feet. Cicero bought a table of citrus-wood, which existed in Pliny's time, for 500,000 sesterces (then worth £4,385 5s.), a price Pliny thinks extraordinary at an epoch so comparatively simple and poor. Later on there were even more expensive ones, e.g., for 1,400,000 (£15,226 10s.): Seneca is said to have had 500 tables of citrus-wood.

All these prices are extraordinary, and, as such, recorded; the standard of comparison must be similar luxuries of later times. Evidence that the average price of luxurious furniture was much lower is afforded in a poem of Martial's, describing a snob who exaggerates the quality and cost of all he has. He buys slaves for 200,000 sesterces, drinks old vintages, has plate worth 5,000 sesterces a pound, a gilded coach worth as much as an estate, a mule bought for the price of a house, and all his not very large possessions cost a million. This sum must have been sufficient to furnish a fine house, if not a palace.

Pliny's prices are exceptional fancy prices, such as amateurs or madmen (as Pliny says) will give. Of such fashionable perversions Pliny instances Annius the Consular, who collected *murra* ware with such enthusiasm that, having bought a cup (containing 3 *sextarii*) for 700,000 (£7,612 10s.), he gnawed its rim so as to increase its value. Similarly in modern times rareties have fetched enormous prices 'through the insanity of a few' (as Seneca says of the Corinthian bronzes) from connoisseurs, the English especially: e.g., £600 for a *heller* of Emperor Henry VII, £2,260 (in 1812) for a decameron; in ancient times such prices were paid for historical curiosities, e.g., the lamp of Epictetus (3,000

drachmae: £117 16s.), the stick of Peregrinus Proteus for a talent (£235 15s.). But the fancy prices then paid have apparently never since been attained ; this highest form of extravagance in these objects, as in some others, has remained unique.

With regard to luxury in household furniture, the greater costliness of the fewer *objets de luxe* in the Roman palaces is fully balanced by greater multiplicity and variety in the modern, especially as the cost was, and still is in some cases, enormous.

At the Renaissance in Italy rooms were expensively and artistically decorated. There were richly ornamented ceilings, marble fireplaces, carpets of gilded leather, or silk and velvet, with gold and silver designs, tapestries, pictures in costly frames, magnificent carved wood furniture, heavy curtains, oriental embroideries, vessels of gilded or enamelled silver, crystal, Murano glass, and majolica, figures and articles of bronze and ivory, etc. In Venetian palaces in which internal luxury and art reached their height in the sixteenth century, the palace of Vendramin Calergi was noted for its use of valuable marbles and stones in chimney-pieces and columns, and for the ebony and ivory on the doors. In the 'Golden Room' of the Cornaro house there was a splendid chimney-piece with golden caryatides, tapestries of gold, and the gilding on the beams was valued at 18,000 *zechini*. In Wolsey's palace all the eight ante-rooms to his Audience-hall were hung with costly tapestries, which were changed every week.

In France towards the end of the reign of Louis XIV expensive furniture came in mainly through the rich business men, who filled their rooms with tapestries from Beauvais and gobelins, Boulle, Chinese and Japanese furniture, Venetian and Nüremberg mirrors, pictures by French and foreign masters, silver plate and valuable porcelain. This luxury, which increased during the Regency of Louis XV, combined comfort and good taste to the satisfaction of the utmost indulgence. In the *boudoir* of a house fitted up with most refined extravagance (1758), the walls were all covered with mirrors. Trees realistically grouped together and covered with foliage, were decorated with porcelain flowers and gilded chandeliers, which held rose and blue candles ; the soft light was delicately reflected by the mirrors, some of which were shaded with gauze. Scents had been mingled with the paint on the wainscoting; thus the artificial thicket smelled of violets, jasmine and roses.

Such boudoirs were no doubt numerous at that time in Paris. Under Louis XVI extravagance in cut and gilded bronze made it almost as valuable as gold. The carving on one pedestal by the famous Gouthières was valued by the artist at 50,000 *livres* and the Comtesse du Barry owed him 756,000 *livres* at her death. In opulent houses the mere construction was only a quarter of the expense: 'all the splendour of the nation was to be seen inside'. In Beaumarchais' palace, famous for its architecture and gardens, the gorgeous show-rooms were real art galleries; his richly painted desk cost 30,000 francs. In 1796 Bonaparte had to spend on his wife's small palace, which was worth 40,000 francs, 120,000-130,000 for the furnishing. From France this passion spread. The Elector of Bavaria, Max Emanuel II (about 1700) paid 60,000-100,000 thalers for a chimney-piece and two rococo tables from Paris; the furniture in Countess Kosel's pleasure palace of Pillnitz cost 200,000 thalers.

The last decades of the nineteenth century have seen a great increase of luxury: at the Paris Exhibitions bookcases worth 25,000 francs, desks worth 10,000-15,000, were seen, and at the Berlin Industrial Exhibition of 1879 furnished rooms costing 4,000-14,000 francs. Count Pückler illustrates the splendour of English castles. The furniture of Northumberland House is worth several hundred thousands. Warwick Castle is 'a realm of past centuries', everything being 'old, splendid and original'. One could see 'the rarest and richest articles such as modern craft cannot make, and gold, silver, velvet and silk all together. The furniture consists almost entirely of ancient and splendid gilding, carved dark walnut and oak, or old French cupboards with bronze ornaments. Magnificent mosaics and inlaid wood may be seen. The art treasures were countless; the pictures nearly all by the greatest masters'. These descriptions of English castles prove that the connoisseurs of the Roman Empire never realized the reproduction of definite historical styles, by imitation or collection.

§ 2

Silver-plate, as a form of luxury, requires special mention. Tiberius forbade the use of golden plate by private individuals, except at sacrifices; Aurelian repealed the law. But Tiberius' edict was disregarded: we hear of golden plate

being used almost as often as in modern times. Great extravagance prevailed in silver plate, as well as in wrought silver articles, valuable chiefly for their antiquity and their workmanship (*caelatura*). In the Early Republic silver plate was so rare at Rome that the Carthaginian envoys found the same service at every house they dined at; conquest made it more common. The conquests of Spain (the Peru of the ancient world) in 206 brought the Cartagena silver mines under Rome's domain. According to Polybius, about 40,000 men worked there, and a net profit of 25,000 drachmae (£975) a day was obtained. Syria, Macedonia, Carthage, Corinth, Asia, Provence, and the Mithridatic campaigns supplied Rome with precious metals in abundance. The discovery of America increased the bullion of Europe from £34,000,000 to £130,000,000 by 1700, and £297,000,000 by 1800; on the smaller area of the Roman Empire this smaller importation of the precious metals operated similarly. Some few facts may illustrate the luxury in gold and silver in modern Europe.

In the fifteenth century it was already considerable. True, in Florence families lent one another their wrought silver, and brass or silver knives and forks were ordinarily used. But some individuals possessed large masses of silver and gold, e.g., Cardinal Pietro Riario in 1473 was host to the bride of the Duke of Ferrara at his palace in Rome; he exhibited four church candlesticks and two angels in gold, a praying stool with lion-shaped feet of gilded silver, a silver set of fire-irons, a silver close stool with a golden chamber, and a fresh service of silver plate for every course; in the banqueting hall was a buffet of twelve tiers full of golden and silver dishes set with jewels. In France, under Louis XII, architectural gilding and gilded silver came in; lords and prelates had plates of gilded silver or pure gold. In Germany, whose miners made her the fifteenth century Peru, Aeneas Silvius was astounded at the universal extravagance in gold and silver, and especially in armour and decorations. According to Wimpheling the rich merchants ate off dishes of silver and gold, and, on their journeys, had such dishes (weighing 30, 50, or 150 pounds) sent after them.

In the sixteenth century Guicciardini mentions the massive silver of the Flemish burgesses, and Holinshed is grieved at the introduction of silver spoons into England. Cardinal Wolsey's silver was valued at 150,000 ducats. In the seven-

teenth century under Charles II of Spain (1665-1700), in spite of the want of ready money, the quantity of silver plate was enormous. At the death of the Duke of Albuquerque, the weighing and cataloguing of his silver and gold plate took six weeks; there were 1,400 dozen plates, 500 large and 700 small dishes, 40 silver ladders (which were used in the silver cupboards). The Duke of Alba, who thought himself poor in silver ware, had 600 dozen plates and 800 silver dishes. All this came from Mexico and Peru. In England the fashion also spread. Civil and military uniforms were embroidered in gold and silver; nobles and rich citizens had mirrors and pictures in silver frames, and tables of silver plate. In France many noble families had silver worth 400,000-500,000 francs, which was valued all the more for being hidden and turning black. In 1689, Louis XIV, to meet the expenses of the war against the Great Alliance, ordered the conversion into coin of all the nobles' plates, and deprived himself of all his tables, *canapés*, candelabra, and massive silver furniture (made by the goldsmith Balin from the designs of Le Brun); they had cost ten millions and brought in three. The private contributions came to three millions. In 1711 fresh meltings down brought in another three millions; but much was hidden on both occasions. In Law's time (1710-20) the extravagance revived; twenty to twenty-five millions of gold and silver passed through the smiths' hands. A painter, a mad squanderer, possessed a princely table-service, besides little tables, mirrors, orange dishes, flower pots, cooking utensils, all of massive silver. Water jugs, snuffers, salt cellars, were also often made of silver. In England under Queen Anne this manufacture received a fresh impulse, aided by the new fashion of tea drinking. From 1765-1780, tea-urns, tureens, tea and coffee pots, salvers and wine coolers in silver were much used; silver plates, dish covers, and watches were used even among the lower classes, and the gilding of rooms used up much of the gold. 'Many an Amsterdam merchant in 1792 displayed more heavy metal than a prince; at the Hague gardens had massive silver gates'. Professor Gottfried Sell married a rich Dutch woman, and in his lecture-room at Göttingen had silver spittoons and candelabra. The jewellery of Count Wartenberg was taxed at his death in 1711 and valued at 100,598 thalers, his plate and furniture at 18,896.

In Russia and Poland, in the nobles' houses in the eighteenth century, in white-washed rooms, with rough woodwork and bad furniture, great masses of gold and silver might be seen. Prince Vasili Vasilyevich Golitzin (1643-1714) had 400 silver dishes, and Prince Alexander Danilovich Menshikóv (died in 1729) 72 dozen silver plates and 105 pud (1686 kilogrammes) of golden table services. Count Peter Borisovich Sheremetyev (son of Boris Petróvich, who was ennobled by Peter the Great) at his estate, Kuskovo, near Moscow, gave banquets for 2,000, sixty of whom were served on plates of gold. Charles Radziwill at Nieswiesz had 1,000 golden and silver rareties, tables of wrought silver, and statues of the twelve Apostles, each two feet high, of pure gold.

From 1800-1830 there were in England 10,000 families, each owning valuables in gold and silver up to £500, and 150,000 owning up to £100 worth; the poorest had ear-rings, spoons and small articles. In 1855, according to M. Chevalier, France spent 60,000,000 francs worth of gold and silver, besides the money in circulation, and in 1880 over 70,000,000. England consumes as much; here the use of gold for ornament and other purposes has in the last ten years almost doubled, while that of silver has remained stationary.

Our scanty information scarcely affords a just means of comparing Roman extravagance in silver with that of modern times. Before the wars of Sulla there were in Rome more than 100 dishes weighing 100 pounds each (33 kilogrammes) which cost many of their owners their heads in the proscriptions; Rotundus, a slave of Claudius, and *dispensator* in Lower Spain, had a silver dish weighing 500 pounds, and his followers some weighing 250; this may indicate a fashionable luxury of the time, as in Paris in the thirteenth century, when the rooms were sparsely furnished and lavish use was made of dishes of gold, silver, crystal, set with jewels or enamelled, 'in the manufacture of which medieval art was unrivalled'. 'Capital was invested in gold and jewels and the grandees of France hoarded masses of gold, which recalled the wealth of the East'.

Perhaps the Romans and the thirteenth century Parisians in accumulating silver were simply laying by capital in a form permanently valuable and easily negotiable. Thus the peasants of Sweden in the sixteenth century put their extra money into heavy clumsy silver spoons, weighing 3-4 *reichsthaler*;

poor peasants who had not a bed saved some up, and the rich had as many as fifty or half a ton even. Similarly, in the delta of the Vistula, in 1800 and later, rich farmers hoarded silver spittoons and chambers as well as tea and coffee pots and urns, silver carriage ornaments and harness. In 1720, when Law's bubble was bursting, in Paris gold and silver was being used in the stead of copper and tin in the commonest articles; and this was due not merely to extravagance, but to the fall in the shares. The modern Russian and Polish Jews buy jewellery and gold articles beyond their means and out of proportion to the rest of their property; Jewish walnut-hawkers buy silver candlesticks at Königsberg 'to have articles for pledge'. As in the modern East, where 'all wealth must be readily transportable in exile', at Rome jewels were mostly accumulated in the Eastern provinces; in one of Christ's parables a merchant puts all his fortune into a single pearl. There may have been reason enough to be prepared for anything: thus Galba in Nero's reign never ventured out without a carriage with a million sesterces in gold behind him. And when after Nero the coinage was depreciated, the custom of putting by a reserve fund of silver probably spread. For the *denarius* of almost pure silver was alloyed, under Nero, 5-10 per cent., under Trajan, 15 per cent., under Hadrian, nearly 20 per cent., under Marcus Aurelius 25 per cent., under Commodus 30 per cent., and under Septimius Severus 50-60 per cent. Although the coin lessened in value, its mint rate remained the same. As early as 100 A.D. payment in gold was exacted.

Hence the custom came in of engraving the exact weight on the articles for the purpose of inventories, when the amount was always stated, and the custom of giving away silver plate at feasts. At the *Saturnalia* poor or mean persons gave little silver spoons, rich or generous persons dishes and cups of silver, or even gold. Martial complains at the *diminuendo* series of a friend's *Saturnalia* gifts; ten years ago he gave silver weighing four pounds, five years ago a little plate of two-thirds of a pound, the sixth year a little dish about half a pound, and in the seventh and eighth spoons as big as a medler. Juvenal makes a glutton pay for his expensive tastes by pawning silver vessels and breaking a medallion of his mother. St. Ambrose makes a usurer tell a borrower: 'in order to find you the money, I will break up some silver heirlooms; their workmanship is

highly artistic and I shall lose considerably, since no interest can replace the embossed figures ; but, for a friend's sake I will not fear the loss, which I will make up when you repay me '.

How great in the Early Empire this lavish use of silver was, may be seen from the statement in Pliny, that Pompeius Paullinus (Seneca's father-in-law), General of the Army in Lower Germany in 58 A.D., carried 12,000 pounds of silver (4,000 kilogrammes) about with him. Much of the silver table plate belonging to the officers, merchants and officials there must have fallen into the hands of the Germans. In 1868 a hoard of ten silver dishes was found, weighing over a hundredweight. Of course, Paullinus' hoard was exceptional. Alexander Severus, who was one of the most economical emperors, had no gold plate even at banquets, and only 200 pounds (65·5 kilogrammes) of silver. But many private sideboards may have been more grandiose.

Pliny's remaining facts are of little use : they are too exaggerated, e.g., he says women will only bathe in silver baths. But they confirm the view that silver was used even in the middle and the lower classes. Soldiers had silver sword-hilts and belts, silver chains on the scabbards ; and poor women wore silver anklets, and even slaves had silver mirrors. At Pompeii, after the eruption, the inhabitants carried away all the valuables they could ; but even so, up to 1837 over 100 silver dishes have been found ; in 1894 a villa of a Pompeian near Bosco Reale was excavated and over 97 silver articles found, 90 being for the table. In the provinces, too, especially Gaul and Spain, many silver articles have been found, at Bernay in Normandy 69 articles in raised work were discovered.

VI. LUXURY IN FUNERALS

Ancient Roman expenditure on funerals was altogether far greater than modern. The love of display and the tendency to make extravagance the measure of grief, the conception of the duties of the living towards the dead, the idea of their immortality, and the desire to keep the memory of them alive, contributed to increase this expenditure enormously. Even the Twelve Tables legislate against wanton expenditure, and

decree that no gold is to be buried, except that which fastens the teeth—a proof of the antiquity of dentistry in Rome.

Every full funeral cost a considerable sum for the procession, which was preceded by flutists and blowers of horns and *tubae*, as well as choruses of dancers and dramatic mimes, who also sometimes represented the deceased. The most sumptuous obsequies were those of the nobility, a regular feature of which was a procession of the ancestors, whose parts were taken by persons as like them as possible, mostly by actors. These carried with them the century-old pictures of the ancestry from the *atria* of great houses, i.e., had masks on, made as faithful as possible, and appeared in the most dignified robes to which the ancestor was entitled; curule magistrates in the purple-hemmed *toga*, censors in the purple *toga*, and *triumphatores* in gold-embroidered purple, and they had lictors with the *fascēs* walking in advance and all the usual attributes of office. The carriages and hearses of these forbears often numbered several hundreds. In 22 B.C. at the funeral of Junia Tertulla, the sister of Marcus Brutus, and wife of Gaius Cassius, 'the images of twenty of the most illustrious families preceded her hearse, the Manlii, Quinctii, and other equally ancient families, and, above all, Brutus and Cassius were conspicuous—for their absence'. At the funeral of Drusus in 21 B.C., the son of Tiberius, there was a similar gorgeous ancestral procession. There were seen Aeneas as the founder of the Julian gens, all the Kings of Alba, Romulus and the Sabine nobles, Attus Clausus, the founder of the Claudii, and an endless succession of other distinguished Claudii. The requisites for these processions may have belonged to the families, but the cost must have been very heavy.

Next, fine scents were lavishly squandered in the procession and at the pyre or grave, and were sent as condolence gifts by friends. Incense 'which was dedicated to the gods in single grains, was offered to the dead in heaps'. For example, at Ostia twenty (Roman) pounds (6.55 kilogrammes) were consumed, at the expense of the commune, at the funeral of a youth of the rank of a *decurio*, and at that of a lady of the city aristocracy fifty pounds (16.37 kilogrammes). Pliny calculated the three commercial kinds of incense at 6, 5 and 3 *denarii* to the (Roman) pound. Other fragrances, even more costly, were only rarely used outside Rome, where the waste

of the dearest perfumes of India and Arabia was enormous. According to Juvenal, Crispinus, the favourite of Domitian, smelt of *amomum* in the morning as strongly as two funerals. At the obsequies of Sulla the Roman ladies, it is said, contributed so much spices and perfumes that two huge figures of Sulla and a lictor could be made out of 'dear incense and cinnamon'; both formed part of the ancestral procession of 210 carriages. At Poppaea's funeral in 65 A.D. her body was embalmed in Eastern fashion and laid in the Mausoleum of Augustus, and Nero, according to the experts, burnt more than a year's crop of Arabian incense. At the funeral of Annia Priscilla, the wife of Flavius Abascantus, the freedman and secretary of Domitian in 95 A.D., her body was mummified, laid in a marble sarcophagus and, according to a poetical description, the harvests of Arabia, Cilicia, the Sabaei and Indians, saffron and myrrh, and Jericho balsam filled the air with their perfumes.

The pyre, too, no doubt was a work of luxury. Certainly, we only know of those of the emperors, which in the third century consisted of several pyramidal tiers, covered everywhere with gold-braided carpets, pictures and reliefs, all abandoned to the flames. But as Pliny speaks of painted pyres, it is probable that private individuals imitated this extravagance according to their means.

So, too, the workmanship and material of the cinerary urns and sarcophagi containing the body were often costly. Urns were seldom made of gold or silver (though Trajan's, in the pedestal of his Column, was of gold), but rare and costly stones were frequently used. The ashes of Philetus, a slave of Flavius Ursus (about 90 A.D.) were extinguished in Setina wine, and his remains enclosed in an urn of oriental alabaster. In a *columbarium* of imperial freedmen and slaves of the first two centuries, there are several carved marble urns and one of oriental alabaster, that of an imperial slave, Africanus, who according to the inscription had made for himself a 'little chapel with a grating and golden ornaments'. A glass urn found at Pompeii with white figures in relief on a dark blue background representing genii gathering grapes, is one of the most beautiful specimens of the glass-work of antiquity. The sarcophagus of Nero, which was buried by his former love Acte, and his two nurses Ecloge and Alexandria, was of

Egyptian porphyry, with an altar on it of Carrara marble, and an edging of white Thasian marble. It is well known how richly and artistically sarcophagi and urns were decorated.

A third cause of extravagance was the custom of burying or burning with the body things used by the deceased in life, e.g., clothes, weapons, ornaments, tools, playthings, etc. The idea of corporeal immortality, and the desire of giving expression to intense sorrow explain the custom. Lucian makes a widower say that he has proved his love of his wife by burning all her clothes and ornaments at her funeral. Regulus the orator made an ostentatious exhibition of his grief at the death of a son about 14 or 15 years old, and had all the boy's many ponies, dogs, nightingales, parrots, and blackbirds slaughtered at the pyre. Before being committed to the flames or the grave the bodies of the dead were dressed in the most magnificent attire. Even such a stoic as Cato of Utica showed how grief overwhelmed him at the death of his beloved half-brother, Quintus Servilius Caepio, at Aenus in Thrace 'by the costly funeral and the burning of expensive robes and fragrances'. The heirs of Gaius Cestius (a contemporary of Augustus) who was buried in the well-known pyramid at Rome, were directed by his will to bury with him the gold-embroidered carpets of Attalus: the aediles intervened, they were sold and the proceeds devoted to the building of the pyramid. The sumptuary laws were as little enforced, in general, by the aediles during the Empire, as at any other time. Nero was buried in the white, gold-embroidered carpets he had used at his reception on his last New Year's Day, and Annia Priscilla in Tyrian purple.

We possess but scanty records of the expense of great or small funerals. The *Curia* (common council) of Pompeii granted at the death of an aedile the ground and 2,000 sesterces (£21 15s.) for the obsequies, 2,000 and an equestrian statue for a *duumvir* (the highest official): this then sufficed for an honourable funeral. A veteran at Lambessa left by his will only 2,000 sesterces for his funeral: the heirs added 500. For the funeral of a Surrentine who had held the highest offices and priesthoods in his native city, the city council granted the ground, two statues and 5,000 sesterces (£54 6s.). The Roman scale was naturally much higher. One Caecilius Claudius Isidorus in his will of January 27, 8 B.C., stated that, despite great losses,

he left 4,117 slaves, 3,600 yoke of oxen, 257,000 head of other cattle, and 60 millions (over £650,000) in money; for his funeral he assigned 1,100,000 sesterces (£12,000). Pliny records this sum for its exorbitance, for Nero's obsequies only cost 200,000 (£2,175). At Vespasian's funeral, the actor who represented the parsimonious monarch, asked how much the procession and obsequies cost; the procurators replied, 10 million sesterces; he rejoined they might give him 100,000, and throw him into the Tiber. However great may have been the pomp of imperial funerals, probably a fabulous sum was introduced in this instance for comic effect.

Yet the custom of inviting the whole community to banquets, shows and gladiatorial combats at the burial or later celebrations in memory of the deceased was the cause of far greater expense. Many instances are known from Republican times. They were often testamentary directions. According to Horace, one Staberius in his will directed his heirs to inscribe the amount of his estate on his tombstone, or, in default, to give a gladiatorial combat of 100 pairs and a public meal with Arrius, a well-known wastrel, as organizer. In Republican times, too, this custom obtained in the Italian towns. Thus a *duumvir* at Sinuessa, on his father's death, at the funeral distributed honey-wine and pastry, and gave gladiatorial games for the district, and a feast to the citizens and his own family. Most probably this practice was continued under the Empire. Pliny the Younger praises a friend for promising Verona gladiatorial games as an acknowledgment of his own great repute, and a debt due to the memory of his wife, a lady of Verona. It was true, he had been importuned and could not refuse, yet his generosity and lavishness was very praiseworthy and the proof of a great mind. At these games panthers were imported from Africa. Under Tiberius the mob in an Italian town stopped the funeral procession of an officer in the market-place, until the heir had promised gladiatorial games. Or, instead of banquets, largesse might be distributed. At Gabii a silk merchant, at the dedication of his daughter's memorial temple in 163 gave the *honoratiores* of the first class 5 *denarii* each, those of the second class 2 each, the shopkeepers inside the walls 1 each, and paid 100,000 sesterces into the city account, the interest on which was to be spent on every anniversary on a public

banquet to the *honoratiores* of the two first classes. Many similar records of endowments in annual memory of the dead are extant.

Finally, the splendour of the monuments, the richness of their decoration within and without was very great, even having regard to the unique luxury in art of this time, and it was heightened by other causes: sumptuary laws were practically ineffective. The desire, amounting to a passion, of immortalizing one's self and one's kin, would be, it was thought, best secured by buildings, whose ornamented and architectural piles should tower up for all eternity, to the astonishment of later generations. Thus the cult of the dead demanded suitable accommodation for the sacrifices at the grave, and the erection of monuments in the form of temples or similar buildings in two storeys. Lastly, the idea of corporeal immortality led to the erection of 'eternal habitations' in the form of dwellings, with gardens around, and furnished like houses within.

There were few general God's acres, and those who could not build graves on their own lands had to acquire pieces of ground, generally by the high roads. There numerous family graves as a rule were intended for the purchaser, his descendants and family, and also for his freed slaves and their descendants. In a gift of a burial ground to the city of Sassina in Umbria one hundred square feet was allowed for every single grave, which was quite large enough for a family; the grave of a freedman of Trajan, who was director of the Imperial Post at Rome, was only $10\frac{1}{2}$ feet square. But even in the time of the fire larger spaces were usual. The grave of Numerius Istacidius at Pompeii is 15 feet by 15. Geminus Eutyches, a nursery gardener at Rome, wanted to make his 20 by 20. Spaces 25 by 25, 25 by 30, and 26 by 35 (the two latter at Ostia) were plainly quite common. Some even covered an acre (28,000 square feet) or more. Trimalchio designs a burial ground of 20,000 square feet, on which there are to be a monument, vines, an orchard, and a caretaker's lodge. In one passage, 10,000 sesterces is said to be the price of a burial ground.

These splendid mausoleums lined the roads leading into Rome and the other Italian cities, and towered above the smaller ones; only a few are left, e.g., the monumental towers

of Caecilia Metella and of Plautius, on the Tibur road, the *torre d' Orlando* (the monument of Munatius Plancus) near Gaeta and the pyramid of Cestius. Most of them have utterly vanished, save for a few stones; Martial's prediction has come true, that his poems would be still read, when fig-trees were growing in the marble tombs of Licinus and Messalla, and these monuments were dust. In the smaller towns of Italy the extravagance was proportionately great, e.g., the remains of a once stately monument of Mamia at Pompeii, in the form of a temple with pillars, on a raised foundation. In 169 the silk merchant of Gabii erected his daughter's tomb; according to the inscription, a temple with a bronze statue of her as Venus and four other statues in niches, with bronze doors, a bronze altar and so forth.

In the provinces also there were great monuments. The mausoleum of a rich man at Langres (of the Early Empire) contained (according to his will) two statues of him, both sitting, of the best Greek marble and best bronze of the second kind. In front of the building there stood an altar 'of best Carraran marble and the best workmanship', to contain his ashes. On the grounds adjoining were a pond and an orchard, to be kept by a gardener with three assistants. Arrangements were, as usual, made for keeping the whole in good repair.

Some Roman monuments in the Provinces have survived. At Igel near Trèves there is a monument of the Secundinii, 73 feet high, of hard grey sandstone, richly carved and decorated, formerly in colour; it is one of a style much fancied in the district of the Meuse and the Moselle. There are fragments of other similar monuments, from Luxemburg and from Arlon, and many from the excavations of Neumagen since 1877-8. They were obelisks, at least 9 feet high, carved with portraits of the deceased and pictures in relief of their past lives, in colour and very realistic. The *Aiguille de Vienne*, the so-called grave of Pilate, is a 'lofty pyramid based on a Janus arch, of huge stones, quite undecorated'. The tall Roman mausoleum of the Julii at St. Rémy near Tarascon is 17.90 metres high altogether, and was built about the end of the Republic by three sons for their parents. A quadrangular sub-structure, mounting by steps, with painted reliefs of the deeds and prowess of the father, supports a quadrangular Corinthian arcade, open on all sides, on which there was built an open round

temple of ten Corinthian columns with a conical cupola, containing the statues of the parents. The so-called towers of the Scipios near Tarragona, a large isolated monument, date from about the reign of Augustus. Near the East Jordan there are still a large number of the square towers, so much used in Roman monuments, which also served as dove-cots. The monument of Titus Flavius Maximus, the praefect of the third legion, which was stationed at Lambessa, is a square stone building, standing on a socle and crowned with a pyramid, and was 19-22 feet high; in 1849 it was thrown down by an earthquake, but restored by the French garrison. The ashes were in a leaden urn, which crumbled on being touched; they were wrapped in zinc and reinterred, and a whole battalion fired a salvo to pay the last respects to the *manes* of the Roman officer. In 1894 the mausoleum of Apuleius Maximus of El Amruni was discovered far south of the Salt Lakes; it is decorated with a picture of the parting of Orpheus and Eurydice. In 1850, Heinrich Barth, travelling inland from Tripoli towards Mursuk, lighted upon numerous Roman remains, some of them still very grand, which in former centuries had been worshipped by the Berbers. At the Northernmost edge of the Hammada (31° - 30° N. Lat.) he found two monuments, 48 and 25 feet high, which 'rose like lonesome light-houses of power and civilization from the lofty sea-like plain', and both were in an excellent state of preservation. The style of both was the same: a foundation with steps, containing the grave, and on it two square storeys, with Corinthian columns at the corners, and richly decorated and carved with portraits of the deceased, and, on the top, a pyramid. The Southernmost of these monuments (a square, one-storeyed building on Corinthian pillars with a moulding at the top, and three steps) at Old Djerma (Garama 26° $22'$ N. Lat.) proves that the Romans held long sway over the Tripoli deserts.

The cost of the monuments, which were often directed by will (and the heirs often contributed in addition) is given exactly in several inscriptions. The amounts vary from 200-100,000 sesterces (£21 15s.-£1,037 10s.). The monument of a Decurio of Roman Augsburg, who died and was buried at Epfach, cost 6,000 (£65 10s); and Flavius Maximus' monument at Lambessa twice that sum. But the prices we know of are almost all those for soldiers and subordinate officers

(legionary tribunes at the highest) in Algeria, and for *honoratiores* of the Italian and provincial cities. The great men of Rome paid on a far larger scale: the monument of Thasian marble Cato of Utica had built for his half-brother at Aenus in Thrace cost about £1,900, and under the Empire this amount must have seemed ordinary. A monument erected by his comrades to a Praetorian out of his own money (at the earliest under Septimius Severus) cost 200,000 (£2,175).

The most gorgeous mausoleum in all Roman history was that of Hadrian; it may have surpassed all others, as did his villa, but still serves to illustrate the magnificence of these buildings. Hadrian began it six years before his death; it was completed by Antoninus Pius in 139. It is comparable with the Pyramids, from which perhaps certain details were borrowed. The substructure, now destroyed, of Parian marble blocks uncemented was loftier than the city wall; according to Procopius each side was 104 metres long. The cylindrical centre erection, 73 metres in diameter and in height (the Castel Sant' Angelo), only gives an idea of the colossal dimensions of the whole; of the architectural features, and upper decorations, little is known. A colossal statue of Hadrian, perhaps in a chariot with four horses, surmounted the Mausoleum, in which all the emperors and members of the imperial house, from Hadrian to Commodus (excepting Didius Julianus) were buried. The splendid carvings of 'men and horses' (probably all colossal) were either on the platform of the substructure, or, according to recent conjecture, above the top moulding of the cylindrical erection. By 537 the Mausoleum had been stripped of its carved decorations. The Romans hurled the statues down on to the heads of the Goths who were besieging Rome under Witichis. One is yet extant, though mutilated: the so-called Sleeping Faun of the Barberinis, which was discovered when the ground round the Castel Sant' Angelo was excavated, and is now in the Munich Glyptothek. Down to 1379, when the Romans destroyed it, the monument remained in good preservation.

VII. LUXURY IN SLAVES

The conquests of Carthage and Corinth, which brought great wealth and crowds of prisoners to Rome, mark the

beginning of the great and extravagant trade in slaves. The great increase in the number of slaves necessarily led to extravagance ; and the sale of the remainders of the slave families, who multiplied the more, the more numerous they became, and the profits from the work of industrial slaves, who cost little to buy or to feed, afforded ample means for satisfying such luxury. Slave-labour was far more profitable than in modern times, since slaves carried on all kinds of business and trades in their master's service, or on his account, or were let out to others for similar work ; thus most of what is in modern Europe done by free agents was slave-labour in ancient Rome. Only slavery could have rendered possible the extravagance in art, which to us is inconceivable.

Extravagance in slaves took two main directions : the maintenance of useless slaves for mere luxury—for the cheapest goods are most squandered—and the waste of their labour in an absurdly minute subdivision of labour. In this respect great Roman households resembled those of any country in which labour is almost valueless, e.g., early Russia. About 1800, some palaces in Moscow employed over a thousand servants, some of whom had only to carry the drinking water at midday, or at evening. In Bucharest in 1866, out of 100,000 inhabitants, 30,000 were domestic servants, and every house teemed with them. Every servant had his own narrow sphere ; every *boyar* family its contingents of washerwomen, bleachers, ironers, bathwomen, hair-curlers, chambermaids and nurses, lackeys, cooks, scullions, messengers, coachmen, grooms, huntsmen, etc. In the inscriptions of the common burial places of the slaves and freedmen of great Roman emperors we find torch-bearers, lantern-bearers, chief sedan-chair carriers, street attendants, keepers of the outdoor garments ; this sample of one department implies the scale of the whole. Further, much labour was also wasted through the lack of machinery. Thus slaves had to serve as clocks and announce the hours. As an indication of the slaves kept by the rich, the vocalist Tigellius may be taken, who, under Augustus, oscillated from wealth to poverty, having sometimes 200 slaves, sometimes twenty. In 61 A.D. the city praefect Pedanius Secundus, the principal man in Rome, had 400 in his palace.

Further, slaves were used to save every personal exertion,

mental or physical. 'Use your slaves like the limbs of your body, each for its own end', said Democritus; but 'the Roman house was a machine, in which even the mental powers of the slaves and freedmen yielded their produce to the master; a master who knew how to govern these, had countless minds in one'. There were secretaries and shorthand writers to take down from dictation, slaves to read aloud, 'study slaves' who read up, carried out researches and prepared their master's work. There is evidence of this only for the emperors, but the great value laid on a literary training justifies the assumption that this department was usual in great houses. This is the only explanation of Pliny the Elder's literary activity, considering how many public offices he held; the multitudinous facts for his *Natural History* must, at least, have been worked up by slaves and freedmen. Quintilian says that Seneca was mostly misinformed by those who undertook research work for him, who must have been slaves or freedmen.

The desire of doing as little as possible oneself, of not even thinking for oneself, was sometimes exaggerated. The names of clients and dependants were left to the *nomenclatores* ('we remember by means of others', says Pliny), and some had slaves to remind them when to go to bed, or to table. 'They are', says Seneca, 'too weary to be able to know if they are hungry'. One of these weaklings, after he had been lifted out of his bath, and deposited in an armchair, asked, 'Am I sitting down?' A century later Lucian, with disgust and astonishment, says that fashionable Romans had slaves to inform them in the streets of any obstacles or unevenness, ascent or descent: 'They have to be reminded that they are walking, and behave like the blind'. Any who approached had to be content with a silent look, and being greeted by an attendant. Thus even culture was acquired through the slaves. Seneca tells of a rich man, Calvisius Sabinus, whom he still knew, who wanted to appear learned, though uneducated and without any memory. He made one slave learn all Homer by heart, and another all Hesiod, and others the nine lyric poets; these slaves stood behind him at banquets and prompted his *à propos* quotations. Each slave cost him 100,000 sesterces: 'as many cases of books', said one of his parasites, 'would have cost less'. The same jester summoned him

to wrestle, although he was extremely weak. 'How can I? I am hardly alive!' 'What! Don't forget you have many gigantic slaves!'

Slaves who were really luxuries were exhibited mostly at banquets; they did not serve, but stood there to delight the eye and afford entertainment. They were marshalled by colour, race and age; none might be unlike by reason of more down on the chin, curlier hair or finer locks. Pretty boys, 'the flower of Asia Minor', might cost 100,000 or 200,000 sesterces, and served as cupbearers. The guests liked drying their hands in their hair. Alexandrian boys were imported for their ready and biting humour; they were trained in spiteful repartee, and were allowed to direct their precociously obscene gibes against their master and his guests. Ladies let little children play round about them naked, and enjoyed their innocent chatter. But also, as at the Courts of previous centuries, dwarfs, giants, giantesses, 'real' *crétins*, hermaphrodites, and other freaks were kept and exhibited; there was even a 'market of natural freaks' at Rome, at which 'men without shanks, with short arms, three eyes, pointed heads', might be bought; dwarfs were artificially produced, and many grotesque bronzes are extant with the most various mutilations and crippings, and attesting the extent of this horrid affectation.

VIII. CONCLUSION

The revolting feature of Roman luxury in slaves is not so much the extravagance, as the contemptuous disregard of human dignity; an aspect not of Roman luxury, but a result of slavery. Excepting this form of luxury, which the modern world fortunately cannot parallel to any extent, our comparisons show that the modern scale of expenditure is generally higher than the ancient; this is natural, considering that the requisite conditions were then by far less common.

It must not be forgotten how small, and how much poorer, the ancient world was compared with ours; and that the earth gave man much more meagre returns. The Roman Empire comprised not quite two-thirds of Europe, and little of the rest of the globe was accessible. The East and the barbarian countries yielded the Empire but little of their valuable pro-

ducts. In many provinces civilization was only beginning ; and even those most highly developed stood far behind those of modern days in productive power. The exploitation of Nature and her artificial culture was, despite considerable progress, comparatively slight. Many inventions and sources of enjoyment remained undiscovered. International traffic—despite the wonderful and admirable efforts of the Romans—was nothing like that of modern times ; commerce and industry were in some respects in their infancy. Excepting such products as Nature herself lavished, the making of the same commodities required far greater effort than now.

This relative smallness and poverty of the Roman world made the standard of comparison for many things much smaller than ours ; what was huge to them is not huge to us. Rome even, the giant city and world capital, was never as large as modern Paris, and always far smaller than modern London and, at her greatest, never had a third of the population of the latter. But the luxury of Rome appeared to contemporaries greater than it would to us, because of this different standard and the greater naturalness of Roman life, and also because the highest grade of luxury was apparently far more confined to Rome, than it is now to our greatest and richest cities. The more unique Rome then was, the more vast and portentous she seemed. Höck is right in saying that ‘ ancient luxury was far more limited than modern both with regard to its social *milieu* and its articles of consumption, and cannot be compared with that of our days, when the poorest hut has a store of foreign foods and clothes, which are regarded as necessities ’.

This chapter will have shown that Roman luxury was not as extravagant as it might seem from the words of the ancients themselves, and that Roscher’s statement, that imperial Rome was the greatest example of the senseless and immoral luxury of a decadent nation, must be modified. This view is the less tenable, since many of the features which Roscher deems typical of healthy luxury in flourishing nations existed at Rome. Such are the return to Nature, luxury found in conjunction with economy, a high degree of cleanliness, and the love of free Nature. The absorption of the whole life and all classes by luxury of this kind is shown in the fact that certain more refined, but by no means indispensable, articles were in general use among the people. Such luxury is only

possible, where social conditions are not too strikingly unequal. In the periods of highest civilization, state luxury is manifested in objects, which can be enjoyed by all.

Our scanty authorities for the Early Empire leave some doubts as to what extent these objects of civilization were then existent. Clothing was more natural, and much more alike in all ranks—a great difference from modern times, despite our advance upon previous centuries. But in ancient Rome there was no need to return to Nature, for even in the time of decadence ancient life was far more natural than modern, and the Empire only inherited Republican traditions which continued to exercise a certain influence during its first centuries. It was a question of maintaining a condition of things, which modernity has only reached in a roundabout way. The same garb, within the reach of poor and rich alike, the *toga*, was the ceremonial dress of the emperor or the poorest plebeian. This persistent idea of equality may have rendered futile the attempt of Alexander Severus to devise robes of dignity for the various officials. A carriage aristocracy may have arisen after the third century; up to then there was no riding, much less driving, allowed in ancient cities. An ordinance of Caesar's obliged all Roman towns to provide pavements; the obligation was carried out: 'in this respect, as in all matters of roads, modernity follows in the footsteps of the Romans'. Roscher also regards the supersession of French gardens by English as a sign of a return to Nature; but the Augustan fashion of trimmed hedges and architectural garden arrangements is a proof, not of luxury but of the feeling for Nature characteristic of the Southerner.

How far Roman luxury was combined with economy can only be partially determined. In Rome, there was much 'gilded poverty' and specious splendour, and probably a large industry in cheap substitutes for valuables; thus the fashion of costly tables in the Early Empire soon led to the invention of veneer. Most of all were cheap substitutes used in the decorations of private houses and public buildings, as is shown in the case of a middle-sized town like Pompeii; here we find stucco, clay, terra-cotta, gypsum, and glass for marble and ivory, bronze for gold and silver, paint for coloured stones, copies for originals, and an appearance of bright splendour at small outlay. This noble side of luxury, this craving for art

was universal in a sense we do not realize now, and will be more fully dealt with in a special section.

The most developed luxury of all was that of cleanliness. The many and often imposing remains of aqueducts in the cities of the Empire are a standing reproach to the tardy recognition of this great need by the modern world. The universality and excellence of them can be only indicated here by special instances. 'Pompeii abounded in water; in all but the smallest houses it was supplied, even in excess; there were sixteen jets in the House of the Vettii, and the public baths absorbed large quantities'. In many other cities of Italy great rows of arches, or inscriptions (specifying emperors, patrons, magistrates, individuals and communes as the builders), and pipes with city stamps attest the presence of a water-service, e.g., at Trieste, Bevagna, Circello, Pozzuoli, Canosa di Puglia, etc., and the water not wanted for civic purposes was sold to profit the city purse. These city revenues 'were augmented by rich householders, who had a service installed, and land-owners who watered their fields, as far as they might, from the Aqueduct, and by the artisans, especially the fullers, who needed water in their work; some also laid out baths for their own use, or for that of the poor'.

In the provinces, too, the provision of a good and cheap water supply was one of the chief duties of the communes. Libanius exalts his native city Antioch as excelling all others in this respect; the eighteen divisions of the city vied in supplying the best water for the baths. 'There are as many running streams as houses; several often in one house, and also in most of the workshops. . . . Our public fountains are mere ornaments, as every one has his own water supply at home. The water is so clear, that the full jug looks empty, and so pleasant to look at, that it invites drinking'. Libanius indirectly admits that other cities provided as much water; we know that in Smyrna every single house had at least one supply. In the cities of Pamphylia and Pisidia, *nymphaea* were in special favour, a kind of 'water castles', whence from the many mouths of gorgeous façades the water welled into large basins; the best preserved is the *Nymphaeum* of Side (very much like the Septizonium of Severus at Rome); the water gushes from three niches in a magnificent columned marble wall in nine streams into a basin 4,000-5,000 square

metres in size. In Caesar's time the Nile water at Alexandria was purified for use in private houses, but the mass of the people used it in its dirty condition, in which it was unhealthy ; later on, the whole population was supplied with filtered water.

In the African provinces, too, where water was doubly a blessing, even small places never lacked good water, as far as we can as yet say ; Verecunda received its water supply through Antoninus Pius ; and at Lambaesis Diocletian and Maximian restored the aqueducts. An aqueduct 25 *millia* long was made in 276 A.D. there by the third legion. In 152 A.D. one of its engineers was sent to Saldae (Bougie) to bore a tunnel for an aqueduct which had been commenced 147-149 ; the task had baffled native skill. The city of Thysdrus had been supplied with sufficient water by a water commissioner, appointed by the emperor ; it ran through the streets into basins, and was allowed to private houses on certain conditions. In Great Leptis the good and palatable water of the stream on which the town lies might easily have been brought in by covered channels, but it was thought preferable to conduct clear mountain-water high above ground into the city, besides the water of the Cinyps ; considerable traces of both aqueducts are left. Mauretania has been insufficiently explored, but the site of the southernmost Roman city of Sala (Rehat Saleh 34° N. lat. on the Atlantic) is evidenced by the ruins of an aqueduct. Arches of aqueducts, some very large, are still standing near Caesarea (Zershel), Constantine and elsewhere. In the *Nymphaeum* of Bulla Regia the water of the spring in the middle of the city fell over several terraces into a basin, to be conducted further still. The ruins of the huge aqueduct of Carthage are continuous for eight geographical miles direct, and double as long in their sinuous course. Cisterns and reservoirs are still in some places in use.

So too in the Western and Northern provinces. The Aqueduct at Segovia is as 'new as it issued forth from the hand of the designer, rises slim and light, nobly proportioned, and stands firm above the dirty town, and, after two thousand years, still supplies refreshing water' (J. G. Rist, 1804). Ausonius cannot find words enough to celebrate Divona the well at Burdigala, covered in with marble and nobly clear, 'breaking forth stormily through her twelve mouths in streams inexhaustible, despite the many uses to which it was put by

the people'. In 1855 there was not one stately fountain at Bordeaux. The Pont du Gard, consisting of three tiers of arcades bridging the Gardon in a wild, lonely ravine, is a remnant of the aqueduct, which conducted the splendid water of the springs Airan and Eure nine leagues further on to Nîmes. In 1854 a Lyons *savant*, who published the inscriptions on the ancient pipes there found, bitterly remarked: 'Our age, which boasts of its mechanics, and has so many new powers, unknown to the ancients, e.g., steam, is still unable to do for large cities what the Romans, despite enormous difficulties, did for their smallest. Ancient Lyons lay on a hill and was richly and amply supplied with clear good spring water; modern Lyons is in the plain between two rivers, which overflow it and yet supply no drinking-water, and has to be content with stinking water, dirty pipes and unhealthy air'. The Roman aqueduct started from the waters of Mont Pilat, and took up those of Gien, Jaunon and Furand, crossed the valleys (sometimes abysses of 200-300 feet on huge bridges of fourteen tiers) and was 15 *lieues* long. The aqueducts of Trèves, Metz, Mainz, Cologne and other cities brought it hard water, which the Romans recognized by its blue-green colour (like that of the Alpine lakes); it soon cured of itself cuts and slight injuries by its deposits of lime. The Cologne derives its excellent supply from the Eifel 52 kilometres away, and brings it in by underground channels, 70 or 88 kilometres long. Not long ago at Remagen two water-courses were used for a supply; and no one imagined that the Romans had already done the same at the same spot; the genius and simplicity and technical excellence were all the more admired. At Rome and elsewhere (e.g., Avenches and Cologne), the legend has attached to the remains of the aqueducts, that they were intended to carry down wine, illustrative at once of the grandeur ascribed to these ancient monuments of civilization, and of the manner in which their real purpose has been forgotten.

The aqueducts supplied the baths, public and private, which were common in Italy from early times and were rarely lacking anywhere later. In Italy there were mere villages possessing more than one set of baths, which could be used for a fee; in inscriptions of Italian and provincial cities, in endowments and legacies, no public purpose is more frequently mentioned

than the erection, maintenance and equipment of free public baths, hot and cold, for men and women, and even for slaves. In the provinces, too, the smallest communes recognized the duty of supplying good, cheap baths. In the communal decree of a mining village in South Portugal, the lessee of the public bath is to keep it open from daybreak to 2 p.m. for men, and from 2 p.m. to the second hour of the night for women; men paid $1\frac{3}{4}d.$, and women, $\frac{3}{4}d.$ (double the prices of Rome); fresh running water must be given in the cold and warm basins before and after noon and reach a certain temperature; the boilers must be cleaned every month and rubbed with fresh fat. According to Galen, the custom of a daily bath was common even for rustics; he rightly regards this as to some extent a sign of effeminacy, since people found it hard to do without it; Seneca, too, true to his point of view, regards the passion for cleanliness as a decay of morals; in the good old days, only the arms and legs were washed every day, and a bath taken only once a week. Sea-bathing was general all along the Mediterranean coasts of Italy, Greece and Egypt, as we know; in Germany, it came in after a long struggle, the oldest German sea-bath at Doberan was not opened till 1793.

The enjoyment of Nature—so far as the Romans felt it—was never more widely spread; as early as the last century of the Republic, 'the upper classes regularly spent the fine season in the country'. Even then the rich and great could generally select, from a variety of climate or scenery, what was best adapted for each season of the year; and inside the city the garden was the most valued part of a palace and doubled its value. The windows of the dining-rooms ought to look out on to the green. Even on flat roofs and balconies there were bushes and flowers; this form of luxury may have been sometimes carried too far, but the descriptions of the two Senecas must certainly not be taken literally. Even smaller houses displayed flowers and green in their windows, and Rome had many great gardens and parks, those 'lungs of great cities', some of which were public. At Signia (Segni) two communal officers presented the city with gardens; and such a provision cannot have been an isolated case.

As to the spread of luxury amongst the middle and lower classes, we have little knowledge, and then only of Italy. The

Mediterranean countries, thanks to their climate, have always had the finest corn as food, whilst the North has had to acclimatize slowly and laboriously. In Italy, even in Cato's time, slaves lived on wine, oil and wheaten flour; and, as has been said, Rome introduced wine into the beer-drinking countries. Inequality of wealth was indeed great, but not as pronounced as now. But then in the South poverty is not misery, and the after-effect of Republican manners tended largely to obliterate the difference between wealth and poverty.

The rich and great were still always expected to employ their excess both to support the poor—an object served by the huge system of *clientela*—and to allow them to participate largely in their pleasures, and to afford them advantages and amusements, in which the modern world gives them no share. The people, says Plutarch, hate the mean rich more than the open thief; the latter can plead necessity, the former show a haughty contempt of the people. And, according to Lucian, the poor often tyrannized over the rich, who had to build them baths, provide prize-fights and shows, distribute largesse, and yet live in dread of the displeasure of their fellow-citizens. How splendidly the prosperous in the Roman Empire provided for the comfort and needs of the communes will be dealt with later; these services, such as the baths, benefited the poor especially. 'To build and to give' was then the rich man's duty. In public buildings, institutions, and feeding the poor, private generosity went hand in hand with communal authorities. Endowments, gifts, and legacies for purchases of oil and meal for free distribution or cheap sale were frequent; and endowments to put poor parents in the position to educate their children up to the wage-earning age, not unusual; there is one instance known in the time of Augustus. Further, there were endowments for destitute aged. Burial-places for the poor were laid out by the communes and by individuals. Finally, the communes in their educational work were helped by the public spirit of the rich. About 100 A.D. in Como there was no teacher of oratory, the highest stage of learning, and aspirants had to go as far as Milan. Pliny the Younger, though childless, gave a third of the cost of the chair; he also presented a valuable library, and capital for its maintenance and enlargement; we may conclude that the generosity of municipals often aided education.

But far more was spent on public festivals and amusements, by the communes and by the rich, who thereby sought public favour. Custom obliged them to invite a large portion of the commune to their private feasts; on their birthdays, when their sons assumed the *toga virilis*, at a daughter's marriage, or on the assumption of a municipal office, a public building would be dedicated and many of the citizens and the council invited, often over a thousand, or a sum of money was distributed instead. Public festivities were mainly banquets to the whole community, and established annually by endowment or legacy, or they were of the nature of shows, amongst which *venationes* or gladiatorial combats were the most popular. The rich were, no doubt, often coerced by public opinion and its unmistakable expressions. In the city on the Gulf of Naples, the scene of part of the Petronian romance, one of the *honoratiores* is expected to provide a feast and largesse, and another three days' gladiatorial games; he had inherited 30 million sesterces from his father, and could well afford to win eternal fame for 400,000 (£4,350).

Of the very numerous provincial inscriptions, specifying the benefactions of citizens to their cities, three may be cited to show what sums even in second-rate towns the rich had to pay for the pleasure and convenience of the communes. In Philadelphia (Lydia), of two citizens who had held the highest offices and priesthoods, one (besides an unnamed contribution to the public purse) on becoming aedile, gave 10,000 *denarii*; for a 'fifteen days' cooking' (probably for the people), 5,000; for the fore hall to the basilica, 50,000; altogether 65,000 *denarii* (over £2,800); the other, several donations for himself and his sons, a *venatio*, 610,000 *denarii* altogether to purchase corn, 10,000 to roof the theatre, for one statue each to the seven guilds, 7,000; in all 627,000 *denarii* (£27,300). At Sillyon or Aspendos in Pamphylia one family (besides distributions of money and corn to eight sets of citizens) gave 300,000 *denarii* (£12,550) for the education of children. And hundreds of municipal inscriptions testify that in all cities of the Empire the whole population received much of the wealth of the rich, who gave up much more than could have been extracted by the heaviest income-tax.

State luxury was also largely directed to 'things enjoyable by all'. The magnificent imperial public buildings in Rome,

especially the *thermae*, the Games of the emperors and officials, the *congiaria* and *frumentationes*—however morally and economically unsound—yet benefited the whole people; whilst the luxurious houses and court-feasts of our days are only enjoyed by a minority of favoured individuals. And the public luxury of the communes throughout the Empire had the same democratic character.

Luxury and the civilization of the Early Empire no doubt had its seamy side, but was neither as mad or immoral as the one-sided rigorists, the writers of that time, have represented it, nor as fabulous as in Meursius' uncritical compilation. Despite all its faults and defects, that civilization was very high, 'and sowed many seeds which are still bearing fruit'. In refining the pleasures of life and spreading prosperity and the material conditions of a healthy luxury, this epoch surpassed all other ancient times; its luxury brought forth much that often, in a stunted form, has produced happy effects in later centuries and has made existence in our hemisphere more humane. The people of that time possessed many advantages, the attainment of which in our century is greatly valued, or as yet only attempted. Mommsen is right in his remark that 'the Roman Imperial Epoch is more abused than known'.

CHAPTER III

THE ARTS

I. ARCHITECTURE, SCULPTURE AND PAINTING

§ 1. AIMS AND APPLICATION OF ARCHITECTURE

WERE all other knowledge of Rome lost, there would be evidence enough of the great and mighty civilization that has passed away in the many ruins so widely scattered, and the immense remains of works of art found beneath heaps of débris and ashes. Most of the Roman buildings extant, and the largest, date from the Empire. They are found in desolate regions, landmarks of a civilization, that once extended over vast districts, mere deserts now, after centuries of barbarian rule: such are the huge ruins of Baalbek or Tadmor; or the hundreds of stone cities and villages abandoned but still habitable, in East Syria, with their characteristic arches, cupolas, pyramidal graves, or the many remains of Roman cities in marvellous preservation in Asia Minor and North Africa. Many disappeared only recently, e.g., the bridge of Almaraz was destroyed in 1806 in the Peninsular War, and the vast conduit over the great ravine of the Rummel, the only means of access to Constantine, collapsed in 1857. Often these ancient buildings in their magnificence, permanence and present utility put to shame their modern congeners, e.g., the bridges at Rimini, Alcántara and Mérida, Pont du Gard, the aqueduct of Segovia and others in the Mediterranean countries. 'A second Nature for civic purposes is their principle'. This vast confusing mass of ruins of all the arts gives a picture of the richness of the artistic decoration in the extremely numerous cities of importance in the Roman Empire, and makes modern attempts at beautifying and ennobling private and public life by art seem mean in comparison.

Such splendid and far-spread architecture and art implies

a degree of general civilization and prosperity unrealized in earlier ages. The Empire gave the world, weary unto exhaustion, almost two centuries of practically continuous peace, and to the provinces which had been plundered to the utmost, a more equal distribution of burdens and, at least, a tolerable rule. Order and security were restored ; traffic ' in the largest free trade realm that has ever existed ' grew apace ; and wealth and prosperity flourished as never before.

The continuous embellishment of cities in all the provinces is the most evident proof of this. The number of cities increased with new foundations, colonies, grants of civic rights and combinations of several small towns into a single commune, especially in Gaul and Spain, which were formerly administered by cantons (*pagi*). Under Augustus in Tarraconese Spain out of 293 communes only 179 were combined as cities ; according to Ptolemy under Antoninus Pius there were 248 cities. And ' in the Eastern provinces, in Galatia, Cappadocia and Hellenized Syria, slowly but gradually new communes arose, and even on the Danube, in Numidia and Mauretania the Roman garrisons caused many new cities to spring up '.

Only the growth of cities out of camps can be noticed here. In Africa Lambaesis (Lambessa) and Verecunda arose from the settlement of the third Legion there in 146 A.D., out of the barracks and huts of the hucksters, women, girls, contractors, workmen, etc., who were only allowed to settle about a mile off the camps ; Antoninus Pius made the places communes ; Lambaesis gained civic rights in 207, and Verecunda later, under Valerian and Gallienus. Lambaesis was connected with the camp by a good, square paved road, which entered the city through a triumphal arch with three gates, and continued through another arch on to Verecunda. The city abounded in stately buildings, temples, *thermae*, an amphitheatre, a *septizonium* in which several water-courses met ; in front of the principal temple was a kind of forum with statues of legionary legates ; in 208 the city got its capitol. When the legion went away, the town rapidly decayed. When the Byzantines were fortifying the towns of Africa, they raised a citadel there out of architraves, friezes, altars, tombstones and pedestals, and, as they left it, the French found it when they occupied Algeria.

Similarly in the Northern provinces there arose near the camps settlements of Romans in *cannabae*, generally close by native villages, which gradually amalgamated with the Roman town. Under Claudius the camp of the fifteenth Legion was removed to Carnuntum (apparently a large Celtic centre of commerce), now St. Petronell near Vienna; and Hadrian, when he stayed there, gave it municipal rights. Near the camp at Xanten (*castra vetera*) the long peace caused the erection of buildings 'after the manner of a town', which were pulled down in 69 so as not to give the rebel barbarians shelter in attacking the camp. The numerous small places near the great camp at Mainz became a Roman town first under Diocletian, and flourished in the fourth century; the architectural remains extant must have been part of a stately town. Strassburg, Alt-Ofen, Vienna, Iglitza, Karlsburg originated in the same way.

The panegyric of Aristides on Rome (152 A.D.), however fulsome, discloses the effect of great impressions, which were felt most of all in the East. 'When were there so many cities inland and on the coast, and when were they ever so bedecked? What ancient ruler could ever have in every day's journey reached a new city in his domain, or even have passed through two or three in the same day, as through streets? It might be said, all former monarchs were only kings of a desert with fortified posts, and only Rome mistress of cities. Amongst you all the Greek cities are now rising, and all their monuments do you honour; inland and on the coast are numerous cities, founded or extended by your efforts. Ionia in grace and beauty ranks first and outdoes its own past, as much as it outdid erstwhile all other countries. The proud city of Alexandria is a gem in your diadem, a necklace beside many other jewels. The whole earth has donned a garb of rejoicing, has doffed her old dress of iron, and turned to pleasure and magnificence. All cities are possessed by one ambition, to appear the loveliest. Everywhere are wrestling-grounds, aqueducts, *propylaea*, temples, workshops, schools; the earth, once sick, has been restored to health. Incessant gifts come from your hand; in your impartial grace no city is favourite. They gleam in splendour and beauty; the earth is become as a garden'.

The rhetor's admiration of the many beautiful cities is justi-

fied by ruins and by other facts. Aelian says Italy 'once' had 1,197 cities; but gives no date or authority; probably Italy, despite some local desolation, flourished most and had most great cities from the time of Augustus to Marcus Aurelius. In 44 B.C. the triumvirs assigned the eighteen principal cities of Italy 'in wealth, architecture and beauty' to the soldiers, and of these Appian says the most important were Capua (which even under Domitian ranked not far behind Rome, and was reckoned by Ausonius among the fourteen great cities of the Empire), Rhegium, Beneventum, Venusia, Nuceria, Ariminum, and Hipponium (Vibo). In Central Italy ruins like those of Oriculum and Asisium show the size of even the smaller ones. Centumcellae (Cività Vecchia), which is seldom mentioned, was a great and flourishing city in the time of Procopius. In Lower Italy the remains of Pompeii and Herculaneum have proved that places seldom mentioned had numerous stately public buildings decorated in good style. Under Domitian Naples was a splendid and artistic town with many temples, and colonnaded squares. Of the sixty-three cities of Sicily towards the end of the Republic the greatest and most prosperous was Centuripae with 10,000 citizens (some 100,000 inhabitants). Syracuse and Catina (Catania) Ausonius mentions in his fourteen. Corsica possessed thirty-two cities.

Cisalpine Gaul in Strabo's time surpassed other countries in the wealth and greatness of her cities and Verona and Ariminum (Rimini) are now the richest in Roman remains. Cremona, down to its destruction in 69, was rich and populous. Ravenna was built in the water on piles, an ancient Venice, with communications by bridges and boats. Mediolanium (Milan) in the Late Empire became the 'first city in Italy after Rome for population, size and wealth' according to Procopius; but his estimate of 300,000 adults slain when Milan was destroyed by Witichis must be exaggerated. In Venetia, in Augustus' time, the most important town was Patavium (Padua), with 500 families possessing at least the equestrian census. Aquileia, the great emporium of northern trade, 'in more than one sense the mother of Venice,' was the fourth city of Italy in the matter of population (after Rome, Capua and Mediolanium). Outside the double wall there were extensive suburbs. The city was razed to the ground, but the foundations abound with industrial products. At several places in

Istria noble ruins are still standing, e.g., at Tergeste (Trieste), Tarsatica (Fiume), Parentium (Parenzo). But Pola has preserved the most important Roman remains, one temple wholly, another nearly destroyed ; a triumphal arch with rich decorations ; the famous amphitheatre that could contain 20,000–25,000 spectators ; the remnants of a theatre destroyed in the seventeenth century were excavated some thirty years ago ; in the nineteenth century the city walls were pulled down in part, but two gateways remain.

Josephus, quoting an official list, gives about 1,200 as the number of cities in Gaul ; though some, or most, under the Empire, may have been large villages, many, at least in Narbonese Gaul were much larger than their modern substitutes. Of the nine specified by Pomponius Mela about 50 A.D. as the most considerable, Vasio (Vaison) and Baeterrae (Béziers) have scarcely any Roman traces left, but Avenio (Avignon), amongst a considerable number of ruins, can show a triumphal arch of the Early Empire ; the remains at Arausio (Orange) are grand, the triumphal arch and the theatre being very well preserved. In Mela's time, the most important town was Narbo, the residence of the Proconsul and the principal harbour of Gaul, a town belauded by Apollinaris Sidonius about 450 A.D. ; traces of its former glory may still be seen. The finest and best preserved Roman buildings in Europe outside Italy are at Nemausus (Nîmes), which reached its apogee under Hadrian and the Antonines, and Arelate 'the twofold town' (after Constantine's reign it spread over both banks of the Rhône), the 'Gallic Rome', as Ausonius calls it ; it flourished most after Lugdunum declined, and was still a thriving commercial city in the fifth century. The amphitheatre of Nemausus had seats for 20,000 spectators, and that of Arelate for 25,000. Tolosa, with Narbo, became a city of the first rank towards the end of the fourth century, and consisted of five towns, four of which had grown out of the first, all surrounded with huge brick walls. Vienne, formerly an open village, became a city under Augustus, and was surrounded by him with a wall $3\frac{1}{2}$ miles long, and abounded in fine buildings ; it contains the ruins of a Temple (perhaps of Augustus and his wife Julia), an amphitheatre, a theatre, *thermae* and a *porticus*.

Vienne was the second capital of Gaul. The first was Lugdunum (Lyons), the residence of the proconsul of Gallia

Lugdunensis, the administrative centre, situate at the confluence of two broad streams and the intersecting point of the main roads ; it soon became a very prosperous city, and, even under Nero, was full of splendid buildings, any one of which would have been an ornament by itself. But the 'great rich city' was destroyed in 197 by the soldiers of Septimius Severus, and never wholly recovered. The 'little town of the Parisii' (as Julian calls Lutetia) had also spread from the island in the Seine to the left bank ; the remains of the so-called *palais des thermes* are well known ; an amphitheatre of the third century was discovered near the Panthéon. Augustodunum, formerly Bibracte, the capital of the Aedui, had, like Vienne, walls about $3\frac{1}{2}$ miles round, with 220 turrets and two three-arched gateways ; in the seventeenth century there were remains of a theatre and amphitheatre, the largest known (157 metres by 131).

In Aquitania, about the middle of the first century, the principal town was Eliumverum (Auch). Burdigala (Bordeaux), though of course the most important commercial city on the Atlantic, is not mentioned as a large town before the end of the fourth century, and the ruins are in late Roman style. The walls were square with lofty turrets, and gateways exactly opposite, the streets broad and regular, and the pride of the town was its spring Divona, which lavishly supplied it with water.

In Belgica, even under Augustus the city of the Remi (Durocortorum, Rheims), the residence of the governor, was a populous town, and of consequence even in the fourth century. The capital of the Treviri (Trèves, Trier) was settled under Claudius as a military colony, and is mentioned by Mela as an important town ; its walls were 6,418 metres round, enclosing a space of 285 hectares on the right bank of the Moselle ; it thus was nearly twice as large as the medieval, and, up to recent times, as the modern town ; the wall with the Porta Nigra was built about 250 A.D. It was most flourishing in the fourth century, when the emperors often resided there ; and to this period must be assigned the splendid buildings, remains of which can still be seen ; the amphitheatre is earlier. The city of the Ubii was under Claudius a frontier fortress, and in 50 A.D. as a military colony, received its new name of Colonia Agrippinensis (Cologne) ; in 71 even its prosperity made it

an object of the envy of the Germans on the right bank. Its circular wall (of the same period as that of Trèves) encloses some 97 hectares, holding a population of some 30,000 souls. Cologne and Deutz yield a good crop of architectural fragments, sculptures, mosaics, metal-work, and glass and clay vessels. In West Switzerland, as the ruins show, Vindonissa (Windisch, the station of a legion until the frontier was removed), Salodurum, Turicum, Lousanna, became flourishing towns ; Baden, near Zürich, was at the beginning of the second century a lively spot 'built like a city'. Aventicum (Avenches), the principal city of this part, was 'little inferior in splendour and public buildings, and the luxury of the richer homes to any provincial town of the West'. The walls were protected with, perhaps, low turrets ; there was a magnificent water supply, a theatre, and an amphitheatre for 17,000 spectators.

Tarraconese Spain (i.e., the North and the East) had under Augustus 179 independent communes, and 248 under the Antonines ; the capital, Tarraco, had numerous temples and public buildings and statuary, and houses, villas, and sepulchral monuments testified to its prosperity. Baetica (Seville, Cordova, Granada and parts of the adjoining provinces), under Augustus had 175 cities, amongst them Gades, the second city in population after Rome, with 500 citizens, possessed of at least 400,000 sesterces, one of the richest and greatest cities in the monarchy. 'The ruins of Emerita Augusta, the capital of Lusitania, one of the fourteen cities mentioned by Ausonius, aroused the admiration of the Arabic writers ; they were then in better preservation, and although used as quarries for centuries, even now the circus, amphitheatre, city walls, aqueduct, a bridge over the valley of the Anas with eighty-one arches are almost perfect, and there are numerous remains of temples, statues, more or less in ruins'.

In Africa, too, the cities increased in number and prosperity up to the end of the third century. Ptolemy already estimates 324, with only a very few hamlets amongst them. In a lateral valley of the Medjerda (Bagradas) in a zone of 55,000 hectares there are six cities only a few kilometres apart ; and further South on the plateau, sloping down to Shotts (Salt Lakes) and the sea, the cities lie all a day's journey apart. The military colonies, of which we know 33 in the two Mauretanas, 50 in Numidia and Africa (there were only 6 in Pliny's

time), caused cities to magnify and increase in number, since villages in which veterans settled soon grew up into cities. In many of the 'towers' and castles, used as the places of refuge by the agricultural population, when invaded from beyond the frontiers, the permanent inhabitants increased to such an extent that they were able to claim, and obtained, civic rights. How Lambaesis and Verecunda arose has been explained. Rural communes, which were attached to independent city communes, also became independent, e.g., Chullu, Mileu, and Rusicade (Philippeville) at first united with Cirta, about the end of the third century. Rusicade was rich in public buildings and statuary. Similarly the rural communes of Thignica, Thibursicum Bure, Thugga, Agbia, all became cities under Gallienus, and their magnificent ruins give some idea of their prosperity.

The Roman cities in Africa prospered most from the reign of Hadrian to that of Severus, as their ruins testify. Some lay too near Arabian towns and were exhausted as quarries, e.g., Carthage, which has now almost entirely vanished, but in the third century vied with Alexandria as the second largest town after Rome, or Utica, or Hadrumetum (Susa); of others, which are never mentioned in ancient literature, e.g., Uthina, Seressita (now Um-el-Abwab, Mother of Gates, so called from the four gates still standing), Cillium, Sufetula, considerable ruins remain. In the valley of the Medjerda, an African Campagna, now sparsely inhabited, and a fever-haunt in the spring, every step brings one on to ruins of Roman temples, baths and aqueducts, with heaps of ruins to indicate former towns, or here and there magnificent buildings inscribed and carved, towering over the miserable Arabian *duwars* (circles for penning cattle). In Great Leptis, whence whole ladings of columns have been transported to France and England, in the western part of the town, now buried deep, many remains of buildings can still be seen, remarkable alike for costly material and many huge columns. The ruins of Thamugadi (Timgad, an African Pompeii buried under the sand), and of Thagaste, the native city of St. Augustine, and Madauri, that of Apuleius, are very extensive. Theveste (Tebessa) is 'an ancient city with ancient houses, in part still inhabited, though a far larger number is buried deep in ashes': a temple, like the *maison carrée* at Nîmes, *thermae* like those of

Caracalla, the forum, a basilica and other buildings are well preserved. There are plentiful remains too of Sitifi and Caesarea, the capitals of Eastern Mauretania; Caesarea was one geographical mile round, eight times as large as the modern Zershel. The ruins of Volubilis (a triumphal arch, a temple and the wall) though long quarried out for the neighbouring town Miknes, still cover one hill. The population increased under the Empire, for the cities prospered and, according to Herodian, in the third century there was a considerable agricultural population. Procopius states that through the Vandals 5,000,000 men lost their lives in Africa.

The population of Egypt was 7,000,000 under the Ptolemies, and in the first century 8,500,000, about 800 to the square mile. In ancient times there were 20,000 towns, under the Ptolemies 30,000. It still abounded in cities, certainly most of them small, but Pliny gives forty of importance, including Alexandria, with a population of about 1,000,000, almost equal to Rome in splendour and size. Arsinoe had at least 100,000 inhabitants. Even in the fourth century, Egypt, Libya and the Pentapolis had a hundred episcopates.

Antioch, the capital of Syria, was the rival of Alexandria in size, splendour and wealth, consisting of four cities each with its own walls, besides the surrounding wall of the whole; like Alexandria, it had two main colonnaded streets, crossing at right angles, the longer of which was 36 stadia long. According to Libanius its aqueducts were the best of any capital, and in Antioch alone (as far as we know) in the fourth century, the streets were lighted at night. Apamea on the Orontes also had two main streets, about a mile and half a mile long, also crossing at right angles, and 117,000 free inhabitants in 5-4 B.C.; the acropolis, on which there is now an Arabian village of 100 houses, had room enough for at least 400-500 houses. From Apamea to where the Orontes turns seawards, on its right bank there are now 'for 90-115 miles ruins of about 100 places, with roads still recognizable, the buildings of massive stone (except the roofs), the houses with colonnades around, and galleries and balconies, the windows and gateways tastefully decorated with stone arabesques, gardens and baths, guest-rooms on the ground floor, stables, vats and oil-presses hewn into the rocks, and sepulchral chambers, with pillared entrances, hewn into the rocks and filled with *sarcophagi*'.

These were the country homes of the merchants of Apamea and Antioch, settlements dating from about 300-550 A.D. ; and, no doubt, preceded by villas less durable ; up to a certain point the prosperity of the Syrian merchants, of which we have a picture here, can be assumed for the Earlier Empire as well. 'Damascus, the great and holy' is called by Julian, who extols the beauty of its temples and the splendour of its numerous aqueducts, the eye of the East. Samosata on the Euphrates was a great populous city with a large temple of Zeus. Palmyra, which belonged to the Empire in the first century, owed its importance to the caravan trade with the towns on the Euphrates and the Persian Gulf ; and 'the temples still standing and the great colonnades of the city markets and the massive decorated tombs', bear witness to its prosperity ; 'thanks to the underground water-supply and huge reservoirs of square blocks of stone, traces of which yet remain in the neighbourhood, the now barren ground must then have been very fertile'. After the destruction of the city by Aurelian (273 A.D.) 'commerce sought other roads ; on the meteoric glory of Palmyra followed the desolation and stillness of its ruins'.

In Phœnicia, the largest cities were Sidon and Tyre, with their six-storeyed houses ; and Zabulon, according to Josephus, had fine houses, like Sidon, Tyre and Berytus. Ptolemais too, was a large town, and Arados very populous, with many-storeyed houses. In Palestine, after Jerusalem (with 600,000 inhabitants in 70 A.D.) came Gaza, and Caesarea, the splendid harbour-town founded by Herod, where the Tetrapylon, a triumphal arch with four gates, probably at the meeting of the two main streets, was worth visiting even in the fourth century.

In Eastern Syria and the Nabataean country the constitution of the province of Arabia and the establishment of a legion in Bostra as the capital (106 A.D.) brought the only epoch of peace and good government these regions, now a desert, uninhabited save for roaming Bedouins, have ever enjoyed ; to the time of Roman dominion (Trajan to Justinian) almost all the architectural remains belong. The Ledyâ, a lava plateau, some forty miles long and twenty-five miles across, is now unpeopled, but was then highly cultivated ; the road connecting Bostra and Damascus passed through it, and there are ruins

of twelve large and thirty-nine smaller places. The very first Roman governor had aqueducts built, bringing the water of the Hauran to Kanatha (Kerak) and Arrha (Rahâ). Bostra was connected by road with the Persian Gulf, and became a great trade centre, sharing with Palmyra and Petra the Eastern commerce with the Mediterranean; the long rows of stone huts testify how great it was, and still might be. For want of wood, the buildings on the Hauran were all of stone and give a vivid idea of the peculiar civilization of the 500 years between Trajan and Mahomet. M. de Vogüé says that the Roman dominion created an architectural impulse which did not die out; in a few years, houses, palaces, baths, temples, theatres, aqueducts, triumphal arches and cities arose from the ground with all the symmetrical regularity of mushroom cities, a uniform style for this part of Syria under the Empire. The Eastern slopes of the Hauran contain about 300 such deserted cities and villages, in contrast with the five towns of the present day; some of them having 800 one or two-storeyed houses, still habitable, all of basalt with well-fitted square blocks without cement, ornamented or inscribed doors, and flat roofs of stone beams supported by stone arches and made rain-proof with cement. The style is the ordinary imperial Greek with some indications of the older oriental. The stone arch and the cupola invest these buildings with a technical and architectural originality. The city wall generally only consists of the backs of the houses, and is protected by numerous turrets. In front of the gates are the cisterns, underground or roofed over with stone; the Bedouins still keep some of them in repair.

Gerasa, one of the Roman towns in that district, has a wall of square blocks $4\frac{1}{2}$ miles long and 7-8 feet thick; the principal temple has 250 columns, and there are two smaller temples, two amphitheatres (possibly), several large baths, aqueducts and other ruins; the main street, paved with blocks still in fair preservation, was enclosed by colonnades on both sides. A necropolis full of graves showing the large population, surrounds the city on all sides. Philippopolis was first made a city by Philip the Arab, and seems from its ruins to have been an important town, surrounded by a right-angled wall, with two main streets intersecting at right angles, a theatre, aqueduct, baths, temples and numerous public

buildings. The splendid buildings of Petra, the old residence of the Nabataean kings, mostly hewn in the living rock and of the Roman period, exhibit all the fantastic extravagances of the decadent architecture and sculpture of the second and third centuries. 'The tombs, hewn out of the cliffs east and west of Petra and in the clefts are unartistically, but massively decorated with superposed rows of Doric or Corinthian columns, and *propylaea* like those of Egyptian Thebes. Only great prosperity and vigorous life could thus have provided for the dead'.

Of the 500 cities in Asia (including the coast and islands of Ionia, Aeolis or Doris, Phrygia, Mysia, Caria and Lydia) repeated mention is made; this number is official. Cyzicus was one of the most opulent and magnificent cities of the province of Asia, and of all Asia Minor: its greatness is witnessed to by the ruins of its theatre and amphitheatre, and, inland, the principal city was Apamea (Κίβωρος). Eleven cities in 26 A.D. competed for the honour of erecting a temple to Tiberius: five, amongst them Laodicea, were at once rejected, as too unimportant, yet Strabo says of Laodicea that wool and agriculture had made her rich, and the munificence of her citizens had made her great. One Hiero bequeathed to her an inheritance of over 2,000 talents (£500,000) and had, besides, embellished the city with buildings and monuments; his example was followed by Zeno the rhetor and Polemo, whom Antony and Augustus made king. This affords an estimate of the wealth and splendour of the cities allowed to compete (Halicarnassus, Pergamus with its 120,000 inhabitants, Ephesus, Miletus, Sardes and Smyrna). Pergamus and Ephesus were accounted the jewels of Asia; Ephesus was the residence of the Governor and was considered one of the best built and most populous cities in the world, but Smyrna's claim to be the most beautiful was undisputed. Aphrodisias, despite the use of the older buildings for erecting a wall in the fourth century and of its ruins as a quarry for centuries, still has large Roman remains, and the same may be said of Stratonicea. How prosperous Aphrodisias was is shown by the numerous stone inscriptions recording the outlay on spectacles down to the time of the Gordians. The capital of Rhodes (probably incorporated with Asia under Vespasian) was the richest and most flourishing Greek city down to its destruc-

tion by an earthquake about 150 A.D., and one of the most splendid and well built cities in the world.

In the rest of Asia Minor, the waterless interior of Phrygia, Lycaonia, Galatia, Cappadocia was only suited for pasturage, and even then thinly populated; the coast-land, however, did not stand behind that of Asia. In Bithynia, Nicaea and Nicomedia vied for the first place. Nicomedia, according to Ammianus, had been so greatly extended and embellished by the later emperors, especially Diocletian, that it seemed to Julian like a part of Rome for its masses of public and private buildings: except by Rome, it was then only surpassed by Antioch, Alexandria and Constantinople in size, and by none in beauty. In Pontus, where Amasea the old capital of King Mithridates still flourished, Trapezus (Trebizond) first became a town of consequence under the Empire. The population of Caesarea, the capital of Cappadocia, was reckoned at 400,000 in the third century. Melitene, a fortress on the Armenian frontier, made a city by Trajan, grew to be large and populous, spreading below the fortress. The plain was covered with temples, official residences, streets, and the market, shops, warehouses, columned halls, baths, theatres, and all that pertained to a great city; Justinian surrounded it with a wall.

But the massive and well preserved ruins in Pamphylia and Pisidia, now 'a forgotten corner of the world', afford the best idea of the number, splendour and greatness of the cities of Asia Minor at this time. A triangle, whose base is the coast-line from Adalia to Side (75 kilometres, with two sides of 30 and 45 kilometres) much smaller than the triangle of Berlin, Küstrin, and Frankfort on the Oder, encloses the five cities of Pamphylia (Attaleia, Perga, Sillyon, Aspendus and Side). Termessus, situated 3,000 feet high in a hollow in the hills and overlooking the sea, is a 'magnificent and perfect picture of an ancient city with all its main parts, temples, a theatre, gymnasium, public buildings all about the beautiful and regular market, and acres of tombs on the slopes'. Perga looks like a place inhabited or only just abandoned. On the acropolis, for a length of 900 metres and a breadth of nearly 600, the embattled walls stand perfect with turrets 70 paces square, in many cases as high as when first built. The roads cross at right angles: from the southern gate a street flanked with columned halls leads up to the centre of the citadel;

the theatre and stadium could seat about 11,000 spectators. The ruins of Aspendus include a magnificent aqueduct, which brought the water over the hills, the ruins of the stadium and a theatre for 7,000-8,000 spectators. Side stands on a narrow peninsula and is walled off towards the mainland : a second strong wall on the mainland encloses the theatre, which could seat about 13,000 spectators, and rises like a mountain out of the low-lying heaps of the city ruins. The excellence of its water supply system has already been mentioned. The main street, lined with bazaars, is 700 metres long and 9 metres broad, with colonnades on the level and on the first floor, behind which were the shops. The ruins of Selge are in two parts : the strong fortified upper city with two acropoleis with the ridge in between, which was the best part of the town and contained the public and sacred buildings ; and the lower, in which there still stand five pillars of a colonnade which once surrounded the whole market place ; and, above it, the theatre (for about 8,000 or 9,000) and the stadium. In the *Kremna*, which is 1,000 metres high, Augustus planted a Roman colony, and most of the buildings belong to the middle and late Empire. Sagalassus stands on rising and undulating ground : 'every one of the eminences was crowned with fine buildings, connected by colonnades and steps and terraces ; the ruins afford an excellent idea of the eminently picturesque effect'. They include a Corinthian temple (possibly of the time of Trajan), a theatre, and, above the theatre, a very large temple. Even a little city like Sillyon had a theatre, an Odeum, and a stadium. 'Towards the end of the second century, shortly before the approaching decline, these cities must have conveyed the impression of great works of art in one style throughout, of ideal pictures, with their picturesque circular walls leading to well kept roads with tombs on each side, and the straight streets, public places, temples, baths, gymnasia, or markets in every quarter, and the citadel with proud columned buildings, the home of the patron gods of the city'. The remains on the Cilician coast are as well preserved as on the Pamphylian, and 'the comparative poverty of material and style is all the more striking'. Antioch on the Cragus with its two streets of bazaars and the magnificent marble temple is an exception. Remains of streets of bazaars are also to be found at Pompeiopolis, Seleucia on

the Calycadnus, and Hierapolis-Kastaba. A large city fortification, a theatre and a large aqueduct testify to the former importance of Mopsuestia. The inside of Anazarba, an abandoned city, is buried deep, and overgrown with vegetation, out of which some few columns of former bazaar streets project; there are also remains of two great aqueducts, a theatre, a stadium, and an amphitheatre.

Here and everywhere, 'where a forgotten corner of the world is investigated after the desolation of 1,500 years, the first and strongest feeling is disgust and shame at the miserable present in contrast with the glorious past under Rome'. When, under Claudius, Lycia was made a province, the old hill-city of Cragos was brought into the plain, and, on the market place of the new city of Sidyma, there are still remains of the temple to Claudius with its four columns, and of a stately bazaar with columns, which a native and wealthy physician built for his city. Statues of the emperors and retired citizens decorated the market place: there was a temple of Artemis and Apollo, the patron deities, baths and gymnasia for the young and the older citizens; from the gates right down to the harbour of Calabatia there were rows of stone tombs, more stately and costly than those at Pompeii, and many still standing. Cragos-Sidyma was not a city of the first rank in the little province of Lycia; there was no theatre, no honorific title; it was a little provincial town, created by the Empire. But in the whole vilayet of Aidin there is not a single inland town to compare in civilization with this little mountain city.

Byzantium, the largest and most prosperous city in Thrace, was taken in 196, after a three years' siege, by Septimius Severus and almost entirely destroyed, and deprived of theatres, baths, ornaments and even of its city rights; the huge walls of square blocks ($4\frac{1}{2}$ miles long) with lofty defences and numerous artistic turrets, aroused admiration even in ruins. Inland, in the days of independence, there had been nothing but villages and castles, except for Philippopolis (which had a population of 100,000 in 251, when taken by the Goths), but under Roman rule large places arose or became cities, especially under Trajan and Hadrian (Hadrianopolis). Thessalonica, the capital of Macedonia, is celebrated by Lucian in a speech he delivered there for its beauty, population, wealth and splendour, and called a city containing everything desir-

able. Salonaë, the capital of Dalmatia, was, with Aquileia, the principal commercial centre in these waters, and must have been one of the most populous and wealthy cities of the West: it had a wall with eighty-eight towers and three gates. In the seventeenth century the remains were considerable, but have now been used in new buildings; there are still fragments of a theatre and amphitheatre. The huge palace built by Diocletian about two miles from the sea was laid out like a camp, and, from outside, looked like a rectangle (175 by 215 metres) with a wall round it, and four towers at the corners. The modern capital, Spalato, is largely contained inside its walls, and the old temples serve as a cathedral and baptistery. In Jader, too (Zara), there are columns and blocks of architraves, remains of ancient pomp, and two lofty arches near Kistagen mark the site of the ancient Burnum.

Greece (without Thessaly and Epirus), though impoverished and desolate, under the Antonines had on the mainland over 100 places with a real civic life, 60 of which were in the Peloponnese, and a number of villages besides: most of them had decayed, with some exceptions; Tithorea, according to Plutarch, had grown. Of the new splendour of Athens through the buildings of Hadrian and Herodes Atticus mention will be made later. Corinth, the capital and residence of the governor, was also a Roman colony, rich, brilliant and populous. Nicopolis, founded by Augustus as a memorial of the battle of Actium on the southernmost point of Epirus (4½ miles north of Prevesa) was 'as the extensive ruins and finds of coins show, comparatively populous'.

In the North, too, cities grew up at a surprising rate. Even in Britain, a gradual conquest and the scene of constant revolts, with few traces of city life, the Roman towns were not poor in architecture. Camulodunum (Colchester), the capital, was easily captured by the insurgents in 61 A.D. (18 years after the conquest) because it had been designed rather for pleasure than strength. There was a *curia*, a theatre and a temple of Claudius, which the Roman soldiers could hold for two days. Londinium was a great commercial centre: there and at Verulamium (St. Albans) in 61 A.D. 70,000 citizens and provincials were slain. 'The considerable finds in the soil of London of Roman relics of fine buildings' confirm this. Viroconium, too (Wroxeter), was excavated in 1861 and almost proved a

British Pompeii. In Bath, where there is no trace of civic life, there are considerable ruins of *thermae*, and of one temple, and slighter traces of other temples ; at various places in the island temples occur mentioned in inscriptions. Agricola utilized his first winter (78) in Britain in accustoming the rough and scattered warriors to the enjoyment of peace and quiet, by encouraging the building of temples, *fora*, and houses ; baths and colonnades soon followed. So soon did this farthest province bedeck itself architecturally, where one generation earlier Caractacus had wondered, after the sight of Rome, that the owners of such pomp could desire barbarian huts.

The plain on the right bank of the Rhine and the Neckar district up to the 'rauhe Alp' (in Suabia), including the Black Forest, was only held by Rome from the end of the first century to about 250 A.D. ; yet in Württemberg alone at 160 spots there are traces of Roman settlements, and city life flourished as much inside this new confine as on the left bank ; 'Sumelocenna (Rottenburg am Neckar), Aquae (civitas Aurelia Aquensis, Baden-Baden), Lopodunum (Ladenburg) were, except as compared with Cologne and Trèves, the equals of any city in Belgica : and the Roman settlement near Wiesbaden (Aquae Mattiacae) was also important. Vindelicorum (Augsburg) was founded under Augustus and named after him ; the Perlach there is a reminiscence of the Roman amphitheatre, and many inscriptions and sculptures testify to its ancient prosperity. But it was the only centre of Roman civilization in Raetia ; Noricum, the adjoining province, was so thoroughly Romanized as to become 'an outpost or even a part of Italy'. The little standing camps in Noricum, and even the stationing of a legion at Lauriacum near Enns by Marcus Aurelius had little importance ; for the larger towns Celeia (Cilli), Aguontum (Lienz), Teurnia (near Spital), Virunum (Zollfeld near Klagenfurt), the centre of the province, of which there are very considerable ruins, and Juvavum in the North (Salzburg) were made up entirely of civil elements.

But the civilization of Pannonia was entirely due to the presence of three (later, apparently, only two) legions : under Vespasian, the capital was Carnuntum (Petronell, East of Vienna) and Vindobona (Vienna) ; there are extensive ruins

of the city that grew up beside the former. It was only after this time that the government began organizing into cities the province, which up to then had only had towns in the western half, Emona (Laibach), Savaria (Stein am Anger). In the Western portion, which originally belonged to Noricum, Scarbantia (Ödenburg on the Neusiedler Lake), Siscia (Sziget), between the Save and the Drave, and Sirmium (Mitrovicza) received city rights under the Flavian emperors; Poetovio (Pettau) under Trajan; Mursa (Eszeg) became a colony under Hadrian. The principal places were Sirmium and Savaria, which retained its Roman name up to the Magyar conquest in the tenth century, and abounds in Roman remains.

In Moesia the development of cities was less even than in Pannonia. Here too Italian civilization spread from the camps, of which the oldest were those at Singidunum (Belgrade), and Viminacium (Kostolatz): the importance of the latter is shown by a large field of ruins, and the multitude of the artistic remains smuggled through Servia. In Lower Moesia (between the Balkan and the Danube), Roman civilization began with the establishment of a legion at Novae (near Svishtova), Durostorum (Silistria) and Troesmis (Iglitza near Galatz).

Even in Dacia, the latest province and abandoned after 170 years (comprising Transylvania, the Banate, Moldavia and Wallachia), 1,500 years have not fully destroyed the Roman work. The country was re peopled with settlers from various provinces (especially Dalmatia and Asia Minor) and the Roman city system spread more thoroughly than in the other lands on the Danube. A large number of most various remains attest the existence of over 100 more or less prosperous Roman towns, mostly in Transylvania. Sarmizegetusa, the capital converted by Trajan into a Roman colony, remained the central town and governor's residence; twelve Wallachian villages occupy its area; the rock of the capitol, and the arena of the amphitheatre may still be seen. How important the military centre, Apulum, was, is shown by the extensive ruins round about the modern Karlsburg. A series of village communes grew in Dacia into cities, and the military and road stations, the network of which covered the country, gradually became more or less cities.

These facts, which might easily be amplified, prove the

literal accuracy of Pliny's statement in a letter to Trajan, that no province lacked skilful and inventive architects. Many were in the service of the State, as engineers and building experts in the armies, but the private architects must have been far more numerous.

Municipal patriotism, one of the best aspects of ancient city life, so highly developed and promoted by the relative independence of the towns, incited the communes and private citizens to provide necessary and useful buildings and institutions at enormous cost and sacrifice. In ancient times the fervent desire of each man to present a worthy and splendid appearance actuated also the corporations, and drove them to efforts often beyond their power. This was accentuated on Greek soil by the 'ancient Hellenic disease', the fierce jealousy of the cities amongst themselves.

The Roman colonies were to be 'microcosms of the capital', as their adaptation of Roman names showed: two cities colonized under Augustus, which had seven districts each, Ariminum and Antioch in Pisidia, named them after Roman regions, e.g. Cermalus, Aventine, Velabrum, Vicus Tuscus; this must have been a common usage. Thus Falerii had a Via Sacra, Ostia a Campus Martius, Herculaneum a Palatine region, Beneventum an Esquiline, Lugdunum and Mattiacum, the capital of the Chatti, a Vatican, Aquileia, a region called Serapis and Isis. The right of having a capitol, which, as at Rome, had its temples of Jupiter, Juno and Minerva, or of setting up a statue of Marsyas on the forum, as at Rome, up to Caracalla's time was limited to colonies. At some places, e.g., Cologne, Trèves, Florence, Cagliari, the tradition has been preserved in such church names as Sta. Maria in Capitele.

Public building was intrusted either to special commissioners (*curatores operum*) or to annual officials, who generally accepted the lowest tender and took them over after completion. 'When cities are letting out a contract for temples or *colossi*', says Plutarch, 'they listen to the competing artists, who submit their designs, and then select the cheapest and promptest offer.'

The extent, import and object of city buildings is shown by the correspondence between Pliny, when governor of Bithynia, and Trajan (c. 111-113 A.D.). Imperial leave was necessary for all new erections. Pliny obtained such a licence

for a new bath at Prusa on Olympus, 'as the glory of the reign and the dignity of the city demanded'; the bath was built on the ruins of a house, and one of the ugliest places in the town was made beautiful. At Nicomedia an aqueduct, which had cost the city 30,329,000 sesterces (£330,000) was begun and abandoned, as also a second one on which 200,000 sesterces had already been spent. Trajan then sanctioned a third aqueduct, which was to bring water into the upper city as well on arches, partly of square blocks, and partly of bricks; Pliny assured him that in utility and beauty it would be worthy of Trajan's reign. Shortly before the city had commenced building a new forum. At Nicaea a new theatre had already absorbed over 10,000,000 sesterces (£108,750); private individuals had guaranteed the decoration of it with a colonnade above the auditorium and basilicas around. But before the main building was finished, great fissures rendered repairs almost useless. At the same time, in place of the old gymnasium, which had been burnt down, a much larger one was laid out; but the architect who undertook to complete the work declared the walls too weak for the contemplated load, despite their immense thickness (22 Roman feet). At Claudio-polis huge city baths were in progress. For an aqueduct to bring water 16 *millia* to Sinope Trajan gave his licence, should the expense not be too much for the city, as it would contribute to health and amenity. Amastris, a fine and splendid city, possessed a long stately street, along the whole length of which a malodorous water course flowed: Trajan sanctioned its being filled up at the expense of the city.

This prosperity of the cities and the outlay on civic architecture in Bithynia may be presumed for the rest of the Empire. Buildings to benefit a whole district were undertaken by several cities in common, e.g., the bridge at Alcántara finished in 105-6 at the cost of eleven *municipia* of Lusitania.

Part of the regular city revenue was the entrance-money paid by men and women elected to posts of honour and priest-hoods, or to the decurionate, or the second rank, the *Augustalitas* and the *seviratus* which controlled it. These fees varied according to the importance of the place and the office. For the duumvirate 2,000, 3,000, 4,000 or 10,000 sesterces were paid (10,000 at Pompeii); for the aedileship 4,000, even 20,000, for the decurionate 1,000, 2,000 or 20,000; and for priest-

hoods, by the pontifex 10,000, or even 55,000, for the flaminiate 2,000, and at Verecunda and Diana in Numidia 10,000, at Lambaesis 12,000, and 2,000 for the sevirate. The sum of 400,000, which a woman elected *flaminica* for life at Calama in Numidia promised for building a theatre, was quite exceptional. But the invariable custom was to exceed the minimum, or render additional services, e.g., give spectacles, feasts, or buildings. Thus, one Titus Flavius Justinus at Porto Torres in Sardinia paid for his election to the highest post (the *quinquennialitas*) 35,000, besides himself providing a tank, and the water to fill it. At Aeclanum the *quattuorviri*, by the decree of the city council, paid for their election, by making and paving a road through the cattle-market. At Lanuvium (Città Lavigna) the accumulated capital of the priests' entrance fees and other revenue, was by permission of Severus and Caracalla used to build *thermae*.

This municipal patriotism which made the cities exert themselves and vie, even beyond their means, in building, generally animated the prosperous citizens, who were also incited by the love of perpetual fame, of their name being handed down by inscriptions on great buildings, guaranteed imperishable by the law. But the ambition which is sated by civic office, panegyrics, wreaths, statues, seats of honour, was incentive enough to much generosity, and even to ruinous extravagance; and public opinion, which, in all the ancient Republics, expected and demanded of the rich great public services, drove many against their will to great sacrifices. In fact, in every city large or small throughout the Empire astonishingly great sums were always being given in voluntary contributions for communal purposes, and the buildings erected by private munificence often excelled the municipal ones in size and importance, and enabled the cities to retrench. The erection of public buildings by individual private munificence did not need imperial sanction, 'unless undertaken out of rivalry with another town, or unless they caused public disturbance, or were erected near a theatre or amphitheatre'. In literature and in provincial monuments, there are very numerous evidences of such buildings for general use on a princely or small scale, put up by wealthy individuals, such as temples, porticoes, theatres, amphitheatres, or bridges; or less opulent efforts, the paving of streets, the levelling of the public playgrounds,

the erection of sun-dials or booths in the market, or stone tables for goods, provision for proper weights and measures, etc. After Nerva's reign cities might receive legacies, and bequests for public buildings became common, or the heir might be obliged to build a bath, theatre, or *stadium*.

Some examples will show how frequently, and with what magnificent results, private individuals took part in the embellishment of their cities. After the destruction of Cremona in 69 A.D. the *fora* and temples were restored by private local munificence. At Como, the grandfather of Pliny the Younger's third wife built in his own name and that of his son a splendid colonnade, and gave the town a capital with which to adorn the gates. At Oretum in Tarraconensis a citizen 'at the request of the council and the burghers, and in honour of the Divine House (the Emperor's)' built a bridge costing 80,000 sesterces (£870) and gave circus games at the dedication. At Thagaste in Numidia, a Roman knight built a portico costing 300,000 sesterces (£3,267 10s.). Crinas the physician had walls built in his native city (Marseilles) and elsewhere for nearly 10,000,000 (£108,250); the two brothers Stertinius, physicians to Claudius, ruined themselves on buildings in Naples. The inscription on the pedestal of a statue of a citizen of Citium in Cyprus states that he built a new theatre and fitted it out entirely at his own expense. Dio of Prusa's grandfather exhausted his property in communal efforts, and Dio himself built a colonnade near the *thermae* in his native city with shops and workshops; the site alone cost him over 50,000 *drachmae* (over £1,850). Gaius Antius Aulus Julius Quadratus in 106 was proconsul of Asia, and, according to Aristides, was a divine agent sent to rejuvenate Pergamus to her present condition: 'if other families were born from the city, the city was born of him, as she acknowledged in council, in assembly, in the theatre, in fact, everywhere, since he had beautified everything'. Most of the inscriptions extant on public buildings in the cities of Pamphylia and Pisidia speak of private benefactors.

In the Greek provinces, the sophists, above all, who often earned immense wealth, used to devote a part of it to the architectural decoration of their native place or residence. Nicetes laid out great streets at Smyrna, and extended the city to the gate on the Ephesus road. Alexander of Cotyaeum, in the exaggerated expression of Aristides, made a new city of

Cotyaëum. Damianus of Ephesus, a pupil of Aristides and Hadrian, joined the temple of Diana at Ephesus with the city by a covered way one stadium long, to permit the devout to reach the temple rain-proof, and in the sanctuary he built a vast hall for sacrificial banquets, ornamented gorgeously with pavonazzetto. His descendants, too, were honoured there for 'their contempt of money'.

But Herodes Atticus (born at Marathon in 101, died in 177), one of the richest and noblest men of his time, and consul in 143, the principal sophist of his day, outdid all others in his unexampled and more than princely munificence. It was his ambition to acquire fame amongst his contemporaries by his oratory, and among posterity by his vast and splendid buildings for the common benefit; we possess considerable fragments of the latter, which are often alluded to; of the former nothing remains. In 125 Herodes was præfect of the free cities of Asia, when his father, Tiberius Claudius Atticus, enabled him to bestow a magnificent gift upon the city of Troas (Alexandria), by supplementing Hadrian's grant of three million drachmae for an aqueduct by the four million (over £150,000) still required. Later, Herodes' munificence extended to Italy; he gave an aqueduct to Canusium (Canosa di Puglia): but his principal care was Greece, Attica, and Athens above all, near which he passed his latter days, at Cephisia, which is still a summer resort. He subsidized cities in Euboea, the Peloponnese, and Boeotia, revived Oricum in Epirus, built a covered theatre in Corinth, and at Olympia an aqueduct with a *Nymphaeum*, a building with niches that overtopped the whole Altis; at Thermopylae he built sulphur baths, and decorated the stadium at Delphi with Pentelican marble. He even contemplated a canal through the isthmus of Corinth. In Attica he restored a temple of Athene in the deme of Myrrhinus: in Athens in four years he covered the panathenaic stadium of Lycurgus with Pentelican marble, built along one of the hills a temple of the Goddess of Fortune with an ivory image, and, at the foot of the Acropolis, in honour of his wife Regilla, an Odeum for 6,000 persons in cedar wood, which, according to Pausanias, beggared anything similar for size and splendour. It is now being excavated.

Thus the most generous of the rich did not restrict themselves to their native cities, though no one may have been

able to say like Herodes, when accused of the murder of Regilla (his prosecutor was boasting of munificence to an Italian city) : 'I could also say many things of the same kind about myself, if the whole world were my tribunal'.

It was the rule for municipals, on becoming senators, when their native citizenship lapsed, or on rising to high positions at Rome, or for Roman grandees, who were patrons of or otherwise connected with another city, to testify their benevolence or attachment to it by buildings or other gifts. Pliny the Younger by his will left Comum, his native city, a large legacy for the building and maintenance of *thermae*, and acknowledged the honour paid him by Tifernum Tiberinum, which elected him its patron in his youth, by building a temple, and giving a banquet at the dedication. Ummidia Quadratilla, a lady of high position, who owned a palace in Rome in the twelfth region, and died in 107 at the age of 80, came from Casinum; an inscription of four lines found there states that she built at her expense an amphitheatre and a temple for the inhabitants. Dasumius (probably the author of the *Senatus Consultum Dasumianum*, 101) had begun decorating Corduba, his native city, with public buildings, and by his will (made in 109) left the completion of the task to a commission of jurists and experts. One Dasumius Tullus (consul under Marcus Aurelius) completed at Tarquinii some *thermae*, for which his father, Publius Tullius Varro (consul under Trajan) had bequeathed the city 3,300,000 sesterces (£35,892 10s.), augmenting the capital and extending the building; the reason of this munificence must have been similar to the foregoing.

Imperial freedmen also often adorned their native homes with buildings. Cleander, the powerful freedman of Commodus, spent part of his immense fortune on houses, baths and other 'institutions of use both to individuals and cities'. Lastly, dependent or allied princes often showed their generosity and love of pomp by buildings even outside their dominions. Herod the Great filled Judaea with many splendid buildings, principally in honour of Augustus (the great port of Caesarea was the most magnificent), as also cities in Phoenicia, Syria, Asia Minor and Greece. Athens, Sparta, Nicopolis and Pergamus, according to Josephus, were full of his gifts; at Antioch he paved a dirty street 20 stadia long (2½ miles) with marble flags, and covered

it with a colonnade to keep off the rain. The later Herodeans also were great builders, especially Herodes Antipas, the founder of the new capital Tiberias.

One of the motives of this munificence in princes and Roman nobles was the example, or even command of the Emperors (such as was contained in Nerva's 'glorious speech'), who often purposely set the example by continually erecting fine public buildings, not only in Rome, but in Italy and the provinces, and contributing to new erections on the frequent occasions of inundations, conflagrations and earthquakes.

Probably, though seldom mentioned except in Rome, great fires did tremendous damage. In Nicomedia shortly before Pliny's arrival, a fire had raged: the municipality of this important city had no appliances for extinguishing fires. Pliny proposed the formation of a guild of 150 carpenters to act as a fire brigade, but Trajan would not sanction it, and only enjoined the procuring of the necessary implements, and called upon householders to act with the people in case of need. But even in cities where there were guilds of carpenters and mat-makers (the mats being soaked and used as extinguishers, like the sails of ships in the seventeenth and eighteenth centuries in Holland and Bremen), little was done; the fire brigade of 7,000 men at Rome was the best organized and largest, but of little avail against the incessant fires. And great fires were common outside Rome. In 57-58 Lyons was so completely destroyed by fire, that (in the exaggerated language of Seneca) it was useless to look for it; one night had annihilated this great city and its many splendid buildings, of which one alone would have been an ornament to any other city. It was only gradually rebuilt: in 65 Nero granted 4 million sesterces, the sum which Lyons had formerly offered on the occasion of the great fire at Rome. In 53 A.D. 10 million sesterces were granted for what must have been a great fire at Bologna.

Augustus, at the end of his own history of his reign, says that he has given countless gifts to cities in Italy and the provinces, destroyed by fire or earthquake. Other records confirm such grants of his in Naples, Paphos in Cyprus, Chios, and several cities in Asia Minor—Laodicea on the Lycus, Thyatira, and Tralles. Vespasian too 'restored many cities after fire or earthquake, so that they were more beautiful than before'. The remark of Tacitus that Laodicea, after

an earthquake in 60, repaired the damage without assistance from the State, shows that it was an exceptional case. At Puteoli there still exists a monument put up to Tiberius by fourteen cities of Asia Minor, more or less destroyed by earthquake (twelve in 17 A.D., and the two others in 23 and 29); he had generously contributed to the rebuilding. The *Chronicle of the World* by Eusebius records eleven earthquakes from the reign of Augustus to that of Commodus, ten of them in Greece and the East, but even for these countries the list is incomplete. The great earthquake is not mentioned, which, between 138 and 142, devastated Sicyon on the mainland of Greece, the islands Rhodes and Cos, and Lycia and Caria in Asia. Antoninus Pius had the cities restored on a magnificent scale; Stratonicea alone received 1,000,000 sesterces. Lesbos and the nearer islands and the coast opposite were especially liable to earthquakes: in 151-52 Mytilene was devastated and Asia Minor violently shaken. Of the earthquakes chronicled by Eusebius the most important were that of 115 (which completely overwhelmed Antioch for the third time), that of 122, which severely damaged Nicomedia and Nicaea, and that of 178, which shook all Ionia, and overwhelmed Smyrna. The imperial grants for restoration after 122 and 178 are expressly mentioned. In the West Campania 'was never secure from this curse'; in 63 (February 5) Pompeii was very severely damaged, Herculaneum somewhat less, and Naples and Nuceria to some extent.

But such restorations after earthquakes were but a small part of the building operations undertaken by all the emperors (except Tiberius) on a large scale in and outside Rome, with a view to the good of the cities, and also to the remunerative employment of large numbers of free labourers. But the Julian and Flavian emperors paid most regard to Italy, outside Rome; thus Claudius built a channel from the Lacus Fucinus, and the new harbour near Ostia (Portus), with huge moles and a lofty lighthouse; and Nero the harbour of Antium, and the lighthouses of Puteoli and Ravenna. Vespasian, apart from his large buildings in Rome, generally seems to have confined himself to restorations in Italy and the provinces, without, however (in Rome at least), having time to finish everything; and as in Titus' short reign another great fire devastated part of Rome, Domitian had space enough

there to satisfy his infatuation for building: he also had some roads made in Italy.

Trajan immediately after his accession commenced his great building projects in Rome, which almost surpassed all previous undertakings; in his later years they were so extensive that there were hardly artisans enough in Rome and the neighbourhood; he also provided for all Italy on the largest scale, laid out roads, harbours, waterworks, and also carried out important works in the provinces, not reckoning the establishment of new colonies and cities; the greatest of these, according to Dio, was the bridge over the Danube (on 20 pillars and 1,017 metres long). After the removal of the bridge the pillars still standing seemed to him to show that there was nothing impossible to man.

Hadrian's first act of administration was a remission of taxes amounting to 900 million sesterces (over £9,750,000), and his buildings give an idea of the inexhaustible resources of the Roman Empire and of the indefatigability of the man. He decorated Rome with splendid buildings, restored from 125-130 the Pantheon which was burnt down in 110, created for himself a fairy residence of architectural splendour in his villa at Tibur, and, on his journeys through the whole of the Empire (121-134) was accompanied by a regular army of architects, masons, artists and artisans, divided in military fashion into cohorts to carry out his inexhaustible schemes with the aid of native workmen. Thus he founded new cities like Pons Aelius on the Pictish Wall, Hadrianotherae in Moesia, Hadrianopolis in Thrace, Aelia Capitolina on the ruins of Jerusalem and Antinoöpolis in Egypt.

Of the buildings, with which Hadrian is said by his biographer to have decorated all the cities he visited, only a few are known of in the Northern and Western provinces, e.g., a temple of Augustus at Tarraco, a basilica in honour of Plotina at Nemausus, an aqueduct at Sarmizegetusa, one of the 'countless' ones that bore his name. A few examples may be given out of the long list of his buildings, yet traceable, in the East and Greece, where nearly every town could point to his boons, and many rightly hailed him their Deliverer and Founder, or, like Palmyra and Petra in Arabia, named themselves after him.

On the Isthmus there is a dangerous mountain path on the

Scirionian cliffs ; Hadrian at enormous effort cut the rocks and underpinned strongly, and made a long and convenient road for heavy carts, some 6,000 feet long, a feat now almost unimaginable at this spot ; from the high valley of Stymphalus he constructed a mighty aqueduct to convey an abundant supply of cool mountain water to Corinth, which he decorated with splendid *thermae*. But, above all, he rejuvenated Athens, created a new Hadrianopolis in the south-east of the city, centreing round the colossal temple of Olympian Zeus, which had remained unfinished for 600 years ; in it were 104 Corinthian columns 60 feet high, in three rows in front and two rows on the sides, of which fifteen are yet standing. In the other part of Athens he built a library with 120 columns and walls of Phrygian marble (*pavonazzetto*), in which the rooms glittered with alabaster, gilded soffits, pictures and statues, and a gymnasium with 100 columns of Libyan marble (*giallo antico*). He commenced an aqueduct from Cephisia for the new part of Athens, completed in 140 by Antoninus Pius, who also embellished the health-resort at Epidaurus and restored important buildings in Rome and Italy, e.g., the lighthouse at Portus and the harbours at Terracina and Puteoli, and built new ones—the harbour at Caieta, a bath at Ostia, an aqueduct at Antium, and temples at Lanuvium. He also subsidized several cities, enabling them to restore and build anew, and, after the earthquake of 138–142 rebuilt the districts ; he also built in Syria and Carthage. Septimius Severus crected many splendid buildings in several cities. Of the later emperors, according to hostile Christian evidence, Diocletian was possessed of an infatuation for building, which sorely taxed the provinces. ‘ Here basilicas arose and there a circus, here a mint and there an armoury, here a palace for his consort and there one for his daughter. Often quarters of a town and their inhabitants had to be cleared out, as though it had been occupied by an enemy, to make room for new buildings. And when these buildings were finished, to the ruin of entire provinces, he disapproved, and ordered them to be started afresh on a new plan ’. But, as a fact, this passion was strictly for State purposes. Everywhere, at his behest, monumental buildings arose at Alexandria, Antioch, Palmyra, Milan, and Carthage. His *thermae* at Rome surpassed those of Caracalla. Justinian was a legitimate descendant of the

Roman emperors in his love of building, and Procopius dedicates three books to this subject.

The above account will give an idea how magnificently the emperors provided for architecture in the Italian towns, and, after Trajan, in the provinces as well. But owing to the scanty and accidental notices and remains, it is difficult to estimate, even approximately, the extent of the imperial buildings outside Rome. For example, Aristides, in a letter requesting Marcus Aurelius and Commodus to restore Smyrna after the earthquake of 178, incidentally touches on the care shown by them for the Italian cities, which they had rescued from decay; and, in the biography of Marcus Aurelius, it is said 'he afforded help to tottering cities'. The gorgeous public buildings lavished on Rome by the emperors, need no specific mention here.

During the first two centuries architecture, though used for public buildings to a vast extent, must also have been called into requisition for private purposes yet more, and to a greater degree than at any other epoch, for private prosperity was greater and more widely spread, and this particular art was more in vogue and accordance with the tendencies of the age than any other. Of the splendour of the palaces and villas in Italy mention has been made. But the greatness of luxury in provincial private residences is shown by some literary notices, and by the well preserved remains of villas on the Orontes, as well as by those of Damianus near Ephesus. One of the many villas of Herodes Atticus at Cephisia (north-east of Athens) had tasteful, richly furnished and well-lighted baths, and long pleasant walks, and in the greatest heat the house and the park afforded shade, and brooks and birds could everywhere be heard. The interior decoration was lavish, for Herodes, after the death of his consort Regilla, had his rooms painted black and decorated with black curtains, black carpets, and black marble. The suburban villa of the Laberii at Uthina (near Tunis) contained 67 mosaic floorings with figures on them. A mosaic found near Constantine represents a castle, of large extent and several floors, and flanking towers, and the owner hunting on horseback, and on another is his stable with the names of the horses. A mosaic found near Hadrametum (Suza) represents the lady of the house fanning herself under a palm; a servant is holding up a sun-

shade, and she has a dog in leash. In the magnificent villas and gardens of Carthage the Vandals luxuriated as much as the former owners. For the fifth and sixth centuries we have pictures of life on the pleasant country estates, on the Garonne with its numerous amusements, such as falconry and trips on gondolas with lofty balustrades, pillows and awnings, and games with dice artistically worked in mosaics. Ausonius was reminded on these banks of the similar banks of the Moselle clad with vines and lined with villas; and numerous finds here and on the Saar prove that the entire region, including parts of the Eiffel, even now deserted, abounded in Roman residences of great size, and richly furnished with mosaic floors and sculpture (e.g., the villas at Nennig near Trèves and Kreuznach, and at Welschbillig), with columned halls affording an open view. In the *Zehntland* (*agri decumates*) the villas, as is shown by the remains, had baths and aqueducts, with marble ornaments, sculptures, mosaics and bronzes. From the excavations in the Rhineland and Switzerland, even on the frontiers, it seems the rich always had mosaics and wall-paintings. Even in Eastern Switzerland, which was never fully Romanized, where Roman settlements are scattered, both are found, though somewhat insipid. Britain too, had in time, as the remains (mosaics especially) show, in the centre and the south as many richly decorated villas as any other province of the empire. Even temporary residences were decorated to suit the decadent taste. Hadrian had to restore discipline in the German armies and ordered all banqueting-halls, colonnades, crypts and gardens to be cleared away from the camps.

§ 2. AIMS AND APPLICATION OF THE PLASTIC ARTS AND PAINTING.

(a) *Decorative Art*

The vast scope afforded to architecture employed all the plastic arts in interior and external decoration. Nowhere, least of all at Rome, was an important public building erected, without the chiseller, the stucco-worker, the carver, the founder, the painter and mosaic maker being called in. Statues, single or in groups, filled gables, roofs, niches, interstices of columns, staircases in the temples, theatres, amphitheatres, basilicas, *thermae*, bridges, arches, portals and viaducts: the

temple of Scaurus contained 3,000 bronze statues. Triumphal arches generally had at their summits equestrian figures, trophies, chariots of four or six horses, driven by figures of Victory. Reliefs and medallions bedecked the frieze, and reliefs or paintings the walls; ceilings were gay with stucco or coloured work, and the floors with glittering mosaics. All the architectural framework, supports, thresholds, lintels, mouldings, windows, and even gutters were overloaded with decorative figures.

It is difficult to imagine the almost magically rapid growth of public buildings at Rome during the first centuries. These incessant undertakings in themselves sufficed to give continuous employment to hosts of artists and artisans, besides the architects and workmen. Agrippa, in his aedileship (33 B.C.) laid out magnificent waterworks for Rome; in one year, according to Pliny, 700 basins, 500 fountains, and 130 *castella* (reservoirs), many of them highly ornate, and used for decorative purposes, 400 marble columns and 300 statues of bronze and marble. Later outlay was not less lavish: Claudius conducted the water of his aqueducts 'through many decorated basins'. The basin of Orpheus in the fifth region, and of Ganymede in the seventh, were doubtless named after statues. Domitian was ridiculed for the number of large arcades and triumphal arches with chariots and triumphal insignia that he set up throughout Rome. The triumphal gate described by Martial illustrates the scale of these buildings: this gate was erected in January, 93, after Domitian's return from the Sarmatian War. Medallions decorated the spaces above the arches, bas-reliefs or round sculptures the entablature and the upper parts: two *quadrigae* of elephants, both driven by colossal statues of the Emperor, crowned the building. Representations on coins indicate the splendour of the Forum of Trajan, which outdid all the rest; its several parts (the Basilica Ulpia, the Triumphal Arch, and the Temple put up to him by Hadrian), were richly decorated and carved, and considerable remains were excavated by Napoleon I.

Public places in Rome and other cities were equally well provided with plastic ornaments, chiefly statues. The vast number of these in the cities of Greece and Asia was only partly affected by the systematic plundering of two centuries: the Romans had almost emptied the *ἀγοραί* of small places like Andros and Myconus, to fill the temples and *fora* of Rome.

One most extensive pillage took place under Nero : his agent, the freedman Acratus, ' traversed the whole world, not passing by a single village '. Apparently Acratus, like other art-pillagers, spared Rhodes alone ; for, according to official lists under Vespasian, there were 3,000 statues there, though those at Athens, Olympia and Delphi were equally numerous : hence to compute 10,000-20,000 for Greece and the islands at this time would be too low an estimate. But even two and a half centuries later, when Constantinople was being embellished, these ancient remains were not exhausted. The officials of the chancery of Constantius found ' in the ancient cities ' enough to pilfer, and ' marvels of art which had defied time were transported by sea to make fullers' houses more gorgeous than palaces of old '. Yet it has been left for our age to estimate the wealth of the Hellenic countries in works of art, which survived the plunder of antiquity and the Middle Ages, by the discovery of the sculptures of Phidias, the Venus of Milo, the Hermes of Praxiteles, and the ruins of the altar of Zeus at Pergamus.

Much of ancient sculpture decorated the public buildings, or stood as votive offerings in the Temples : but enough was left to fill the streets and squares with ancient or modern figures in bronze or marble of gods, heroes, public servants, and famous men and women : how, during the first century, any gaps in the list were repaired, and the stock increased, will be shown later.

In the beginning of the Empire the statuary of Italy (outside Rome) and the Western provinces, though considerable, could not compare with the collections in the Greek provinces, since the Alexandrian epoch. But, even in the later Republic, these cities were not deficient in such decoration. Vitruvius says that the excellence of the stone quarried near Tarquinii (on the Lake of Bolsena) was attested by the statues at Ferentinum (in Etruria), where there were large statues, well carved, small figures (probably reliefs) and delicate ornamentations in flowers and acanthus work, made of this stone, and preserving an appearance of newness. Many of the newer statues in many Italian cities were no doubt those of the victorious kings and generals of Rome, probably the same as those selected by Augustus in 2 B.C. for the colonnades of the Temple of Mars in his forum. At Arezzo seven pedestals have been found of

statues of Marcus Valerius Maximus, Appius Claudius Cæcus, Quintus Fabius Maximus, Lucius Aemilius Paullus, Tiberius Sempronius Gracchus, Gaius Marius and Lucius Licinius Lucullus ; at Pompeii two (Aeneas and Romulus) ; at Lavinium one of Aeneas Silvius, the son of Aeneas and Lavinia ; possibly the Marius found at Otricoli and seen by Plutarch at Ravenna, was part of the same series.

Generally every city aimed at a decoration of the public places with statues, and the *fora* in all the larger towns were colonnaded and thus decked, e.g., the forum at Arles as late as the fifth century. At Cirta (Constantine) traffic in the forum was obstructed by the number of statues, erected by ambition or the civic spirit, which could not afford public buildings. Statues were also accepted as the entrance-money of priests and officials, and testamentary provision was made for their restoration. A provincial priest in Bætica had held the highest priesthoods and city offices at Corduba, and, in recognition of the honour, had statues worth 400,000 sesterces put up (£4,350), probably to the number of 40-130. Statues intended for public places would be mostly of gods and emperors. Representations of the *lares* or of the *genius* of the city will generally have been included, especially as in the Roman forum there stood the *Genius* of the Roman people (a statue in gold, or gilded bronze after Aurelian's reign). In the West, too, the increasing expenditure on personal statues contributed to the number in the public places of the cities.

But plastic art was employed for the adornment of private houses even more than for public buildings, and was indispensable in palaces, villas, parks and gardens. Even in Sulla's time, pictures and statues were as much part of the furniture of a rich house as carpets and silver plate, and so too in the large country houses. Only exceptionally were there none : e.g., in Seius' house at Ostia, and in Augustus' villas, where antiques and natural curiosities replaced them. Cicero bought works of art through Atticus for his so-called Academy at his Tusculan villa. He offered 20,400 sesterces (about £180) for some Megarian statues ; Atticus also bought for him *hermeracles* of Pentelic marble with bronze heads and a *hermathena* ; and Cicero asked him to get him as many suitable objects of art as he could, especially reliefs which he might fit into the stucco of his little *atrium*, and two embossed and

decorated well covers. All he bought of Atticus was for his Tusculan villa ; his villa at Caieta he intended to furnish, as soon as he could afford it. But with some four or five statues (including Bacchantes and a Silenus), which Fadius Gallus had bought for him, he was displeased, as too dear, and not in style with his academy. He had had new couches put in a colonnade and wanted them ornamented with paintings ; for, above all, he loved paintings. In this Cicero, with his poor taste and little love of art, strikingly illustrates the fashion of decorating houses and country-seats artistically.

Under the Empire the fashion spread. If a rich man's house were burnt down, the friends who contributed to the rebuilding gave 'nude marble statues', famous bronzes, old ornaments from temples in Asia Minor, and busts of Minerva for the library. The baths of freedmen abounded in statues. Villas and gardens were filled with them and people spoke of 'marble gardens'. Round one spring in the garden of Arruntius Stella stood a troop of marble figures of boys, in a grotto close by these was a Hercules : and the rest was on the same scale. Domitius Tullus, a rich man, had such a stock of neglected masterpieces that he could fill a large park, on the very day of purchase, with numerous ancient statues. Silius Italicus owned several villas, each with a multitude of pictures and statues. In the gardens of Regulus in Trastevere, one huge space was filled with colonnades, and the bank lined with statues of himself. We may take the decorations of houses and gardens at Pompeii as typical of Italian cities. In 1894-5 the house of the Vettii was excavated, and 192 pictures were found on the walls : the many statues in the garden, now restored, are almost all perfect ; of twelve statuettes, which spouted water into a marble basin, nine are preserved, and other sculpture in the garden as well.

If excavations in previous centuries had been more accurately recorded, we might have had as exact a picture of many Roman villas, as the old sketches of the so-called villa of the Epicurean philosopher at Herculaneum. It contained a large courtyard with a long road with semi-circular ends, and a garden round it ; the whole space was covered with columns, which carried beams up to the garden wall, creating an arbour all round. In the arbour there were special places for washing and bathing, semi-circular and square alternately ; in every

corner there stood a marble *terminus* with a bronze bust, and in between the columns *hermae* (heads of Romans and busts of gods, Greek poets and philosophers, portraits real or fictitious) and bronzes of females in alternation. In front of each herm was a little basin, with a little column, with a sort of shell decoration rising out of a shell-like vessel at the bottom, and spouting up water. Round another small pond was a group of boys, satyrs and *sileni*, as powers of water, and in the centre Silenus riding on a leather bottle. A long walk led out of the garden to a raised, round *loggia*, probably set in the sea, with a round floor of mosaics in *africano* and *giallo*. The ten beautiful statues of Apollo and the Muses, which were afterwards completed and placed in the museum at Sans-souci as Achilles with the daughters of Lycomedes, were found in 1729 in the ruins of the so-called villa of Marius at Frascati. The present collection of Azara at Madrid, of at least thirty busts, comes almost entirely from the so-called villa of the Pisos excavated by Azara at Tivoli in 1779.

All such places were excelled by Hadrian's villa at Tivoli in abundance and extent: it was an art-world in itself. Its inexhaustible ruins have enriched the Vatican, the Farnesina, the villas of the d'Este family, the Capitoline Museum and the Villa Albani. As early as Alexander VI, excavations on the site had begun. But the excavations of Cardinal Ippolito d'Este, under the superintendence of Pirro Ligorio (1530-1586), the architect of the Villa d'Este at Tivoli, yielded but little of the spoil. In the eighteenth century excavations proceeded on a larger scale and under men with an eye to trade in antiques, and great finds were made: Benedict XIV incorporated many of them, especially the Neo-Egyptian statues of the shrine of Canopus or Serapis, in the Capitoline Museum.

Ancient painting and sculpture were also largely used in decoration, e.g., in the park of Domitius Tullus and Vespasian's Temple of Peace. But this was not always possible, and even the most boundless plunder from Greek countries could not satisfy the enormous demand, augmented as it was by the constant huge fires in Rome, and, even in the first century, fresh gaps involved fresh production in man. Hence the greater part of the demand for art must have been supplied by new work, all the more as in many cases work referring to the present was required.

Ancient decorative art was then not only employed on a far larger scale than at any later time, but also far more generally in all branches, subserving all needs and tastes, the highest and lowest, the greatest extravagance and modesty, the Sultan's moods of the lords of the world, or beautifying the poor slave's cell. Modern art has always been more or less aristocratic, serving a small privileged set, the church, the plutocracy, and the mighty, sometimes in particular circumstances bringing beauty into middle class, but never into lower class, life. Art has dwelt in great centres of national life, the capital and the palace, and embellishing these, has left whole provinces and lands bare. Correspondingly, appreciation of art has become restricted to smaller circles, and has implied an education and power of abstraction non-existent in the masses. But the art of the Roman Empire was pregnant for all grades of culture and society and spread taste for most of her productions in far wider circles. It created furniture finely conceived and expertly made for connoisseurs to enjoy, and filled temples and public places with comprehensible figures, high walls and floors with gay pictures, which fascinated even the man in the street. Art made the capital of the world a city of marvel and conferred on the *municipia* and colonies of Italy decorations, differing according to local taste and prosperity, but far above modern ornament, and by no means confined to public buildings. The excavation of Pompeii and Herculaneum has revealed to wondering modernity the quality and quantity of private ornamentation, plastic and pictorial, even in the smaller cities of the empire, and its estimation as a prime necessity even in modest households.

Costly materials, bronze and marble figures, could only be used by the rich for their houses and gardens, but were luxuries common not merely in Rome. At Pompeii and Herculaneum spring-water ran out of holes and bottles held by marble or bronze satyrs, *sileni* and nymphs. But the large demand for artistic work in the middle and lower classes produced a large production in cheaper material, clay and stucco. Stucco relief and decorations, painted or unpainted, on mouldings and ceilings were common in houses, as Pliny says and excavations have shown. Plastic busts adorned the rooms, the studies and libraries of such as could not afford marble; in Martial's and Juvenal's time all the mock-stoics and philosophizers had

plaster busts of Democritus, Zeno, Plato and others, with scrubby beards. Architectural decorations in clay, on columns, windows, mouldings, and gullets and friezes for inside and outside walls, have been numerous preserved; they are often painted in one colour, or the natural colours of the object represented; and these trifling articles of manufacture reproduce the greatest discoveries and noblest forms of the great period of Greek art.

Besides plastic art in soft materials, frequently in combination with it, painting was still more common for interior decoration, when incrustation in marble would be too costly: and colours always went with stucco. At Pompeii the better class house glittered with bright decorations lightly chiselled here and there, but often very beautiful; numerous references and ruins show that such interior wall-decoration was as widely spread as Roman civilization through the Empire. The discoveries at Pompeii and Herculaneum utterly transformed our notions of ancient painting, and yet are but an inconsiderable fraction of the pictorial art of the Empire, and only illustrate part of the subjects and material of ancient decoration. Mythology supplied most of the subjects at all times: the fight by the ships before Troy is mentioned as a common theme. But historical scenes were also depicted, e.g. the Esquiline pictures of scenes from the legendary foundation of Rome, the description by Apollinaris Sidonius of the villa of Pontius Leontius, Burgus, which contained scenes from Jewish history, and events in the third Mithridatic Wars, e.g., Mithridates sacrificing horses to the sea-god, the siege of Cyzicus, and Lucullus relieving the town (with a soldier swimming through the sea and holding up a letter). In Greece, a man who had never seen a battle was said not even to have seen one on a wall-painting; but battle scenes must have been common elsewhere as well. Phaedrus says that comic pictures of animal life were also usual: in his time (the reign of Tiberius) the *tabernae* used to have pictures of the War of the Mice and the Weasels.

With the other decorative arts, wall-paintings were common down to the last days of the Empire. In Diocletian's tariff of 301 A.D., in which the maximum wage for all ordinary work is fixed, the following are the house-decorators mentioned: marble-workers (for incrustations and ornaments), mosaic-

workers, whitewashers, wall-painters, picture-painters ; prices for bronze-foundries in reliefs and statues, and for modellings in stucco and clay are fixed. In a rescript of Constantine (337 A.D.) to the administrator of the Western Provinces on the immunity of artists and craftsmen from communal burdens, the same workmen are specified, and must therefore still have been settled in those towns. Valentinian gave painters yet larger privileges, if free-born, by a rescript to the legate of Africa in 374 A.D. They were to have workshops in the city free of rent, were allowed to settle in every city, and were not to be compelled by officials to execute 'sacred' portraits (of the emperors) or paint public buildings gratuitously. Stone sculpture for decorative purposes lasted on to the end of the Empire, for the early report of the Martyrdom of the Five Masons under Diocletian was written by a man personally acquainted with the quarries of Pannonia, the scene of the story. The Emperor used to order porphyry pillars with foliate capitals, basins shaped like *conchae*, and bowls (*lacus*) decked with fruits, or acanthus, or embossed figures, *victoriae*, Cupids, lions that spouted water, eagles, stags, and other animals, all as ornaments for marble well-covers and basins : a proof of the extensive use of stone in architectural ornament.

In plastic art and in wall-paintings, down to the last, even if the scene was contemporary, ancient models were followed. In the Imperial Palace of Milan there was a picture of the Caesars seated on their thrones, with Scythian chiefs kneeling : in 452 Attila had it altered, so as to give the Caesars the suppliant posture. In the banqueting-hall of the Imperial Palace at Aquileia was a picture of Constantine and Fausta as children ; Fausta is handing her brother a helmet decorated with gold and jewels, and a waving plume. Ausonius, who wrote an epigram on a picture representing Gratian laying low a lion with a single shot from a bow, says that mythological scenes were even then common : he describes a wall-painting in Aeolus' house at Trèves ; heroines, whom love has ruined, torturing and binding Cupid. Libanius speaks of pictures of the divine amours, and describes two landscapes in the Pompeian manner : one with country buildings, men, animals, a two-wheeled laden ox-cart, and a temple with trees ; the other with a wreathed festive company under an awning amongst the trees, and a city with walls and turrets in the background. Apollinaris

Sidonius (Bishop of Clermont *c.* 450 A.D.) hates heathen art for its themes and its nudity, and had the walls of his bathroom on his country estate simply whitewashed: 'here no pictures are to be seen of bodies ugly in their naked beauty, such as, under the pretence of honouring art, dishonour the artist; no comedians with ridiculous grimaces and harlequin garb, no wrestlers in close grip'. Luxorius wrote under Thrasamund the king of the Vandals (496-523) in Africa, and describes pictures no doubt common, e.g., Fridamal killing a boar, Romulus killing Remus on the wall of Rome, Diogenes with his beard twitched by a girl. And Christian art, too, had to adopt some of the traditional themes and forms. Painting was early recognized as of importance to the Church. Paulinus of Nola (403) says that the pictures of the Old and New Testaments and the Martyrs in a colonnade near the Basilica of St. Peter at Nola entertained the many pilgrims who could not read, and kept their thoughts from the flesh. Gregory the Great declared pictures to be books for the unlearned.

Mosaics were more durable, and many more remains of them have come down to us in all the provinces (e.g., Spain, France, England, Switzerland, the Rhine-lands, Bavaria, Salzburg, Transylvania, North Africa, where hundreds have been found) than of the wall-paintings; this style of decoration survived the Empire, and must have been very common indeed.

Household furniture manifests the same generality of taste as the homes. At Pompeii alone, whence the refugees must have carried away a great deal, or subsequently dug up much out of the loose ash, the tables, benches, armchairs, sofas, candelabra, vessels, lamps, tripods, toilette utensils and other ornaments, have given modern craft an inexhaustible set of tasteful models. It was not only marble and bronze candelabra that were decked with fantastic plant-like designs, or only vessels of silver and gold that had chased work and graceful handles, or glass vases with figures in various colours in relief; the poor man's earthenware, his paste seal rings, the clay lamps for midnight work, and their covers especially have handed down their wealth of design and figure. Juvenal describes the home of a destitute scholar or poet: a short bed and an old chest with divine Greek poems, which barbarous mice gnawed, a marble table-top, with six little jugs, a tankard (*cantharus*, with vertical handles), and the figure of a

centaur recumbent as support. *Sigilla* (little statues) as ornaments were always welcome presents, and regularly exchanged at the *Saturnalia*; at Rome they were bought in a special market on the slope of the street named after them, *sigillaria*. Amongst the *Saturnalia* gifts for which Martial has written inscriptions are: clay-figures (Brutus' favourite boy, Hercules, a hunchback); marble figures (a hermaphrodite, Leander); Corinthian bronzes (Hercules, Apollo the lizard-slayer); silver (Minerva); gold (Victoria); and two pictures (Hyacinthus and Danaë). Works of art were usual gifts; Horace apologizes for not being able to give a Scopas or Parrhasius; Seneca commends durable gifts, silver rather than gold, statues rather than clothes and carpets; in Martial's time one busy lawyer looked to receiving on his birthday from his clients works of Phidias.

But the tombstones show most clearly to what an extent art was at the service of the poorest. Sarcophagi with splendid reliefs, were purchasable only by the rich, though much cheaper than nowadays; but, at any rate in the first century, cremation was the rule (in the Streets of the Tombs at Pompeii there is not a single sarcophagus) and burial only came into fashion again about 100 A.D., and gradually became more and more common. Those little marble urns, often strikingly beautiful, with life-like figures 'in which the ashes in their narrow domain still seem to live', mostly came from small workshops, and were purchasable by those of small means. Painting, too, always decorated the interior of tombs, as is shown by the retention of the custom in Christian vaults, and often too the outer walls; even the 'whitewashed' graves of the Evangelist were partly painted. Even the *Columbaria* (large vaults with long rows of niches for cinerary urns), the resting-places of the poor, of slaves and the hapless, sometimes have walls as bright as those of ordinary rooms, the decorations (often poor) covering the unused spaces on the pillars and walls. When a new urn was inserted in the niche that had been bought for it, the mourners looked with satisfaction at the little ornaments, bought out of their savings for the dead. The subjects might be mythological, pictures of daily life, scenery, animals, fruit, flowers; such as Hercules shooting the vulture from Prometheus' liver, Ulysses gazing down on his dying dog Argos, grotesque pygmies fleeing before

a crocodile, jugglers dancing a castagnette dance, a giraffe with a bell round its neck, led by its keeper, as in the amphitheatre, and so on.

(b) *Monumental Art*

Sculpture and painting thus found boundless scope in decoration, and, besides this, also in monumental works, intended to immortalize persons and events, on a scale unparalleled during the first two centuries, and enormous even in the third and fourth.

As always, art was the means and not the end with the Romans. Art as applied to make home and city more beautiful, splendid and comfortable, they only learned after the conquest of Greece; but, as a means of recording events and the figures of great personages for contemporaries and posterity, the use of art was congenial to the national temper, as is shown by the ancient custom of noble families, who kept painted wax masks of their ancestors. Public statues go back as far as the Decemvirs (304 B.C.); the oldest one of any certainty is that of the Greek interpreter on the Forum; this, as all that we know of during the two next centuries, was in bronze (first used for sacred images after 269 B.C.); the first statue in gilded bronze was that of Acilius Glabrio, the conqueror of Antiochus, erected by his son in the Temple of Pietas (181 B.C.). About 300 B.C., statues were erected of the kings and famous men of the Early Republic. After the second Punic War the Capitol and Forum were full of statues. In 179 B.C. some of these were removed; in 158 B.C. the censors had all statues of officials cleared away, which were not erected by a decree of the people or the Senate. Cato preferred that it should be asked why he had no statue, rather than why he had one; he complained that statues were erected to women in the provinces, a custom which soon spread to Rome. The statue of Cornelia, the mother of the Gracchi, put up at this time, was seen by Pliny in the *porticus* of Octavia; its base, injured in a fire, and afterwards used for a statue of Tisicrates, has recently been discovered.

The custom of informing the people of great events by pictures is also early. Manius Valerius Maximus Messalla painted his sea victory over the Carthaginians and Hiero in Sicily (264 B.C.) on a wall in the Curia Hostilia. Such pictures on wood and linen used to be carried along in triumphal pro-

cessions, e.g., in that of Marcus Marcellus (212 B.C.) a picture of the capture of Syracuse. Aemilius Paullus in 168 sent for a painter from Athens to illustrate his triumph. Lucius Hostilius Mancinus took an outwork of Carthage in 148 and had pictures of the city, its siege and storming, placed in the forum, which he himself explained to the people; this made him popular, and gained him the consulate in 141. Tiberius Gracchus had a banquet painted in the Temple of Freedom, which the Beneventines had given his army in 214 after a victory near by. The slaves enrolled and manumitted for bravery could be seen with the token of liberty. A picture of a gladiatorial combat was first exhibited in the sixth or seventh century by Lucius Terentius Lucanus in the Temple of Diana at Aricia.

Under the Empire the use of art in celebration of persons and events, temporarily and permanently, extended greatly. In the fact 'of the prominence of the principle of description', 'in the broadly illustrative tone', painting then was much more like the ancient Egyptian and later Old Assyrian, more like the paintings in the Theban palaces, the alabaster tablets of Nineveh or the Babylonian tapestries. By such means the Roman emperors addressed their people; pictures replaced manifestoes and proclamations; we may compare the historical and allegorical pictures in medieval Florence and Rome, such as Cola di Rienzi's, with which the people were stirred to passion. Every triumph employed a host of artists, who visualized the conquered country and the campaign for the spectators; often, or perhaps generally, artists' sketches were given to the army for this purpose. At the Judæan triumph of Vespasian and Titus scaffoldings three or four storeys high were hung with gold-embroidered tapestries, and ornaments of gold and ivory; on these pictures and on others the whole course of the war was depicted. 'A rich country was seen being devastated, whole hosts of the foe fleeing, falling or surrendering, huge walls collapsing under the blows of battering engines; strong fortresses being stormed, the round walls of populous towns being mounted, the army pouring in and spreading murder, and the defenceless begging for mercy, temples being fired, houses collapsing over their inmates' heads, and, after much misery, streams of water, not feeding the fields or assuaging thirst, pouring through the burning streets'. Thus too Don Juan of Austria, at his entry into

Brussels (May 1, 1571), sent banners in advance, depicting the Battle of Lepanto and other great scenes of his life. In antiquity the plastic arts were also used in triumphs; figures of mountains, rivers, countries and cities personified after the ancient fashion. To this day on one relief of the Arch of Titus one can see the recumbent statue of the Jordan carried at the Judæan triumph; so too colossal figures of the Rhine probably formed part of German triumphs. In Octavian's triumph after Actium a picture of Cleopatra with the asp in her arms formed part of the procession.

The artistic pyres, erected, after Asiatic models, at the consecration of deceased emperors on the Campus Martius, consisted of pyramids tapering upwards in storeys, and at the top the bier; they were covered all over with gold-embroidered cloths, ivory reliefs and pictures, no doubt of scenes in the deified ruler's life. As soon as this mass of splendour was lit up in barbaric fashion and burst into flames, an eagle soared aloft from the gable of the tabernacle at the topmost story.

But the clearest evidence of the use of painting to visualize the events of the moment is afforded by the law-courts. Even in the later Republic accusations were supported, at any rate in the popular assemblies, by pictures of alleged or actual crimes. Aulus Gabinius the Tribune in 67 B.C. produced and descanted on a picture of the Tusculan villa of Lucullus, to convince the people of the consular's luxury. When Galba in 68 at Cartagena was inciting his troops to march against Rome, he exhibited in front of his tribunal as many portraits as possible of Nero's victims, as dumb witnesses to his tyranny. A defendant, who was depicted by his opponent on the *sciparium* (screen over the judges' seats) in various attitudes, as a hopeless actor, stripped to his shirt, in prison for debt, or being ransomed by his friends, said to the judges: 'And yet I have won several times'. Quintilian had sometimes seen judges prejudiced against defendants by horrible pictures on wood or canvas. He disapproved the device, as the accuser vitiated his own case and made a dumb picture seem more eloquent than himself.

So too there were pictorial begging-letters. Shipwrecked men, genuine or impostors, used regularly to carry pictures of themselves swimming to land from a wreck on a deep blue sea; such pictures were offered up as votive tablets in the temples,

especially in those of Isis, the patroness of shipping ; ' every one knows ', says Juvenal, ' that painters live on Isis '. We may mention, in passing, these countless ex-votos in pictures or reliefs, representing the danger escaped as accurately as might be ; mostly, like the last-mentioned, executed by second-rate artists, but, no doubt, occasionally by skilful artists for richer men. Tacitus mentions that Domitian was in great peril when the Capitol was stormed in the night of December 18, 69, and erected on the site of a Temple servant's house, in which he had concealed himself, a chapel to Jupiter the Saviour, with an altar with his adventure engraved in marble.

This representation of personal events in pictures and sculpture must have been common. Pasitales portrayed in a silver relief how the nurse of the great actor Roscius once found her charge sleeping with a snake coiled round him. In Apuleius' romance, the bride who, by the aid of an ass, has escaped the robbers, wishes to set up a commemorative picture in her family *atrium*. In Trimalchio's house, walls in the colonnade are painted with scenes from the Iliad and the Odyssey, a gladiatorial show, and the master's career in a style partly allegorical, as a boy in the slave-market, as Mercury's darling with the *caduceus* in his hand, brought to Rome by Minerva, pictures in which he is being taught to reckon up, becomes a steward, etc., all with letterpress ; in the last scene he is being lifted by Mercury on to a lofty tribune, with a Fortuna bearing the *cornu copiae* (horn of plenty) and the three *Parcae* twisting golden threads. This novel describes the social customs in certain circles, and such bad taste may have been instanced in life. Trimalchio orders his own tomb ; it is to contain in minutest detail the history of his life ; a feast he gave to the whole commune, with himself sitting on a raised tribune, in a toga with purple fringe, with five golden rings on his fingers, flinging gold coins amongst the rabble, and tables all around at which the good folk of the commune are gorging. An actual tomb with similar portrayals has been preserved, that of a *sevir* of the *Augustales* at Brescia. The lofty obelisk-like tombs near the Meuse and the Moselle (e.g., that of the Secundinii at Igel) have carvings of the family life of the deceased all round ; the master returning home on horseback from the chase, the wife in the dressing-room, tended by her slaves ; merchants in the office at the counter, in the warehouse

at the scales ; coopers in the cellar ; a sale of fruit ; landlords receiving from their farmers sheep, fish, game and eggs ; a boat loaded with casks, etc. ' In this beautiful country 1,500 years ago peaceful activity, pleasure and genial life flourished apace '.

But not only real events, even dreams of significance were eternized in art. Herodian had seen in the Roman forum a picture of one of the most important dreams, which promised the Empire to Severus, executed on a large scale in bronze. Severus had dreamed he saw Pertinax riding in the Via Sacra on a royally caparisoned horse ; but, as soon as he reached the entry of the *forum*, the horse threw Pertinax off and lifted up Severus, and stood with him on his back in the middle of the Forum. Cassius Dio saw at Mallos (in Cilicia) a picture of a dream-oracle, communicated by the hero Archilochus at Mallos to Sextus Quintilius Condianus ; a boy strangling two snakes, and a lion hunting a young stag. The reference to the downfall of the two brothers Quintilius was only recognized after the event in 183.³ At Lebena in Crete an inscription records one Diodorus who consecrates to Asklepios two ' dream-pictures ' (i.e., pictorial representations) for the restoration of his eyes.

The most memorable events were to be recorded in sculpture and painting, not only on particular occasions, but for eternal reminiscence. Sculpture, painting and mosaic were employed on a large and small scale, after the third century chiefly the two last (as the technique of sculpture became less adaptable and large coloured pictures were best suited to create the illusion which the popular taste required), to immortalize the memory of the imperial battles and sieges, conclusions of peace, triumphs, speeches, acts of beneficence, sacrifices, hunts, games, gladiatorial fights and *venationes*. But the reliefs on Severus' triumphal arch even show a sad falling off ; one may surmise that the comprehensive representation of his deeds was executed in a mosaic or painting in a columned hall erected by his son. If after a hated tyrant's death his monument were thrown down, such pictures would not have been spared. Thus the Senate had a large picture in front of the Curia, on which Maximin had had painted his victory over the Germans, burnt after his fall ; but much would escape destruction, especially inside the imperial palaces.

As late as Diocletian, in a colonnade in the Gardens of Commodus a mosaic was to be seen, representing him and his friends (amongst them Pescennius Niger) sacrificing to Isis.

Portraits were made mainly for interiors and private purposes ; but honorary pictures (besides statues) were common in temples or public buildings, especially in the Greek cities. Nero had himself painted on linen as a figure 120 feet high ($35\frac{1}{2}$ metres). Herodian had seen a picture with a body that had two heads, of Alexander the Great and Caracalla. Elagabalus sent as a herald to Rome, a huge picture of his own painting, representing him in native costume sacrificing to his god, and directed it to be set up in the Curia above the statue of Victory. At Rome he painted himself as a dealer in delicacies and salves, a cook, a host, a pandar. A pentaptych in the Palace of the Quintilii represents the emperor Tacitus in five guises. The simplicity of Claudius Gothicus' dress was seen, as late as Julian, in his pictures. When Constantine had the statues of Maximian pulled down, his pictures vanished from the walls. Portraits of emperors were commonly seen in private houses. Tacitus (the Emperor) directed that every senator should possess a picture of Aurelian ; the full-length pictures of Alexander Severus in a white garb, which lasted as late as Constantine, must have been in part single portraits. A picture of Trajan fell down at the birth of Alexander Severus in a temple on to his mother's bed and foretold his accession. The likeness of Theodosius the Great to Trajan was confirmed by the pictures of the latter. The 'Royal custom' of having portraits of princesses sent to select brides from (of which Honorius speaks in Claudian) may have originated in the East, and thence spread West. The Jewish princess Alexandra, on Dellius' advice, sent Mark Antony portraits of her two children, the sixteen year old Aristobulus, and Mariamne the wife of Herod, in order that their beauty might induce him to accede to her request (the bestowal of the priesthood on Aristobulus).

In private life portraits were largely painted of persons famous, loved and honoured. A portrait of Flora, a courtesan, famed for her relations with Pompey as a young man, was placed by Metellus Dalmaticus in the Temple of Castor in the Forum, which he restored and decorated with paintings and statues. Atticus' friends at Athens had likenesses of Epicurus in pictures, on goblets and stones in rings. Sopolis

and Dionysius were then the most sought-out portrait painters at Rome, and their pictures, even in Pliny's time, filled the galleries; but Iaia of Cyzicus was considered better for portraits of women. She also painted herself in the mirror. Pliny states that portrait painting gave way to bronze and silver medallions; he refers to the *atria* of the great; the medallions were too expensive to be in general use.

In the later Republic the love of portraits created collections of those sold by the booksellers. Atticus published a collection of portraits of famous Romans with short biographical notes. Varro wrote a long book with 700 portraits of Greeks and Romans (statesmen, generals, poets, authors, learned men, artists, etc.), and, as Pliny says, gave them an omnipresence by his large exports of them to all countries.

Authors' portraits usually accompanied their writings. Seneca speaks of copies of the likenesses, as well as of the works, of famous literary men. Martial's first collection of epigrams was decorated with his portrait, and a small parchment edition of Virgil in a similar manner; philosophical books were distinguished by scrubby heads of hair and beards. According to Galen, painters' eyes suffered from working on white parchment, probably an allusion to these and similar illustrations. Honein, a Nestorian Christian (born *c.* 809) states that all the Greek philosophical works translated by him into Syriac and Arabic contained a portrait of the philosopher at a high desk, with pupils standing in front of him. Libraries were adorned not merely with busts and *hermae*, but with painted portraits of authors. A friend of the Younger Pliny, residing in Upper Italy (in Insubrian territory), was commissioned by him to procure the portraits of Cornelius Nepos and Titus Catius (natives of the district) for another friend's library; Pliny requests that the work may be intrusted to a thoroughly competent artist.

In the larger towns at least only experienced artists received commissions. Martial had his portrait painted for Caecilius Secundus, commander of the forces on the Danube, and for the library of Stertinius Avitus. He also mentions portraits of the tragic poet Memor; of Caesonius Maximus; of Camonius Rufus, who died at the age of twenty; of Marcus Antonius Primus, crowned by him with violets and roses. All these appear to have been half-length. Although Statius did

not know the mother of Claudius Etruscus, he could see from her portrait that her beauty was not exaggerated. Statues of the deceased members of a family were as common as paintings; Pausanias 'never saw Antinous in life, but had seen statues and paintings of him', the latter, chiefly representing him as Dionysus, being especially numerous in his temple at Mantinea. Commodus had his favourite Marcia painted as an Amazon. Judging from her portraits, the mother of the sophist Alexander Peloplaton was extremely beautiful, worthy to be compared with the Helen of Eumelus. In the temple of Artemis at Perga there was a painting of the sophist Varus. Plotinus refused to sit for a painter or sculptor, but Carterius, the most famous painter of his time, attended his lectures and afterwards painted him from memory. The vogue of portrait-painting is shown by Lucian's ridicule of the folly of those (mostly women) who charged the artist 'to take a bit off the nose, or to make the eyes blacker'; and by Plutarch's remark, that painters sacrificed everything to the reproduction of the features as the index of character. A stock subject of the Greek rhetorical schools was the speech of a painter, enamoured of his own portrait of a girl.

The numerous portraits on wood found in the Fayum near Lake Moeris, inserted over the face of mummies, give an excellent idea of the art as practised by Egyptian Greeks. 'Belonging chiefly to the Roman period, these portraits (in encaustic, distemper, or combined) are lifelike and characteristic representations, equal to those of modern times'.

Likenesses set up in public places were of course nearly all plastic. Many such figures, and a far larger number of inscribed pedestals, have been preserved. These remains, supplemented by the statements of contemporaries, enable us to form a conception of the incredible number and variety of such monuments, and to explain their origin. Indeed, an approximate idea of the enormous artistic output of the first two centuries of our era will be best obtained by a consideration of the chief classes of these public or private effigies. In the case of portrait-painting, our information is too scanty.

First and foremost come the busts, medallions and statues of the emperors and of the members of the imperial families. A likeness of the ruling prince, as an object of general cult, was to be seen in every camp and city. The Senate decreed

that there should be a statue of Caesar 'in the cities and in all the temples of Rome'. Augustus limited the worship of his person to the provinces; Tiberius only permitted his statues to be used to decorate the temples, and forbade their being placed amongst the images of the gods. At the beginning of his reign, Caligula issued a similar prohibition, but soon cancelled it; as Josephus says, all the cities of the subject peoples set up his statue by the side of those of the other gods. After the middle of the third century (perhaps even at the beginning of the empire), it was the custom to send laurel-wreathed and (probably) painted likenesses of a new emperor into the provincial cities. Their arrival was announced by sound of trumpet, a long line of soldiers preceded the richly dressed bearer of the effigy, and the people went out to meet him with lights and censers. These imperial effigies, which afforded an asylum for the persecuted (especially slaves), were honoured like the images of the gods, with sacrifices and libations of wine and incense. In the time of Domitian the road that led to the Capitol was overcrowded with the herds of victims intended to honour the hideous effigies of the tyrant with as much blood as he himself had shed. Those who refused to 'adore' were punished for *lèse-majesté*; this was one of the chief causes of the persecutions of the Christians. The heathen worship of the imperial statues lasted far into Christian times, and Theodosius II (in 425) issued a special decree that 'an honour too great for man should be reserved for God'. Any profanation or insult was punished most severely of all, especially in the case of soldiers. As early as 15 A.D. Granius Marcellus, praetor of Bithynia, who had removed the head of Augustus from a statue and replaced it by one of Tiberius, was accused of *majestas* and barely escaped condemnation; soon afterwards, it was considered a capital offence to beat a slave, or change clothes near the statue of Augustus. The jurists of the third century expressly state that no one who melts down dilapidated statues of the emperors is guilty of *majestas*; nor one who repairs a statue, or accidentally hits it with a stone; Severus and Caracalla declared the sale of statues not yet consecrated not a punishable act. Of course, in the case of a consecrated statue, the act was all the more criminal.

The compulsory adoration of the statues of unpopular emperors was followed by their demolition in an outburst of

popular rage at the end of the reign. A striking instance occurred after the death of Domitian. His splendid and colossal monuments were especially numerous on the ascent from the Sacer Clivus to the Palatium, and his statues in silver and gold and of fixed weight, filled not only the Capitol, but (in the words of Dio) nearly the entire empire. At the news of his death, the Senate gave vent to its joy in loud abuse, and further resolved that ladders should be fetched at once, his medallions and statues thrown down, the inscriptions erased, and his memory blotted out. The Younger Pliny, writing four years later, calls the destruction of so many valuable statues an offering to the universal joy. Men delighted in dashing the proud face against the ground, and hacking it with iron and steel, as if their blows could wound and pain. It seemed an act of revenge to gloat over the mutilated trunk and limbs, the sinister and repellent face, as they melted in the flames. This or a similar passage is the origin of the story in Procopius, that Domitian was hewn in pieces, which were collected and put together by his wife as a model for a bronze statue. It was set up on the right of the ascent to the Capitol from the Forum, and, according to Procopius, was the only existing statue of Domitian and bore a striking resemblance to Justinian. The statues of Commodus, Maximin (whose features were painted black) and others were similarly treated; revolts, civil wars, and palace revolutions made such occurrences common to the last days of antiquity. In such cases, as a rule statues were altered instead of being destroyed; according to Jerome, when a tyrant is put to death, his statues and images are thrown down, his head is removed and replaced by that of his victorious rival, to be again removed in turn, while the body remains untouched.

During the first two centuries, however, Domitian seems to have been the only Emperor whose images, except in very few instances, were utterly destroyed. Those of Commodus must have been in part restored. On January 1, 193, the senate with loud acclamations decreed the demolition of the statues 'of the enemy of his country, the murderer, the gladiator', and the erection of a statue of the goddess of Liberty opposite the Curia in place of one representing Commodus as Hercules with bent bow. In 197, the same senate was compelled by Severus to recognize the divinity of Commodus. Na-

turally, consecration gave the statues a longer lease of life, and even led to the erection of new ones. The senate decreed the apotheosis of Caracalla by command of his murderer Macrinus, who ordered the erection of two statues of Severus in triumphal dress, and six of Caracalla (two equestrian, two in military, and two in civilian attire). During the first two centuries Tiberius, Caligula, Nero, Galba, Otho, Vitellius, Domitian were all refused consecration; Nero's veto of the apotheosis of Claudius was removed by Vespasian. But the relatively numerous memorials of them still in existence show clearly that consecration was by no means an indispensable condition of their preservation, although no doubt it most effectually secured it. One of the chief members of the diet of Tarraco, capital of Hither Spain and the centre of the imperial cult, was chosen expressly 'to keep the statues of the deified Hadrian in repair'. A number of statues of the early emperors on certain properties acquired by the younger Pliny were carefully preserved by him. During Nerva's reign he had intended to build a temple for them at Como, but the plan was not carried out; in 101 he again received permission from Trajan to remove them to Como, and to add that prince's statue to the number. The ever increasing list of deified emperors and empresses (to the consecration of Caracalla twenty emperors and six empresses, to the time of Constantine or Julian perhaps thirty-six or thirty-seven divine personages), revised for monumental or religious purposes, tended also to increase the number of such memorials. Thus, at Rome, Domitian built a colonnade, the Emperor Tacitus a temple, of the deified emperors, and Alexander Severus placed their colossal statues in the Forum of Nerva. Sometimes a general feeling of reverence, unconnected with the official cult, led to the preservation and renewal of imperial images. With pious devotion the Roman world offered prayers to the glorified image of Marcus Aurelius, and for more than a century after his death his statue was to be seen amongst the household gods. At the beginning of a new reign, the imperial images were set up without delay in every city and camp; this created a demand throughout Italy and the provinces for sculptors and painters, who perhaps formed part of the regular suite of governors, generals, and highly placed officials. Galba did not start from Spain till he heard of Nero's death (January 8, 68), yet

at the time of his murder (January 15, 69) his images were to be seen 'in all the municipal towns'; Vitellius did not arrive in Upper Italy till the end of May (69), but before the battle of Cremona (end of the year) we read of his images being thrown down in the naval camp at Ravenna. Even on his march from Cologne by way of Lyons to Italy, before he reached Vienne, equestrian statues were erected in his honour in several places, the collapse of which was regarded as an evil portent. The erection of a statue to the younger Faustina at Olympia cannot have been decided upon until her father had been adopted by Hadrian as his co-regent and successor (i.e. after February 25, 138); the inscription on the pedestal (still extant) must have been added before the news of the death of Hadrian at Baiae (July 10, in the same year) reached Greece. The two Gordians reigned at most thirty-six days; immediately after the proclamation of the elder the cities of Africa were full of his statues and images. Pupienus and Balbinus reigned three months (April to July, 238). When Maximin was murdered before Aquileia at the beginning of May, his images and statues were thrown down, and his soldiers compelled to worship those of the 'senatorial emperors'; in a letter to Pupienus and Balbinus the consul Claudius Julianus congratulates the legions and auxiliaries, 'who adore your images throughout the empire'. Artists in the camps, whose business it was to renovate the medallions of emperors and others, often used to decorate the colours, and could be employed for other purposes; thus, numerous statues of Alexander the Great were set up by order of Caracalla.

Statues and images of the ruling prince were found throughout the empire, and were especially numerous in all the more important places. As a rule, they served for the adornment of public places and buildings (governmental, administrative, and legal). In his *Apologia* delivered before the proconsul Claudius Maximus at Sabrata (Tripoli), Apuleius expresses his disgust that, 'in the presence of the statues of the emperor Pius', a son should charge his mother with disgraceful conduct. They may have been set up by governors and government officials in such places; but rural and provincial corporations and all flourishing communities were also obliged to render homage in this manner, sometimes at enormous expense. Thus, in the first year of Caligula's reign, a special

embassy was sent to announce the honours decreed him by the provincial diet of Achaëa (the pan-hellenic synod). Among other things, it had been decided to erect a large number of statues, but Caligula would only allow four to be set up where the sacred games took place (Olympia, Delphi, Nemea, the isthmus of Corinth). Statues were doubtless most numerous and most esteemed in those provincial capitals, where the temple was the centre of the imperial cult, in which all the communities took part. In Egypt, to defray the cost of erecting imperial statues in all the temples, a kind of poll-tax, called a 'statue tax', was imposed upon the people.

Private individuals also were obliged to show their loyalty in this way, especially at Rome. During the age of the Antonines, the imperial images were to be seen everywhere, 'in the money-changers' offices, in the shops and workshops, under the eaves, in the vestibules, and at the windows'. Certainly, as a rule they were badly painted, or coarsely modelled; but those in wealthy and distinguished houses were no doubt of superior workmanship. Further, in the larger cities, it was by no means uncommon for private individuals to set up statues of the emperors in public.

Perhaps Hadrian was the emperor in whose honour most monuments were erected in the provinces, especially in Greece, the special recipient of his favours. His statues were set up by communities, cantons, and corporations in various places—Delphi, Olympia, Thebes, Syros, Coronea, and Samothrace—but especially in Athens. Each of the thirteen cuneiform sections of the theatre of Dionysus contained a statue of Hadrian, all, with the exception of one (the large one of the emperor as archon), erected by the twelve *phylae* (tribes) of Attica after the celebration of the Dionysia in the spring of 126. Pausanias mentions two more, in the Ceramicus and in the Parthenon. But the temple of Olympian Zeus, completed and dedicated by Hadrian in 129, and its immediate neighbourhood contained the greatest number. Before the façades there were probably four statues of the imperial architect, two in Thasian and two in Egyptian marble; in front of the columns of the colonnades that ran round the building were statues from beyond the seas, in bronze, others from Greek towns, and others given by private individuals. Numerous pedestals and inscriptions still survive. All, however, were surpassed

by 'a colossal statue well worth seeing', set up by the Athenians behind the temple. If it is true that the Athenians erected 360 statues of Demetrius of Phalerum, those of Hadrian at Athens which are known to us must have formed only a small proportion of the whole. He had far greater claim on their gratitude, and the expense was far less than 450 years earlier.

But, in spite of the rivalry between provinces and towns, eager to testify their loyalty and attachment, the number and magnificence of the imperial statues must have been greatest in Rome itself. Augustus, in the *Marmor Ancyranum*, states that about eighty silver statues (full length, in a chariot, and equestrian) had been erected to him in Rome by states and individuals, all of which he had melted down, to defray the expenses of the golden offerings, chiefly tripods, deposited in the temple of Apollo on the Palatine in his own name and in that of the founders. Although it may seem incredible to us, his full-length bronze and marble statues must have been reckoned during his lifetime by hundreds at Rome, by myriads throughout the Empire. During the growth of the monarchy, the spirit of servility, purposely kept in check by Augustus, had not reached its height; yet none of his successors obtained such homage as he, the saviour of the world and founder of the new régime. Certainly the length of his reign (44 years) may account for the number of his monuments being greater than those of any other emperor.

Compared with the Roman empire, the territory governed by the first Napoleon and his dependent princes was insignificant; his person was never the object of a religious cult, and the consequently limited demand for representations of it was fully met by drawings and reproductions; nevertheless, in the three years from 1809 to 1812, about 1,500 busts of him after Chaudet were turned out from Carrara.

In the first centuries of our era, imperial likenesses were only exceptionally old ones altered or renamed; since (as Dio of Prusa says) those who were to be honoured would have considered it an insult rather than an act of homage. Instances, however, were known in Greece during Republican times. Cicero (in 50 B.C.) speaks of forged inscriptions on foreign statues; two colossal statues of Eumenes and Attalus at Athens were renamed as those of Mark Antony. A statue seen by Pausanias before the temple of Hera at Mycenae and

according to the inscription intended for Augustus, was identified locally as Orestes. But this is the only other known instance of renaming a foreign statue after one of the earlier emperors. Certainly, after 15 A.D. few artists, for the sake of gain or economy, would have ventured on anything of the kind even secretly, since discovery would have laid them open to the charge of *majestas*. The Rhodians, who were very lavish in bestowing statues (as a rule simply altered or renamed), were reproached by Dio in a lengthy oration for their unworthy conduct, which was the more inexcusable, as they continually set up new statues, especially of emperors and highly placed officials. His remark that there would be no reason to reproach them, if they treated all alike 'with the exception of the emperors', shows that he considered such transformations to be entirely inadmissible in their case. Philo says that the Alexandrians desecrated all the synagogues which they could not destroy, by placing in them images of Caligula. In the largest they set up a bronze statue in a rusty, damaged four-horsed chariot from the gymnasium, formerly dedicated to some Cleopatra. 'It is evident that this substitution exposed its authors to the risk of a serious accusation, even if it had been a new chariot dedicated to a woman, or an old one dedicated to a man, since it was originally intended for some one else than the emperor. Ought not those who erected such a monument in his honour to have done all they could to prevent his hearing of it, seeing that he attached such importance to everything that concerned his person?' But the alteration of heads and inscriptions does not seem to have been common in the early empire even in the case of other monuments; it was most frequent in the Greek towns, where there was a large stock of old statues. Not merely are the known instances isolated cases, but Dio (in the oration already referred to), while rebuking the Rhodians for the bad habit which had 'for some time' been gaining ground amongst them, declares that other cities, less wealthy or even poor, such as Athens, Sparta, Byzantium, and Mytilene, were completely free from it. This would seem to show that Rhodes was the only place in Greece where such practices were common; Rhodian statues, like actors, were said to be continually changing their rôle.

The same applies in great measure to the images of the em-

presses and the heirs to the throne, and even to other members of the imperial household. During the sojourn of Tiberius at Rhodes in disgrace, after his quarrel with Gaius Caesar, the inhabitants of Nîmes threw down his statues and images, from which we may conclude that there were statues of him in all the larger towns, especially those which (like Nîmes) were connected with the imperial house. At the news of the death of Gaius and Lucius Caesar, Pisa (whose patron Lucius was) ordered the erection of an arch decorated with the spoils of the peoples he had conquered, with a statue of himself in triumphal robes, and on either side gilded equestrian statues of both. After the death of Aelius Verus, his destined successor, Hadrian ordered temples to be built in his honour in certain cities, and 'colossal statues' to be erected throughout the empire. It is well known that Antinous was represented in painting and sculpture in nearly all the provinces.

The highest functionaries were honoured in the same way, especially the declared favourites of the emperor. When Sejanus was at the height of his power, senators, knights, tribes, and the greatest men of Rome erected so many statues in his honour, that (as Cassius Dio says) no one could tell their number, especially after Tiberius, in accordance with a resolution of the senate, had ordered a full-length bronze statue of him for the theatre of Pompey. As a rule, the images and statues of the emperor and his *alter ego* were placed side by side, even in the camps (except in that of the army of Syria); and Tiberius allowed the images of his favourite to be worshipped in the generals' quarters, the *fora*, and the theatres. His sudden downfall in the year 31 was the signal for the destruction of all these monuments. His statues (says Juvenal) were torn down from their pedestals by means of ropes, and dragged in the mire. The wheels of the two-horsed chariots and the legs of the innocent horses were shattered by the axe; soon, the head but lately worshipped by the people melted and crackled in the flames; the colossal statue was consumed; the face, once the second in the empire, was made into pots, pans, basins, and chamber-pots. Plautianus, the favourite of Severus, experienced the same fate. According to Dio, his statues, set up by the senate as well as by private individuals, were larger and more numerous than those of the emperors, even in Rome. This aroused Severus' suspicion;

after Plautianus' fall, 'his statues were thrown down throughout the Empire'.

If only a few were honoured by statues throughout the empire, they were bestowed upon an incredibly large number in definite districts or single towns. It was the usual way for provincials to show respect for those who possessed or might possess the power to benefit or injure them, especially the governors, to whom, even in the last days of the republic, it was the custom to build temples. Cicero, when proconsul of Cilicia, refused 'statues, temples, four-horsed chariots (τέθριππα)'; on the other hand, Verres compelled the Sicilian communities to erect a large number of statues to himself, his father, and his son (then a mere boy); there were so many of them in Syracuse, that he seemed to have set up as many as he took away. Gilded equestrian statues of him, the expenses of which were defrayed by Roman merchants, the cultivators of public lands, and the Sicilian community, were also to be seen in Rome. The terrible rule of the provincial satraps was no doubt greatly restricted, but never entirely abolished by the monarchy; the inhabitants were still compelled, directly or indirectly, to honour their tyrants and spoilers by memorials, the refusal of which was a tacit accusation. According to Dio, the Rhodians excused the practice referred to above by the plea that they were obliged to honour so many officials, not only on their merits, but because of their power. They feared them all, and believed their liberty in danger, if they neglected to erect a bronze statue to each. 'If you really have to fawn upon each new arrival like dogs, or to risk incurring wrath and hatred, then', says Dio, 'you are in evil plight'.

Distinguished Romans who held no official position, and even ladies, were honoured by statues, especially in Greece; as is shown by numerous inscriptions of the early empire on pedestals in Athens. The more indispensable was it for cities and provinces to show their gratitude for actual benefits received, above all, for protection and patronage (the *patronatus*). In Sicily, equestrian statues of the Marcelli, as patrons of the island, were seen in all the *fora*. The hero of the Apuleian romance, who belonged to a distinguished Thessalian family, was held up to public ridicule in Hypata; the magistrates apologized, and announced that the city had chosen him for its *patronus* and had resolved to set up his image in bronze.

Subordinate official and semi-official positions entitled their holders to this honour. Flavius Sabinus, the father of Vespasian, who had been one of the farmers of the *quadragesima* (tax of $2\frac{1}{2}$ per cent. on imported goods) in Asia, was honoured by statues and laudatory inscriptions. Titus, when military tribune in Germany and Britain, had gained a reputation for energy and moderation, 'as is shown by the number of statues and images with inscriptions in both provinces'. Lucius Licinius Secundus, the attendant (*accensus*) of the powerful Lucius Licinius Sura in his three consulships (98, 102, 107), had at least thirteen statues in Barcelona, three of which were erected by Spanish town councils. When monumental honours were so lavishly bestowed, real distinction entailed enormous expense; Apuleius says, in praise of the consular Aemilianus Strabo (consul 156), that all the provinces congratulated themselves on setting up in his honour four and six-in-hands, surmounted by his statue.

Real or imaginary services of individuals to the community were generally rewarded in the same manner throughout the empire. The use of portrait statues, at first rare, was subsequently adopted, says Pliny, by the whole world under the influence of a philanthropic ambition; the *fora* of all the *municipia* were adorned with statues; thus the memory of men of merit was handed down to posterity and their honours recorded for all time on pedestals, not merely on their tombs. Thousands of pedestals with Greek and Roman inscriptions bear witness to this. There were more portrait statues of deserving citizens, patrons and protectors of the city in Pompeii than in any modern capital. In addition to five colossal statues of emperors and members of the imperial house, 70-80 places were reserved in the Forum for life-size equestrian statues, and behind each a place for a full-length statue. The entrance-hall of the *macellum* (provision market) contained twenty-five statues, the open space of the temple of the Lares eight, the entrance-hall of the building of Eumachia twenty-one. The average number of statues in second-rate towns was just as large. In a double portico (beginning of the second century) at Termessus in Pisidia forty-six bases of statues of men and women have been found, which stood in front of or between the columns (twenty-six of victors in athletic contests, fifteen of officials, priests and priestesses). It was no

uncommon thing for traffic to be hindered by the number of statues in the *fora*, as at Cirta (where one was stolen). Ambition and municipal patriotism, as already observed, combined with due regard to public opinion to stimulate wealthy and distinguished persons to render services to their communities. The latter, on their part, were proud to point to the numerous monuments as evidence that it was esteemed an honour to make sacrifices for them, and that they were in a position to reward their benefactors and decorate their city at the same time. It was almost impossible for a wealthy and distinguished family to live in an important town for any length of time without earning the honour of a statue. Dio boasts that his ancestors, his father (for a long time president of his native city), his brothers and other relatives had been honoured with many statues, public funerals, athletic games held near their graves, and other distinctions; his mother had not only a full-length statue, but also a temple.

As a rule, investiture with certain high offices only accessible to the provincial aristocracy (such as the chief priesthood), carried with it the honour of a statue. By a law which has recently become known, when the priests at Narbo retired from office, it was proposed by their successor (and probably resolved by the provincial diet) that they should be allowed to set up statues themselves. Numerous pedestals of such statues have been found at Tarraco and Lugdunum, all (at Lugdunum) or for the most part (fifty-two out of about seventy at Tarraco) set up, not by the priests themselves, but by the province, more rarely by native communities or relatives on the resolution of the diet. In Spain the honour was extended to the priestesses who shared their husband's dignity.

A statement of the services most frequently rewarded in this manner in Italy and the provinces will give an idea of the extent of the practice. They consisted chiefly in expenditure of money and personal exertions for the benefit of the city—the erection of useful and ornamental buildings; donations for various purposes (the purchase of corn in time of dearth); but above all banquets (on single occasions or yearly) to the citizens, accompanied by a distribution of money; spectacles of all kinds (especially wild beast and gladiatorial combats); lastly, voluntary missions to emperors and governors, at the expense of the envoys. Distinguished teachers also had a

right to the honour—world-famous professors of eloquence, who attracted crowds of pupils from distant lands, and even modest school-teachers (at least after death) if they had obtained a reputation for learning. On the capitol at Beneventum there was a seated statue of Orbilius Pupillus (the teacher of Horace, who died in a garret at the age of a hundred), in a Greek cloak with two book-cases by his side ; at Praeneste, one of Marcus Verrius Flaccus, surmounting his calendar graven on marble tablets in the Forum. Native and foreign literary works, at least in Greece, were similarly rewarded, sometimes too generously. According to Dio of Prusa, the Athenians erected the statue of an absolutely insignificant poet (perhaps the improviser Quintus Pompeius Capito) by the side of that of Menander. At Halicarnassus the tragic poet Gaius Julius Longianus of Aphrodisias (lived under Hadrian), who 'had delighted the older and benefited the younger citizens' by his poetical recitals, was honoured by several bronze busts, set up in the most frequented places—the sanctuary of the Muses and the gymnasium of the Ephebi—'by the side of old Herodotus' ; his writings were accorded a place in the public libraries ; and the company of Dionysiac artists had his portrait painted full length, to be set up wherever he pleased in his native place. The poet Maximus of Apamea had a statue in Cyzicus, where he had twice gained the prize in a poetical contest. Naturally, native celebrities, especially artists of all kinds, had precedence over foreign. Thus, at Ostia, an athlete or musician, who had gained prizes in all parts of the world, 'for his distinguished skill and devotion to his native town' ; at Praeneste, Marcus Aurelius Agilius Septentrio, the first pantomime of his age, 'for his remarkable devotion to his fellow-citizens and native town'. The same honour was also frequently bestowed on women. Further, statues were erected to the dead, even to little children, to console and honour their relatives, especially parents. At Brixia (Brescia) the town council decreed a gilded statue to a boy, who died at the age of six years, two months and five days, to console his father. Monuments of this kind were so common in Cicero's time that he looked upon them as a sign of the extravagance of the age. A still higher distinction was a statue on a two-horsed chariot (*biga*). The citizens of Praeneste asked that a 'patron' of the town, a member of the

equestrian order, who had provided gladiatorial shows lasting two days, might be so honoured ; but the town council would only grant an equestrian statue. The inhabitants of Panhormus (Palermo) urgently demanded a considerable number of statues on *bigae* for an imperial *curator* of the *kalendaria* (books containing the names of persons to whom public money had been lent on interest), but he was satisfied with two and (probably) three equestrian statues.

To enhance the honour, several statues were erected to the same person, e.g., by the Athenians to their wealthy fellow-citizen and epic poet Julius Nicanor (lived under Augustus), who had redeemed the island of Salamis, which they had been obliged to mortgage or sell. Inscriptions describe him as a 'second Homer' and a 'second Themistocles'. In the time of the Antonines one Publius Lucilius Gamala was honoured by two bronze statues (one gilded) for his numerous gifts to Ostia. Artemidorus, the son of Augustus' friend Theopompus, received in his native city (Cnidus) 'three marble, three golden, and three bronze busts', in addition to a golden bust in the temple of Artemis. At Aphrodisias it was decided to set up for some one unknown 'gilded portrait medallions and bronze and marble statues in the temples and such public places as he himself might select'. The town council of Calama in Numidia decreed five statues to a priestess, who had been exceedingly generous to the town. Similarly, the community of Cirta offered a number of statues of Sosia Falconilla after her death to her father Quintus Pompeius Sosius Priscus, who only accepted one. The number five in the two last instances is to be explained by the fact that two of the ten *curiae*, into which the citizens in African towns were divided, combined to defray the cost of a statue. At Hippo Regius in Numidia, however, each *curia* erected a statue at its own expense in the villa of a *flamen* of Augustus and chief magistrate, in return for a magnificent gladiatorial show and other services ; and similar instances occur in other African towns. In other provinces, each district (*vicus*) did the same, e.g., at Alexandria Troas, where there were ten of them ; as early as the time of Sulla, all the districts set up statues to the popular Marius Gratidianus, which were pulled down by order of Sulla after his terrible murder. According to an inscription of about the time of Claudius found in Aventicum (Avenches), the community of the Helvetii ordered

statues of a certain Gaius Valerius Camillus to be set up, for itself and for the individual cantons. In a similar manner all the twelve *phylae* of Attica showed their gratitude to Tiberius Claudius Atticus for a general entertainment, an honour hitherto only bestowed on the Emperor Hadrian.

Very frequently, if not as a rule, the recipients of the honour paid for the cost of the statue. The frequent occurrence in inscriptions of the formula, 'content with the honour, he has defrayed the cost', makes it certain that a promise to that effect was required in very many cases before the statues were decreed. Quite exceptionally, the recipient allowed the necessary sum to be collected, which he subsequently reimbursed. At Forum Sempronii (Fossombrone) the town council on one occasion secretly voted and presented a finished statue, that it might not be refused a second time out of modesty. In Greece, relatives often defrayed the expense.

In the second century, the foreigners most frequently distinguished were poets and wandering professors of eloquence (sophists). Thus, there were statues of Aristides in several places, one at Smyrna set up by Alexandria, Hermopolis magna, Antinoë, and the Greeks of the Delta. A statue of the author of a speech attributed to Dio of Prusa in the public library at Corinth soon afterwards disappeared. Apuleius, in thanking the town council of Carthage for a statue voted by that body, mentions that he had already received the honour in other places; and that even in second-rate towns the money for the bronze and the services of the artist had always been forthcoming. When the philosopher Demonax visited Olympia, the Eleans voted him a bronze statue; but he refused it, since it would have been a censure on their ancestors, who had not done so in the case of Socrates and Antisthenes. The emperor Aurelian saw many images of Apollonius of Tyana in the temples. The philosopher Flavius Archippus, convicted of forgery in Bithynia under Domitian, had often been honoured by a statue—a distinction frequently bestowed upon philosophers as late as the time of Severus. Heraclitus of Rhodopolis in Lycia, a physician and medical writer of the first century A.D., was honoured with a gilded bust and 'the statue for scientific culture' (such as was usually erected to authors and learned men) by his native place, and also by the communities of Alexandria, Rhodes and Athens, by the Areopagus, the

Epicurean philosophers, and the 'sacred' association of theatrical artists.

In the *municipia* this honour was usually decreed in the name of the town by the whole body of citizens or by the town council ; in Rome, up to the time of Diocletian, by the Senate. After the death of Lucilius Longus, one of the oldest and most intimate friends of Tiberius, in 23, the Senate decreed him a statue at the public expense in the Forum of Augustus ; 'for at that time', says Tacitus, 'everything was still managed by the Senate'. Caligula's edict, that no image or statue of a living person should be set up without his express permission, abolished the privilege of the Senate ; Claudius, however, reaffirmed it, since (in 45) he even made the erection of statues by private individuals dependent upon that body ; permission was only given to those who had erected a public building at their own expense, or to their kinsmen. Hitherto every one had been allowed to set up his image publicly, painted or in stone and brass. The result was that Rome was overcrowded with personal memorials, which Claudius remedied by redistribution. Yet the erection of statues in temples (e.g., of Antonius Musa, Augustus' physician, by voluntary contributions, in the temple of Aesculapius) was probably permitted to private persons as before.

As the Senate always voted this honour by agreement with, if not by direct command of, the emperors, the erection of statues was also ascribed to the latter. Cassius Dio says of Tiberius, that he honoured many after their death with statues. As a rule, the living, with the exception of the members of the imperial house, were not so honoured ; in the case of the dead, both senate and emperors were lavish. Under Nerva, Vestricius Cottius, who died very young ; under Marcus Aurelius, the most distinguished victims of the plague and the nobles who had fallen in the Marcomannic war, all received statues (the latter in the Forum of Trajan). On the accession of a new emperor his deceased relatives generally received statues. Under Caligula, Claudius narrowly escaped being deprived of the consulship (in 37), because he had been remiss in setting up the statues of the emperor's deceased brothers, Nero and Drusus (died 30). In 54 Nero solicited from the Senate a statue for his father, Gnaeus Domitius. Antoninus Pius 'accepted from the Senate the statues of

his father, mother, grandparents, and brothers, who were then all dead'. Marcus Aurelius even honoured his parents' friends after their death in this manner, and Severus his deceased relatives, his parents, his grandfather, and his first wife.

The honour was sometimes, however, bestowed upon the living, as by Trajan upon his valued friends Sosius Senecio, Cornelius Palma, and Publius Celsus. Marcus Aurelius demanded a statue for Junius Rusticus, his teacher in philosophy, after his death, and for Fronto, his instructor in eloquence, during his lifetime. On his and his co-regent Commodus' proposal the Senate voted three statues to Marcus Bassaeus Rufus, praefect of the praetorian guard: a gilded one in the Forum of Trajan, another in civilian dress in the temple of Pius, a third in a coat of mail in that of Mars Ultor. Statues were also military rewards. Thus, Ammianus Marcellinus saw the statues of the leaders of a daring sally from the town of Amida in Armenia (Diarbekir), which had been set up by order of Constantius in a busy part of Edessa.

At Rome, especially, the *fora* and their colonnades, the chief temples and their forecourts were full of statues, the old Forum and the forecourt of the temple of Jupiter on the Capitol even in republican times. Owing to want of room, a number of them were removed by Augustus to the Campus Martius. Up to the time of Trajan the triumphal statues decreed by the Senate were set up on the Forum of Augustus; afterwards, on Trajan's own Forum, which from the time of the Antonines became 'the centre of splendour and distinction', as is shown by numerous pedestals (extending to the sixth century) which have been found there. The rare honour of a statue on the Palatine was voted by the Senate to Lucius Otho (father of the Emperor Otho) for the discovery of a plot to murder Claudius. There, also, 'above the triumphal statues of the Forum', Nero in 65 had the statues of Nerva (afterwards emperor) and Tigellinus set up. By a resolution of the Senate Sejanus received a statue in the theatre of Pompey, for having checked the spread of a fire that broke out in it in the year 22. Passienus Crispus, distinguished as an advocate in centumviral processes, had a statue in the Basilica Julia.

The life-size statues of the chief Vestals stood in the peristyle of the house of the Vestals round the columned hall;

sixteen of them are preserved entire or in fragments, besides thirty pedestals with inscriptions, twenty-seven belonging to the period from the third to the eightieth year of the fourth century. These solemn and touching memorials were erected by priestly colleges and individual priests, by near relatives (brothers and sisters and their families), by subordinates, freedmen, and others who owed a debt of gratitude to the chief vestals. Old statues must from time to time have been removed to make room for new, especially as several were set up to the same person (e.g., seven to Flavia Publicia about 250 A.D.).

Although not so often mentioned, we cannot be sure that memorials of private persons, erected by colleges (guilds, religious and other associations) to their male and female patrons, and by soldiers to their commanders, were less numerous than public ones. At Palmyra in the second and third century it was customary for merchants travelling by caravan to set up a statue to the leader of the caravan (*συνοδιάρχης*), if he performed his duty satisfactorily. About 150 A.D., the large number of memorials of stage artists, musicians, athletes, and chariot drivers in circus costume, set up by their admirers and the different 'factions', and of pantomimes amongst the images of the gods astonished the stranger. Nero compelled the aged tragedian, Pammenes, to compete with him, so that he might insult his statue after he had gained the victory. Famous athletes were honoured with bronze statues in many places, chiefly presented by their associations; in Greece they often formed part of the prize; the victor at the Spartan Leonidea received 100 *drachmae* for a bust.

In private life a statue or bust was a favourite way of showing friendship, respect, or gratitude. Pupils thus honoured their teachers, patients their physicians, accused persons (on acquittal) their advocates, clients and freedmen their patrons (in their *atria*, according to the Elder Pliny), hosts their distinguished guests. The chief Vestal Campia Severina (third century) received a statue from a man who was indebted to her for admission to the equestrian order and military promotion; and from another, who had been appointed chief administrator of the funds of the imperial libraries on her recommendation. The friends of Decimus Junius Melinus, the first *eques* from Cartima in Baetica, ordered his statue to

be set up there during his lifetime ; he died before its completion, and his mother carried out the work at her own expense. Of the thirteen statues of Lucius Licinius Secundus (see p. 288) at Barcelona one was set up by the *seviri* of the *augustales*, of whom he was one ; another by a college ; two by individual *seviri* ; four by friends ; one by a freedman. Even high officials thus showed their respect to their inferiors. Apuleius is profuse in his gratitude to the consular Aemilianus Strabo, who had written to the common council at Carthage that he intended to erect a statue to Apuleius in that city.

Lastly, it was usual at all times for private persons to erect their own statues during their lifetime, at Rome (before the year 45) even in public places. After that date permission had to be given by the senate, and in other places by the common council, who also assigned the site. In a town in the south of Spain the common council, in addition to a public banquet (*cenae publicae*) gave a lifelong *Augustalis* a site for the statues of himself, his wife and children. Of course, any one could set up whatever memorials he pleased on his own property. In his garden on the further side of the Tiber Regulus had covered a large extent of ground with immense colonnades and the bank of the river with his statues ; according to his bitter enemy Pliny the Younger, he was at once avaricious and extravagant, a blackguard and a braggart. When his son died quite young in 104, he had a large number of statues and likenesses of him executed in all the workshops, in colours, encaustic, bronze, silver, gold, ivory, and marble. Claudius Etruscus (in Statius) declares his intention of immortalizing the features of his father, who died full of years, in 'bright stone', ivory, and gold, and on tablets with coloured wax.

The public and private memorials of the dead, painted or carved, far outnumbered those of the living. Herodes Atticus honoured his deceased wife Annia Regilla with numerous monuments, and his foster-sons Achilles and Polydeuces (died after 130) with marble statues 'in fields and thickets, by the side of springs and under shady plane trees', representing them hunting, making ready for or resting from the chase. Inscriptions (some of which are preserved) pronounced a curse on whosoever should mutilate or remove them. Monuments to the dead, some of them combined with burial at the public

expense, often adorned their graves. Wills often contained directions as to such monuments ; thus, a *duumvir* of Brixia ordered seven statues with pedestals to be set up to himself, his son, and five other persons. One of the inhabitants of a North African town bequeathed a sum of money to the community ; the interest was to be distributed every year on his birthday and every seventh year devoted to defraying the cost (32,000 sesterces, £348) of the erection of his statue. In a city of Southern Spain, a woman left instructions that a statue should be erected to her at a cost of 8,000 sesterces (£87) ; it was to be adorned with various trinkets ; the exact number of the (golden) links and pearls for each row was given ; her son spent 7,000 sesterces on silver bracelets set with precious stones and a jasper ring. A wealthy man in the Langres district ordered a two-storeyed mausoleum to be erected, the upper storey forming an *exedra* to contain two statues of the deceased, one (sitting) ' of the best marble from over sea (Greek)', the other of the best bronze of the second class (*aes tabulare*, used for public notices), at least five feet high. In front of the structure an altar, ' carved in the best style from the best Carrara marble', was to contain the remains of the testator. Trimalchio in Petronius orders a statue with a little dog, with wreaths and unguents on the ground ; on his right a statue of his wife, a dove in her hand, and a little dog on a lead. Domitian's secretary, the freedman Abascantus, built a palatial tomb for his wife Priscilla, in which she was represented in the likeness of different goddesses, as Ceres and Ariadne in bronze, as Maia and Venus Casta in marble. Representations according to life were, however, the rule. Many of the extant portrait statues and busts belong to sepulchral monuments. The wanderer approaching a large city was greeted on either side of the highway by long rows of bronze and marble effigies of men and women of earlier generations.

Admirers frequently erected monuments to distinguished men of earlier times. Thus Caracalla set up ' in every city ' images and statues of Alexander the Great, alone or in company with his own (especially on the Capitol in Rome and in temples elsewhere), of Sulla, and of Hannibal.

Painting and the plastic art were employed till the last days of antiquity in the production of personal memorials. At the end of the fourth century, Ammianus Marcellinus

mentions the desire of immortalizing themselves by ostentatious effigies (especially bronze statues) as characteristic of the Roman nobles. The rhetor Marius Victorinus, Claudian, and Apollinaris Sidonius were all honoured with statues in the Forum of Trajan; and Ausonius says that, if he were to have the emperor's letter, containing his nomination to the consulship, posted up everywhere, he would be honoured by as many statues as there were pages in it. Standing images were erected at Rome as late as the reign of Zeno (some of Theodoric, which Rusticiana ordered to be pulled down). The most prominent of the numerous statues of Justinian at Constantinople was the colossal equestrian statue of bronze in the Augusteum, holding a sphere and cross in the left hand, the right being extended towards the East with a gesture of command.

(c) *Religious Art*

A third and enormously productive branch of art, which satisfied a widespread need of the entire Roman world, was the religious. For purposes of worship practically plastic art alone was requisitioned; painting and mosaic were employed merely in the decoration of the holy places. The nature, strength, and universality of belief in the gods inseparably connected with the worship of images, will be discussed later. None of the more important figures of the Greco-Roman religious system had lost their sanctity, and, on the other hand, the cult of numerous foreign (especially oriental) gods had spread over the empire, thus increasing the number of divine personages. Various influences, however, increased or diminished the reputation and spread of the cult of individual divinities. The marked preference of certain emperors for certain cults, as that of Augustus for Apollo, of Domitian for Minerva, of Commodus for Isis and Hercules, of Severus for Hercules and Bacchus, was bound to have its effect; the worship of the god distinguished by the emperor became the fashion, and his images multiplied in proportion. It is quite impossible to form an idea of the enormous number of the images of the gods which must have accumulated in the temples in the larger towns. The legend that there were a hundred idols on the Capitol at Trèves is by no means astonishing or incredible.

Donations and foundations for religious purposes, but

especially gifts of images, were the favourite methods of worshipping the gods and soliciting their favour. These images were set up not only in temples, but as ornaments in public places and buildings. According to the Elder Pliny, the inhabitants of Clermont, the capital of the Arverni, erected a colossal Mercury, which took ten years to make, and for which the artist alone received 400,000 sesterces (£4,350). The accidental mention of this fact enables us to form an idea of the money spent even in the provinces on the images of the gods. Made of all sizes and materials and of varying excellence, they employed thousands of workshops throughout the empire. There were doubtless numerous artists in special lines, such as the makers of *genii*,¹ whose shops and factories were situated behind the temple of Castor at Rome.

Near all the more important temples there were probably colonies of artists and artisans, who enabled pious visitors from all parts to show their reverence for the deity by offerings and presents (images, ex-votos, votive tablets), and furnished sacred souvenirs to be taken home; the services of these artists would also be utilized for repairs and decorations. Paintings and bronze and silver statues of the new god Glycon, in the form of a snake with human face, exhibited by Alexander of Abonuteichos to his faithful followers, were to be procured in Paphlagonia and the neighbouring districts. Demetrius the silversmith of Ephesus made models of the temple of the great Artemis, and copies of the famous statue of the goddess herself must have been on sale at various prices. A dealer in ivory wares, mentioned in an inscription found near the temple of Feronia at the foot of Soracte, may have retailed such souvenirs to pilgrims. The clay idols of Aphrodite of Cnidus were supposed to work miracles on the sea; as early as the beginning of the seventh century B.C. it was said that a ship from Naucratis during a fearful storm was saved by an antique statuette of Aphrodite, belonging to one of the passengers, who had bought it in Paphos. Clay figurines of the Cyprian goddess, some sitting, others standing (sometimes with a child in her arms), partly in the strict archaic style, have been found in different places on the island, also in Athens, Syria, Bagdad, the Crimea, and other places.

¹ CIL, vi, 363.9, 177, where, however, Henzen reads *argentarii* (silver workers) for *geniarii*.

Thus, the task imposed upon the arts by Roman culture was threefold : to provide believers with images of the divinity in suitably decorated sanctuaries ; to perpetuate the memory of persons and events ; to brighten and adorn the abodes of both living and dead. Each of these needs was deeply rooted in Roman civilization as developed by the requirements of universal empire, which spread them gradually over the subject world. Art, which alone could fulfil those requirements, followed civilization to the farthest limits of the immense empire.

This has been sufficiently shown by the facts already stated. But no amount of facts would enable us to form a clear idea of this enormous productivity of the arts, which lasted for centuries without intermission, over an area of more than 100,000 square miles. Artistic needs and the activities evoked by them are only known to us moderns as comparatively rare, isolated, and closely restricted phenomena. The need of art, which filled a whole world and perished with Roman civilization itself, remains to a certain extent incomprehensible to us ; the fact that it was really completely satisfied appears fabulous, in spite of irrefutable testimony. The imagination is bewildered by the attempt to estimate the exuberance of works of art of all kinds produced every year in thousands of towns, ever accumulating in still greater numbers in spite of attempts at destruction.

The discovery of buried cities has certainly afforded us a glimpse of this vanished artistic splendour of the Roman world ; and although it has only shown us a diminutive and mutilated portion of the whole, its value is inestimable. These remains create the impression that wealth so lavishly scattered must have been practically inexhaustible. There is no reason to assume that Herculaneum and Pompeii were in any way superior to other cities of Italy in artistic adornment ; on the contrary, everything tends to show that they only represented the average. In the fifteenth century, Ostia was an inexhaustible mine of antiques ; a Florentine of the period was amazed at the number of statues, sarcophagi, mosaics and ruins. Nine years' excavations at Aricia (1787-1796) revealed the greater part of the splendid collection of sculptures made by Cardinal Despuig of Palma in Majorca. Also, works like the Jupiter of Otricoli and the Minerva of Velletri justify us in

assuming that even second-rate towns were richly adorned. In wealth and magnificence they were far surpassed by important cities, such as Capua, Bononia, and Ravenna, and places like Antium (specially distinguished in this respect), which in their turn were left far behind by Rome.

We possess some numerical details of the works of art in Rome. These are furnished partly by statistical notices at the end of a fourth century description of the city (*Curiosum*), based upon a carelessly compiled original belonging to the first century; and partly by a more complete redaction of these notices, used by Zacharias, rhetor and bishop of Melitene, in the composition of his ecclesiastical history in the year 546. We cannot ascertain how much of the information given dates from the first century (about the time of the survey of the city under Vespasian), or how much is an addition from later inventories (such as those of the *curator statuarum*, an official whose name first occurs under Constantine); but in any case it is extremely incomplete. The following is the list. Two colossal bronze statues (that of Augustus in the form of Apollo in the temple of the latter on the Palatine, and that of Nero changed by Vespasian into a sun-god), 22 colossal equestrian statues, 80 gilded and 74 (or 77) ivory images of gods (not reckoning those inside the temples), and 3,785 bronze statues 'of emperors and generals'. Thus, the list does not include the remaining portrait statues of bronze, the numerous 'profane' marble statues, the marble and ungilded bronze images of the gods, which of course were far more numerous than the more costly ones. If we include the statues in the temples, public buildings (*thermae*, porticoes, theatres), palaces and private houses, we can understand how Cassiodorus, after all the destruction (especially by fire) and ravages of earlier and later centuries, could still declare that 'there dwelt within the walls of Rome a people of statues'. 'A great number of these ornaments survived till the seventh century, when Constans II (after 641) plundered Rome so thoroughly, that hardly anything of importance can have been left'. Nevertheless, the remains of the marble works alone, excavated on the site of the city, are sufficient to fill several palaces and museums.

(d) *Artistic Industry*

We have shown how the need of art pervaded the entire

Roman world to an extent almost incredible to us moderns, and how indispensable in all its branches it was to State, to religion, and private life. Of course its extension, and the excellence and range of its productions were in proportion to the condition of the civilization in whose service it was employed. Where civilization was lasting and firmly rooted, its development was rich and magnificent. This, in all probability, was the case even at the farthest eastern limits of the empire, in the cities of the East Jordan district of Batanaea and in Palmyra; Moltke found at Samosata 'the most beautiful marble frieze he had ever seen, with foliage, birds, and oxen as excellently preserved as if they had just been completed'. Where Roman culture was only temporary and superficial, art did not advance beyond paltry beginnings, although even in the least Romanized frontier districts it was not entirely absent. This is shown partly by inscriptions relating to the erection of statues (e.g., in Moesia and Dacia), partly by remains of images, which must have been made on the spot. Near the outposts of the third legion farthest to the south of Tripolis, at the edge of the Hammara, funeral monuments of officers were adorned with sculptures. The best Mithrases of the Rhine districts, the most important of this kind of memorials, are made of Jura limestone, none of marble. All the works there, of this material and of sandstone, are the productions of provincial sculptors and stonemasons, most of whom, although to some extent they imitated Roman models, only possessed a mechanical skill. The fragment (found at Cologne) of a group representing the flight of Aeneas with Anchises from Troy, a capable piece of work, dating at latest from the time of Trajan, is also of Jura limestone. The two Minerva statues from Oehringen in Würtemberg (*Vicus Aurelii* in the *agri decumates*) are also excellent works by native artists. They are made of a yellow fine-grained sandstone, quarried in the neighbourhood, and a very favourite material for Roman memorials in Heidelberg, Ladenburg, Osterburken, and other places. The admirable Orpheus mosaic at Rottweil is made of native stone, and the name of the artist (Pervincus, which often occurs in Mainz and to the south of it) on the famous Neptune mosaic of Bilbel on the Nidda betrays his non-Roman origin. In England also inscriptions have been found which mention a brass-founder and a sculptor. Provincial produc-

tions in painting as well as in mosaic were probably not so inferior to Italian as in the case of sculpture. The better wall paintings of the Roman villas in Gallia Belgica are equal to those of Pompeii.

Leaving out of consideration the varying stages of artistic development in more or less civilized lands, the remains of art throughout the Roman empire exhibit on the whole a complete agreement, not merely in composition and treatment, but also in motives and subjects, with the possible exception of the Celtic districts, which may perhaps be said to have possessed an artistic development of their own.

As contrasted with the 'crowded painted figures' of the reliefs on the tomb of the Julii at St. Remy, the other reliefs of the imperial period almost create the impression of 'a return to the simpler art of earlier times'. But especially in the numerous and important sepulchral monuments of the Meuse and Moselle districts, where the most interesting productions of provincial artists are to be found, there appears an independent and decidedly realistic tendency, and at the same time 'a freshness and skill in moulding, such as Italian monuments cannot show after the time of Hadrian'. Mythological incidents, a favourite subject in Italy for sarcophagi, are entirely absent; the reliefs which adorn these memorials represent scenes from the daily life of the deceased, remarkably true to life, and showing extreme care in the reproduction of details. They differ so greatly from Italian works, that specialists are inclined to doubt whether they belong to the age of Roman antiquity at all. Even in construction and ornamentation they exhibit many peculiarities. The development of this unique artistic tendency in Belgic Gaul is the more remarkable, because in the Rhine countries art is entirely under Italian influence. It would seem as if a hellenizing stream of civilization and art, starting from Marseilles, had travelled along the Rhône and the Saône as far as the Moselle.

Two other provinces are distinguished by artistic peculiarities of quite a different kind: Egypt, the only land where a very old native art, radically different from the universal Greco-Roman, continued to exist, and Palestine, where the religion of the inhabitants filled them with aversion from the plastic arts.

The unexampled conservatism which distinguished Egypt

above all other ancient lands is especially shown by the fact that under the Roman empire architecture, painting and sculpture were essentially the same as during the whole period that followed the loss of national independence. However numerous the changes in art during the course of many centuries, due chiefly to foreign influences and a coarseness dating from the time of the Ptolemies, they were not perceptible to the casual observer of ancient or modern times. Even Egyptian specialists have expressed the belief that certain sculptures of the second century A.D. (as is shown by their inscriptions) might have been produced 3,000 years before Christ. The temples of the Egyptian deities in imperial times were built in accordance with ancient traditions, and the technique of all other arts remained essentially unaltered. The temple walls were still covered with the same carvings and hieroglyphics; the carved and architectural ornaments were still gilded in the same manner; the colours of the paintings were as lively and lasting as in the time when the palaces of Thebes and the Nubian grottoes were built. And yet there is no doubt that a Greco-Roman art existed by the side of the native Egyptian. A complete isolation of Egypt in relation to a neighbouring province like Cyrenaica would be almost inconceivable; now, in the latter, important remains bear witness to the flourishing condition of architecture, sculpture and painting even in the Roman period. According to an English traveller, 'every part of the city of Cyrene and its suburbs must have been full of statues', and excavation would certainly bring to light many excellent sculptures. But the employment of the art of this neighbouring country would not alone have been able to satisfy the need of Egypt, after it became a Roman province. Greek artists and artisans also must have been at hand for artistic undertakings of every kind in a province which was the residence of a Roman governor and his court and had a standing garrison of two legions, and in which there were numerous Greek and Roman inhabitants and visitors. If they worked also for Egyptians, as the portraits found in Fayum seem to show, there is all the more reason to assume that representations of the Greeks and Romans living in Egypt were the work of Greek, not of Egyptian artists. Numerous statues of Antony and Cleopatra had already been erected there; the former were demolished after the battle of Actium,¹ while

the latter were left standing. Eight or nine years later statues of Augustus were carried off from the frontier districts of Philae, Elephantine, and Syene as trophies by invading Aethiopians. Later, a general tax was imposed in Egypt for the erection of imperial statues, and its first Roman Praefect, Cornelius Gallus, ordered his own to be set up throughout the country. A stone tablet at Philae with a report by him (on the suppression of a revolt in the Thebaid, March, 29) contains a likeness of the Emperor (in the form of a horseman galloping up to an enemy fallen on his knees) in deep relief, 'which is foreign to Egyptian art'. Other plastic work mentioned by writers of the imperial period are rather to be attributed to Egyptian artists working in the national manner. Vitrasius Pollio, procurator of Egypt under Claudius, attempted to make statues of the porphyry from the great quarries on the Red Sea (*mons Claudianus*), then opened for the first time, and sent specimens of them to Rome; some remains of these sculptures undoubtedly executed on the spot are apparently still in existence. The innovation, however, met with little approval, and it was not till the third century that a liking for plastic work in porphyry came into fashion. Statues (perhaps chiefly of Egyptian deities) were also made of stone from Memphis. The portrait statue of Pescennius Niger in black marble from the Thebaid was to be seen as late as the time of Diocletian, in the palace of the latter; it had been presented to him by 'the King of the Thebans' or 'the Theban community'.

The aversion of the Jews from the plastic arts, based on their religious dogmas, is well known; 'no images', says Tacitus, 'are to be seen in their cities, to say nothing of their temples; they do not flatter kings, nor show respect to emperors in this manner'. The strictest Jews even refused to set foot in places containing heathen images. Rabbi Gamaliel the second (in the time of Hadrian) excused his visit to the bath of Aphrodite at Acco (Ptolemais) on the ground that the image of Aphrodite was there for the sake of the bath, not the bath for the sake of the image. The Essenes even refused to enter the cities, to avoid going through gates surmounted by statues, since they held it unlawful to walk beneath images. This reminds us of the fact that in Palestine (in towns where there was a heathen element, sometimes in the majority) the gates and other public buildings did not lack adornment; hence, even if the Jewish hatred

of images was able to prevent the exercise of the arts by Jews, it could not control foreigners, nor hinder the introduction of foreign works of art. Herod the Great adorned his magnificent buildings with sculptures, disregarding the reprobation of the orthodox. At the mouth of the harbour of Caesarea constructed by himself stood three colossal images, and in the temple of Augustus colossal statues of the emperor and the goddess Roma ; the gardens of his splendid palace at Jerusalem contained ponds full of brazen works of art from which the water spouted. At the outbreak of the Jewish war the palace of the tetrarch Herod Antipas in Tiberias was destroyed because of the images which offended against the law. At Caesarea Philippi several niches have been hewn in a wall of rock, which may formerly have contained images of the gods.

The plastic arts were sometimes employed in Palestine even on representations of living persons. The portraits of her children sent by the Princess Alexandra to Antony have already been mentioned. The death of King Agrippa (44) caused a brutal outburst of joy at Caesarea and Sebaste ; the soldiers dragged the statues of his three daughters (sixteen, ten, and six years old) on to the roofs of the brothels, and infamously insulted them. Publius Petronius, proconsul of Syria, when ordered by Caligula to set up his colossal statue in the temple at Jerusalem, sent for the most skilled artists from Phoenicia, and intrusted its execution to them ; the work was done at Sidon, the material being supplied by Petronius. After Agrippa had induced the emperor to abandon his intention, Caligula had a colossus of gilded bronze made in Rome, to avoid the disturbance which the transport of the statue from Sidon would have caused.

Some considerable portion of the works of art intended for the provinces may have been ordered and made in Rome, certainly for the buildings and artistic undertakings projected by the emperors, sometimes even for the use of the provincials themselves. At Trapezus (Trebizond) where Xenophon and the emperor Hadrian first saw the Euxine, Arrian found a statue of the latter erected in memory of his visit, with hand outstretched towards the sea. But as it was neither a good likeness nor well executed, Arrian begged the emperor to send another, more worthy of him, in the same attitude. In the

same place there was a beautiful temple of Mercury built of squared stones, containing a badly-executed statue of the god ; Arrian begged Hadrian to send a new one five feet high, and another of Philesius (a local hero descended from Hermes) four feet high. The statue of Victory, which in the year 61 was supposed to have turned round in the temple of Claudius at Camoludunum (Colchester), as well as the statue of the emperor himself, was no doubt sent from Rome to Britain. Sarcophagi found outside Rome, not only in Italy, but, e.g., one found in Crete (now in the Cambridge museum) are evidently of Roman workmanship. The facilities for transporting to Rome the products of gold, silver and copper mines and marble quarries by sea or on the Tiber (near whose harbour at the foot of the Aventine the marble storehouse of imperial Rome has been discovered in modern times) made it easy to execute works of art on a very large scale. We may suppose that there was a small army of artists and artisans, excellently organized with a view to co-operation, such as Hadrian took with him on his journeys, whose services were always at the emperor's disposal ; only on rare occasions, when some especially important or urgent work had to be carried out, was it necessary to employ artists from outside, as was done by Alexander Severus, when he ordered a large number of colossal statues, especially of the deified emperors. Sculptors' workshops, in which statues, heads complete and in outline, various kinds of marble, and sculptors' tools of all kinds have been found (when the foundations of the Chiesa nuova on Monte Giordano were being laid), were numerous in the ninth *regio* (between the *porticus* of Europa, the Circus agonalis, and the Via Recta) and without doubt in other places.

There are many indications that numbers of sculptors and stonemasons, who outlined and worked in the rough, or completed works of sculpture, were to be found in the marble and other quarries, which furnished material for statues. The discarded colossus of Apollo in Naxos (10·6 metres long) lies still incomplete in the marble quarries, from which it was chiselled. In Megara the highly prized and widespread 'Megarian sculptures' were made from the shell-marble quarried there. In the ancient Luna the production of works in marble of all kinds must have been far greater than in the modern Carrara, where in 1871 there were no less than 115 sculptors' workshops, and

3,000 of the 10,000 inhabitants (besides many foreigners) found employment in sculpture and marble work.

The account of the martyrdom of Claudius and his comrades under Diocletian affords interesting evidence of the making of sculptures in the quarries themselves. The author, who seems to have drawn upon oral tradition or the written memoranda of contemporaries or persons nearly contemporary, is well acquainted with Roman art as still practised on an extensive scale in the time of Diocletian, and thoroughly at home in its details and technical expressions. He was certainly acquainted with the locality of his narrative, the stone-quarries of Pan-*nonia* (probably near Mitrovitz on the spurs of the Frushka-Gora) and the works carried on there, in which perhaps he had himself taken part. His exact statements (especially of numbers) seem worthy of confidence. According to him, three kinds of stones were to be procured there, two kinds of marble for statues, resembling the Thasian (white) and Proconnesian (black and spotted with white) and so named, and a green porphyry; all three are still found there, as well as numerous ruins of Roman buildings. Six hundred and twenty-two stone-masons (*quadratarii*) worked under five heads of the technical department (*philosophi*); they were distributed in districts of mines (*officinae*), the subdivisions of which were called *loca*, and produced artistic and imposing sculptural works. By Diocletian's command a figure of the sun-god (25 feet high) with his four-in-hand was made of Thasian marble; columns and capitals, ornamented basins and slipper-baths of green porphyry, all perhaps intended for Diocletian's *thermae* at Rome. The work on a column with leafy capital, 'a wonderful piece of art', took three months, another only twenty-six days. The emperor's satisfaction with the work of the five Christian artists (Claudius and his four comrades) aroused the envy of the directors. As the Christians refused to make a statue of Aesculapius for Diocletian, the *philosophi* had one made of Proconnesian stone by other workmen in less than thirty days.

Images were, no doubt, kept in stock for sale in many places, chiefly in Greece and Asia Minor, which even in imperial times sent most artists to Rome, but probably also exported a considerable number of sculptures. The Alexandrian travellers in India, who put in at Cana in Arabia Felix, took statues as presents for the king of the country. In the romance

of Philostratus, Apollonius of Tyana meets in the Piraeus a ship sailing for Ionia, which its owner, a merchant, had freighted with valuable images of the gods, some of gold and marble, others of gold and ivory. Images and other objects [of worship were made not only to order, but also for merchants and brokers for trading purposes, as well as a considerable part of the works of art intended for decoration. The settlers in the Roman colonies of the Rhine and Danube countries could no doubt purchase in the shops ' of the dealers in bronze and clay figures ' all kinds of the little images (especially of Mercury and Hermes) so frequently found in those districts. The making of images of the gods was, and continued to be, the chief industry of plastic artists and artisans. This is shown by the fact that those who became Christians declared they could not abandon the work which was now a reproach to them, since they did not know how else they were to live. Further, they appealed to the making of the brazen serpent by Moses.

The mass of sarcophagi shows that they were made in factories, which is confirmed by the discovery of large numbers in the warehouses ready for sale, only waiting the final touches of the chisel when customers were found. The portrait medallions common in the centre frequently contain only the rough outlines of a face, to which the features of the deceased were afterwards added ; in like manner, space was left for the name below the superscription D.M. (*dis manibus*) found on all epitaphs. Lastly, many of the statues of honour, made as if in a mould, no doubt formed part of the stock of the sculptors' workshops. As in the case of the portrait medallions, the heads were not finished till the work was ordered, and the neck was hollowed out to receive special heads, as is shown by numerous examples. The heads and legs of statues in armour were frequently added by another hand.

But only part of the works of art could be made away from the place where they were to be set up or used. All the better personal memorials were made on the spot, and as a rule the finishing touch added even to the inferior. Similarly, artistic decorations (paintings, mosaics, stuccos) were mostly executed in the rooms they were intended to adorn. The rapid and enormous circulation of the imperial images cannot be adequately explained by their conveyance from a

number of different centres. Some of the artists and others who undertook great works of art, who possessed or hired workmen in all artistic departments, must have travelled from place to place. In the words of Goethe, 'whole colonies, expeditions, swarms, clouds, or whatever you please to call them, of artists and artisans were ordered where they were needed. Think of the hosts of masons and stone-masons, moving backwards and forwards through central Europe at that time, when a seriously religious mode of thought had spread over the Christian Church'. One of these wandering artists, Zeno of Aphrodisias, boasts in an inscription that he had passed through many cities relying on his art; statues in Syracuse and Rome, bearing the same name, are doubtless his work. A certain Novius Blaesus, according to the inscription on his grave, had adorned Rome and the empire with his statues; a worker in mosaic at Perinthus had exercised his art, in which he excelled all others, in all the cities of the empire. The fame of the artists spread rapidly as the result of their great achievements. Zenodorus, who had executed the colossal statue of Mercury for Clermont, was summoned by Nero to Rome, to perform the same service for him.

According to Lucian, however, in his *Dream*, the life of a sculptor, as compared with that of the wandering sophists, was a sedentary one, and no doubt in the more important towns there were settlements of artists in constant employment. This is established for the fourth century by the letter of Constantine to the governors of Spain, Gaul, and Britain in the year 337. The artists resident in the cities were ordered to be excused from undertaking work for the communities, that they might have time to learn their art thoroughly and instruct their sons in it; the artists specially named were architects, builders, painters, sculptors (as distinct from the makers of statues), and workers in mosaic (two classes). In the second-rate towns even there was no lack of sculptors' workshops, such as have been found in Thysdrus and Pompeii (not to mention Athens and Rome); in the latter tools for carving in stone, marble statues, herms, busts, tables with various legs, and an unfinished marble mortar have been discovered. In the other towns of Italy, and in the provinces (except Greece and Asia Minor) inscriptions relating to artists are not numerous.

Although art and artistic work were no doubt carried on in different parts of the empire by resident artists and their descendants (as is assumed in the rescript of Constantine), local and provincial styles and peculiarities can only exceptionally be recognized. The chief characteristic of the art of the imperial period is above all its uniformity in subject, conception, treatment, and technique, which is doubly striking when the wide extent of its operations is considered. Except in Gaul (especially Gallia Belgica) where art took a new and peculiar direction, and in Egypt, where the old national art held its ground, the artistic remains throughout the empire give the impression of homogeneousness. Any essential perceptible differences can be accounted for by the variety of the models imitated, the higher or lower state of development of art, the greater or less artistic skill of the artists. A mosaic, whether excavated in Tunis or England, in Andalusia or Salzburg, exhibits the same characteristics. An analysis of the painted stucco, of the wainscoting of Roman houses at Bignor in Sussex revealed to Sir Humphrey Davy the same colouring materials as in the painted stucco of the baths of Titus and the houses of Pompeii and Herculaneum; and the wall painting of the Roman villas in Gallia Belgica and in Pompeii not only exhibits the same decoration and technique, but the preparation of the plastering and the manner of laying on the colours are essentially similar. Everywhere stone-masons and sculptors worked according to Italian models. In the Echern valley near Hallstadt a Roman sepulchral memorial in the form of a gable has been discovered, representing a medallion portrait between a reclining female figure and a genius; there are similar monuments at Huesca in Aragon, in France, Italy and Dalmatia.

This uniformity can only be partly explained by the migrations of artists and the production of works of art for commercial purposes. Its chief cause was the finished development of Greek art at the time when it first entered into the service of Roman civilization. This development had been unprecedented. It had produced an immense wealth of form and ideas, and had brought to perfection a many-sided method of treatment and representation. Thanks to this heritage, a subsequent epoch, although it lacked creative power of its own, was able to exist for centuries without the appearance

of impoverishment. Persistent adherence to tradition, one of the chief differences between ancient and modern art, proved a double blessing to the people of that age. Instead of striving after an impossible originality and sacrificing the precious heritage of former days to fruitless experiments, recognizing its value they were shrewd enough to keep it intact for a considerable time. Art moved continuously within familiar limits and even new problems were solved in accordance with time-honoured laws. Thus, what at first sight appears inconceivable became possible. Art, even centuries after it was completely developed, maintained its eminent position ; at a time of real, though slow, decay sculpture could still produce works superior to most of the productions of modern plastic art ; and, in spite of its enormous productivity, a remnant of the nobility of the ancient forms survived even to the latest times of the empire.

Another cause of the uniformity of the art of the period was the levelling influence of Roman civilization. Rome was the model for the other cities of the empire in everything, but had the strongest claim to set the example in art. For in Rome 'works of art of every kind, of all ages and schools, carried off from Greece, Asia and Egypt, and stored in temples and public buildings, villas and palaces, provided inexhaustible material for education in art' ; in Rome the most important artists of the world foregathered, and the greatest works of art were executed ; Rome was a high school for art, the like of which had never been seen before. The provincials demanded imitations of all that was held in favour and esteem in the capital ; the Romans settled in the provinces for longer or shorter periods refused to be deprived entirely of the artistic luxury to which they were accustomed. The claims of both were satisfied by the services of a host of artists and artisans who poured into Rome from the provinces and back again ; thus, everything combined to set up a uniform fashion in art throughout the empire.

Decorative and religious art could fulfil their task for the most part by simple reproduction of what was already in existence, which also provided patterns and models for nearly all the subjects of monumental art. When simple repetition was insufficient, new ideas could be expressed by altering and developing the original motives, or the existing material

transformed into something apparently new by modifications and variations, by separating and combining. With this object, figures were detached from their natural connexion and used independently or combined with others, or originally independent figures were introduced into groups. It cannot be denied that this mode of procedure, which finds its obvious analogy in Roman poetry, produced many a work excellent in form and idea. Thus, for example, Venus looking at herself in the shield of Mars was changed into a goddess of victory recording victory on the shield ; she appears not merely as a statue, but in sarcophagus reliefs, in which very frequently figures, motives and groups are borrowed from older works and variously employed in new compositions. Also, she is grouped with Mars, embracing him in the arms with which she held the shield ; this attitude, a favourite one in imperial times, is repeated on sarcophagi and in four still existing statue groups. Similarly, a well-known and admirable group (Orestes and Electra) has been converted into an 'Orestes and Pylades', without sacrificing the composition and poetical motive. In the so-called *Thusnelda* in the Loggia de' Lanzi at Florence the credit of the highly-successful national characterization alone is due to the artist ; the magnificent design was borrowed by him from the mourning women of ancient art. Old forms were also very successfully used for images—rendered necessary by the introduction of new cults. The worship of Mithras did not spread in the West until the imperial period ; and in the reliefs of the Mithras caves we find only well-known forms, borrowed from the storehouse of Greek art. The god kneeling on the bull is nothing but a transformation of the goddess of victory sacrificing a bull ; similarly the other figures of this composition are borrowed, only the grouping and certain additional symbols being new. Josephus mentions another example of this method. In the temple of Augustus built by Herod at Caesarea the colossal statue of the emperor was an imitation of the Olympian Zeus of Phidias, 'not inferior to the original' ; that of Roma an imitation of the Hera of Polycletus at Argos. A whole series of imperial statues with the upper part of the body bare and a cloak wrapped round the thigh exhibits a more or less free imitation of the motive of the Phidian statue. In portrait statues, as already mentioned, the forms as a rule follow

older types. The so-called Pudicitia in the Vatican and the 'women of Herculaneum' belong to the large stock of female draped statues, the motives of which belong partly to the Attic art of the fourth century, and partly to the hellenistic period, and recur in a number of sepulchral statues.

But not merely was the exact reproduction of older works amply sufficient for decorative purposes ; it was also evidently the desire of the majority of art collectors to possess as faithful copies as possible of well-known and favourite figures. Lucian mentions the following statues (all, of course, copies) in the court of a private house at Athens ; the *discobolus* of Myron, the *diadumenus* of Polyclethus, the tyrannicides of Critias and Nesiotes. Naturally, the most famous works were most frequently reproduced. Thus, the still numerous reproductions of the Aphrodite, Faunus, and Apollo of Praxiteles and a number of others (e.g., the so-called Medicean Venus) are from originals for the most part unknown. Were not the inscriptions on the statues for the most part lost, we should probably know many of them. Thus, a Venus in the Chigi palace at Rome, according to the inscription, was copied by a certain Menophantus from an original in Alexandria Troas. These copies were circulated in all the provinces. At Soissons a group from the cycle of the Niobidae (the youngest son with his *paedagogus*), at Trèves a copy of the Venus of Milo and the Amazon of Mattei have been found. Juba II, King of Mauretania, who was educated at the court of Augustus and, like his wife, Cleopatra Selene (daughter of Antony and Cleopatra), took a keen interest in Greek literature and art, adorned his capital Yol (Zershel, afterwards Caesarea) with copies of work of the best period of Greek sculpture. Several of these have been found on the spot—two copies of a female statue of the time of Phidias, a child extracting a thorn from his foot, a Faun blowing a flute, a Venus as goddess of the sea. According to Josephus, King Agrippa adorned the whole city of Berytus in Phoenicia 'with statues and copies of older works', by which we must certainly understand the masterpieces of the most flourishing period of Greek art, although in Quintilian's time the fondness for the antique and even the incunabula of art, which greatly increased after Hadrian's time, gave rise to numerous imitations also of pre-Phidian plastic.

The sculptors, 'who copied old masterpieces indifferently

from any period whatever', undoubtedly in many cases directly served an artistic historical interest. Amongst the bronzes, which adorned the villa of the owner of the library at Herculaneum, only the portraits are modern, 'and even in their case only the realism of the heads, not the pose, nor the clothing. Everything else is a mere repetition of the works of earlier creative periods of art'. This complete dependence of art upon earlier ages is also manifest in other departments. Quintilian speaks of painters who confined themselves to copying foreign works as closely as possible; Lucian of free imitations and alterations of older pictures. Not merely the wall-paintings of Pompeii are in the main free imitations of artistic pictures, especially cabinets of the period of the Diadochi; but all the wall decoration of the so-called third and fourth style exhibits the after-effects of the fantastic splendour developed at the festivals of the Ptolemies. The preservation of mosaic floors in the most different provinces shows that here also the same subjects were everywhere repeated: Nereids and sea-monsters especially in baths, imitations of remains of meals in dining-rooms (so common that the name *asarotum* was used simply in the sense of 'mosaic'), busts of poets and sages in libraries and studies, and so forth.

In the adornment of utensils and objects in general use the same models were also continually reproduced, both in imitations by the hand of the artist and in the production on a large scale in factories. Zenodorus the bronze-founder copied two beakers chiselled by Calamis so perfectly, 'that there was hardly any difference as far as artistic excellence was concerned'. The representations on the silver vessels found at Hildesheim, Boscoreale and other places are reproductions of older models, chiefly Alexandrian. Gems, paste ornaments, and other productions in glass also show more or less successful copies of the same models. But the most numerous specimens are those of the potteries, so abundant throughout the empire, the product of an uncommonly rich and variously developed artistic industry (frieze tablets, frontal tiles, vessels with ornaments and figures in relief, and especially lamps) which spread the noblest and most pleasing inventions of Greek art to the farthest limits of Roman civilization. 'All this pottery is pressed in moulds, and its mechanical multiplication explains why the same forms, figures, reliefs, ornaments,

and potters' names are found repeated all over the empire—in Africa, Spain and Gaul, on the Thames, the Rhine and the Danube, and in Cilicia. But the Roman ware was only to a very small extent directly imported ; it was found more convenient to provide the potteries with moulds and stamps. This produced differences in what was to be executed on the spot, in the mixing and working of the clay, in colouring and varnish ; on the other hand, the result of mould and stamp was everywhere the same. It would not be difficult, with the aid of the clay ware found in different places, almost completely to reconstruct the stock of moulds and stamps in a well-assorted Roman pottery. But the frequently perverse combination of the single moulded pieces in provincial potteries betrays a lack of intelligence. In a number of these ornamentations the manner in which they have arisen can be easily traced. We are partly acquainted with the originals, single figures or groups, as masterpieces of art of independent importance, which were in vogue in Rome and consequently used for decorative purposes. We find them again on larger architectural members, metopes or frieze plates, on sculptured sarcophagus reliefs, and lastly on clay vessels. Thus Rome, by dictating the prevailing taste in art to the whole empire, put a certain share in the art treasures of the capital within the reach of even the poorer inhabitants of the province'.

Of the earlier ages, upon which the art of the imperial period, whose only originality consisted in the execution of portraits, was dependent, the hellenistic period exercised far greater influence than the classical (fifth and fourth centuries), an influence apparently due far more to Alexandrian than to Attic-Pergamene art. Similarly, Alexandrian poetry was the standard for Roman in its best period, and Alexandrian music exercised a decisive influence upon Roman. But artistic industry, even more than art proper, was benefited by the immensely wealthy tradition of the hellenistic epoch, which was still in a high degree creative ; its effects extended to the modest workshops of the potters, stonemasons, room painters, goldsmiths and silversmiths. Between art and the profession of art, for which there were no specially distinctive terms, there existed no hard and fast line in antiquity ; on the contrary, at a time when production was in the main reproduction, and the artist as a rule was only

required to develop or make use of foreign invention, they were closely connected at several points. Since also the artisan trained his eye and hand by first-class models, technical skill was sufficient to produce good imitations. Consequently the profession to a great extent conquered the field which in earlier times belonged to art proper, and developed on this soil to an extent only possible when a need which affected even the lowest orders had to be satisfied. The discovery of the room decorations in a second-rate town like Herculaneum was sufficient to effect a revolution in the already highly developed artistic industry of Paris. The taste for the new fashion (*à la grecque*, as it was called) increased enormously according to Galiani in the years 1763 and 1767. Goldsmiths, jewellers, carriage and door painters, upholsterers, and makers of ornaments found 'Pitture di Ercolano' indispensable.

But under the empire art was in many respects carried on not merely as a profession, but as a manufacturing industry. The erection of buildings and the execution of important artistic works were very frequently, if not as a rule, handed over to contractors, sometimes artists themselves, sometimes only employers of artists. According to Plutarch (as already mentioned) competition was invited for the erection of colossal statues, and the work was given to the candidate who promised the best work at the lowest price. An average standard of artistic ability was assumed in the case of every contractor; an unusually high standard was rare, being seldom required and little valued. Thus, the price and time required for the work were the chief factors in determining the selection of the artist.

The high and rich development of artistic handicraft, and the use of art for manufacturing purposes rendered necessary a highly specialized division of labour, of which many traces have survived. There were workmen who did nothing but put in the eyes (made of some coloured material) of statues. All the more important artistic undertakings assumed the co-operation of a considerable number of artists and artisans under individual direction. Thus, during the last days of Pompeii (after the earthquake of 63), the decorations of the walls of the houses ('where the ornamentations seemed the work of a single mind and out of the same paint pot') were

evidently for the most part, if not entirely, the work of one and the same society of painters. Painters of arabesques, flowers, animals, landscapes and figures worked at the same frescoes in succession or side by side ; since this was the only possible way of carrying out the work as promptly as was required. The fixedness of generally recognized norms and traditions, which relegated artistic individuality wholly or partially to the background, rendered the co-operation of two or more artists in the same work as common in antiquity as it is rare in modern times. In this respect there was apparently no change during the imperial period.

A great part of the workmen employed in the execution of more comprehensive artistic undertakings were slaves, and indeed slavery was essentially one of the factors on whose co-operation artistic production on a large scale depended. The artistic professions, whose productions perhaps satisfied the greatest part of the artistic need, could be learnt by any one who possessed a certain amount of cleverness and adaptability. Naturally, therefore, owners of slaves, who wanted to get as much out of them as possible, had them taught to make what was most in demand, amongst such things being works of art. Like bands of gladiators, troupes of actors, companies of singers and musicians, societies of painters and other artistic workers could be formed from large slave households, who were employed partly in decorating their masters' houses and partly in executing commissions on their account. Verres had a number of chasers and makers of metal vessels. Amongst the comforts of a modest but assured subsistence in old age, Naevolus in Juvenal hopes for ' a chaser in silver bent with stooping over his work, and another who is able rapidly to paint several faces ', i.e., slaves, who could increase his income by specially profitable work. The painter would be specially in demand for the representations of historical events which were profusely illustrated by figures, or for illustrations in books. Besides, painters most frequently belonged to the class of slaves, and were of course common in the imperial household. The jurist Julianus (under Hadrian) discussing the compensation for the death of a slave, expresses the opinion that if a ' valuable painter ' (*pretioso pictori*) gets his thumb cut off and he is killed within a year, the same value is to be put upon him as before his mutilation. In many cases

one of the conditions of the manumission of slaves trained in the same branch of art was that they should continue to work for their master in the arts they had learnt ; and amongst such arts that of painting is expressly mentioned.

The fact that works of art were in the main produced by slave labour and were generally in use made such labour cheap. But even free artisans were not too well paid. In the edict of Diocletian, the daily wage of the workmen who attended to the artistic decoration of houses is based upon the supposition that they, like the rest, received their board from the landlord. The pay of the stucco-worker is the same as that of the bricklayer, carpenter, lime-burner, carriage maker, baker and smith ; that of the mosaic worker is a sixth higher, that of the clay and stucco modeller half as much again, that of the portrait painter three times as high. The casting of statues in bronze was paid by the pound. In the case of statues, the result of their production on a large scale was a great lowering of price. In the time of Alexander the Great 3,000 drachmae (£118) seems to have been the usual price for a statue ; whereas Dio of Prusa in his Rhodian speech says that a (bronze) statue could be erected for 1,000 (£39) or even 500 (£19 10s.). Abundant evidence from inscriptions proves that this low estimate is not far from the truth. On several statues of gods and emperors from Gaul, Switzerland, Spain and Africa the prices, ranging (according to size, work and material) from 3,000 to 20,000 sesterces (£32 15s. to £217 10s.) and above, are given on the still extant pedestals. Probably in factories and shops the price of the different kinds of statues was fixed for customers and those who gave commissions. When a provincial priest from Baetica, who at the same time had filled the office of *duumvir* in his native Corduba, in recognition of the honours bestowed upon him caused statues to be erected there at a total cost of 400,000 sesterces (£4,350) they were 20 to 133 in number ; when a freedman of Assisi, an oculist, who was also *sevir* of the Augustales, gave 30,000 sesterces (£326) for setting up statues in the temple of Hercules, they could at most have numbered ten ; and the legacy left by an equestrian officer of Grenoble (50,000 sesterces, £548) 'for statues' would have sufficed at most for sixteen.

We know little of the fees, properly so called, paid to artists. Lucullus commissioned his friend the sculptor Arcesilaus

to execute a statue of the goddess Felicitas for 60,000 sesterces (£526), but the death of both prevented the completion of the work. The same artist sold Octavius, a Roman knight, the plaster model of a bowl for a talent (£235 15s.). Unfortunately, Suetonius does not mention the high fee paid by Vespasian for the restoration of the Venus of Apelles and the colossus of Nero. Zenodorus received from the capital of the Arverni (mod. Clermont) 400,000 sesterces in fees alone (*manupretium*) for his colossus of Mercury, on which he spent ten years.

These fees appear by no means small, even if the intrinsic value of money at that time is reckoned no higher than at the present day; they are as large or larger than those paid to many of the most prominent artists of the eighteenth and nineteenth centuries. The two hunting and fishing groups, ordered by Louis XV from Adam the elder for the gardens at Choisy and subsequently presented by him to Frederic the Great, cost (in 1756) 52,000 *livres* (about 160,000 *francs*); a figure of Abundantia by the same artist for the château of Choisy (in 1758) 10,000 *livres*. Bouchardon's famous 'Amor, breaking up the club of Hercules to make arrows' fetched the enormous sum of 20,000 *livres*. Pigalle, who had received 24,000 *livres* for an amor in 1750, undertook the memorial of Marshal Saxe in the church of St. Thomas at Strasburg for 85,000 *livres* (about 300,000 *francs*), which was paid in four instalments, although the work was not completed till the reign of Louis XVI.

Rietschel received a fee of 16,500 marks (£825) for the group of Goethe and Schiller at Weimar, on which he spent three years; his expenses amounted to 4,800 (£240). Consequently when at the height of his fame he did not make on the average much more than 3,900 marks (£195) a year, not half as much as Zenodorus in a provincial city, even assuming the same intrinsic value of money for the first and the nineteenth centuries. For the model of the eight feet statue of Kant at Königsberg (the brass for which cost more than 10,000 marks) Rauch received 6,000 marks, not much more than the fee of Arcesilaus for the model of the bowl.

(e) The Artists

The extent to which art as a mechanical profession occupied the field of art proper, and the humble position of the

majority of those who practised both, could not fail to influence the estimation in which art was regarded by persons of education. Both these circumstances were bound to cause those who were not intelligent enough to understand the real nature of the two, to regard art and technical skill as more or less synonymous, and the true artist as merely a superior artisan. Certainly, those philosophers who, recognizing moral elevation as the only aim worthy of their aspirations, speak with contempt of artistic activity, do not mean to depreciate the fine arts as such. When Plutarch declares that no young man, who is inspired by noble sentiments, will ever desire to become a Phidias or a Polycletus after he has seen the Olympian Zeus or the Argive Hera, he is careful to add, 'any more than he will desire to become an Anacreon, a Philetas or an Archilochus, after he has read their poems. For whatever be the enjoyment caused by a graceful work, it does not necessarily make its author estimable'. These expressions of Plutarch by no means show (as has been argued) a contempt for artists as no better than ordinary artisans, but on the contrary put them on a level with the greatest poets. On the other hand Seneca, who looked upon the creations of art as objects of luxury, and refused them a place amongst the studies which trained the mind of the young to morality (grammar, music, geometry and astronomy), saw nothing but the artisan in the artist: 'while we adore idols, we despise those who fashion them'. In particular, the exclusive and exaggerated value attached to a literary and rhetorical education was combined with contempt for the fine arts and their professors. This certainly is Plutarch's point of view, when he puts not merely Alcamenes and Nesiotes, but even Ictinus in the same class as all those common people and artisans, who know nothing of oratory; and in the same spirit Lucian, a man of really artistic tastes, in his *Dream* introduces Sculpture as an uneducated, uncouth, horny-handed and dirty woman, while Rhetoric appears as a brilliant personality, who declares that even Polycletus and Phidias themselves must have appeared common artisans to the admirers of their works. Philostratus, who numbers poets, musicians, astronomers, and the best rhetoricians amongst the sages, at least consents to include painters and sculptors, together with sailors and countrymen, amongst the semi-sages, 'provided they follow the

Horae ; for even these arts approximate to wisdom '. According to Galen, the arts and sciences to be chiefly recommended when choosing a profession are medicine, rhetoric, music, geometry, arithmetic, reckoning, astronomy, grammar and jurisprudence ; to these a man may add, if he pleases, painting and the plastic art. Speaking generally, we may assume that artists, like the arts themselves, were more highly esteemed in the Greek than in the Roman world at that period.

Of the two figurative arts (pictorial or plastic representation), it is clear that the plastic, even during the period of Roman domination, was almost entirely in the hands of Greeks by birth or education. Virgil, with genuine Roman arrogance, declared that the nation which was destined to conquer and rule the world need not trouble to dispute the superiority of others in giving life to bronze and producing living features from marble. Of all the well-known sculptors of the Roman period very few (such as Coponius) could be considered Romans by birth. At Rome, during the last days of the republic as well as under the empire, it was Greeks (especially Athenians) and Greeks from Asia Minor who produced the most admired masterpieces, were engaged in the most important artistic undertakings, and received the largest fees. The statue of Venus Genetrix in the temple [dedicated by Julius Caesar in 46 was the work of Arcesilaus ; it was the Athenian Diogenes who adorned the pantheon of Agrippa with caryatides and statues ; the artists, generally working in pairs, who, according to Pliny, ' filled the imperial palaces with the most famous statues ', were all Greeks.

The case of painting was quite different. ' Thanks to their adherence to the ancient tradition of covering the walls with stucco the Italians early attained a certain skill in mural painting '. One reason why the Romans preferred painting to the plastic art was that it lent itself much better to the faithful and vivid representation of events. In ancient times painting was considered no disgrace to men of the highest birth. Thus, in 304 B.C., one of the Fabian gens decorated the temple of Salus with pictures, highly praised by Dionysius of Halicarnassus, which were in existence until the temple was burnt during the reign of Claudius. The surname Pictor became hereditary in the family of this Fabius. After the time of Pacuvius, whose life extends to the period of the Gracchi,

painting certainly was not practised by 'respectable people' to use the expression of Pliny. It is probable that the Roman artists gradually gave place to Greek, who were more highly educated and invaded the city in ever increasing numbers; the longer and more generally painting was practised by foreigners, slaves, and freedmen, the less honourable it was considered for Romans. Valerius Maximus considered it incomprehensible that a Fabius should have devoted himself to so low an occupation without being ashamed of it.

But still, painting was always thought more highly of than the plastic art, and even in imperial times it was never entirely in the hands of the Greeks. For painting Pliny was able to use a Roman monograph by one Fabius Vestalis and biographies of painters by Cornelius Nepos; for the plastic art his only Roman authorities were antiquarian and miscellaneous works and encyclopaedias. During the reign of Augustus a boy of distinguished family (Quintus Pedius) was brought up as a painter; but he was dumb, and all the professions suitable to his rank were closed to him. Certainly, Pliny saw some fine paintings at Verona by a Roman knight named Turpilius. Fabullus, a brilliant though serious painter, who only worked a few hours a day, standing on his scaffolding, always wearing his toga with a dignified air, was chiefly employed in Nero's Golden House. Cornelius Pinus and Attius Priscus painted the interior of the temple of Honos and Virtus restored by Vespasian. Under Augustus the Roman painter Ludius (or Sextus Tadius) introduced a hellenistic style of decoration, which enjoyed great vogue; the skilful manner in which he satisfied the demands of the luxury of the period, his keen observation, his humour and thorough acquaintance with the means of representation, stamp him as a genuinely Roman artist.

To judge from the frequent occurrence of female names on ancient paintings, women also appear to have practised the art to a considerable extent. In 1847 the tomb of a female artist was discovered at Saint Médard-des-Près in La Vendée near the remains of a villa, in which fragments of delightful frescoes were found. Besides the skeleton of the deceased, the tomb contained a rich assortment of painter's requisites. According to Justin Martyr, women also practised as sculptors. At least he mentions as a proof of the licentious-

ness of the makers of idols, that they seduced the female slaves who assisted them in their work. But perhaps they may only have been models whom he had seen in the workshops, whose relations with the artists caused him such offence. Further, the technique of sculpture, as of painting, persisted in the West also till the last days of antiquity.

Architecture is the only art in which the Romans showed any creative activity. Corresponding as it were to a national taste, it was the only art which could not only effectively promote the ambitious aims of the State and its universal dominion, but also adequately expressed the consciousness of its right to the empire of the world. While dependent upon Greek influence in all other departments of art, in architecture the Romans have created those absolutely original works which, in spite of thousands of years, even at the present day, produce an effect so powerful and 'almost stupefying'—works with which Greek art has nothing to compare. When Frontinus proudly asks whether the inert masses of the Egyptian pyramids or the useless splendour of the famous Greek buildings can be compared with the Roman aqueducts, he is merely giving expression to a point of view, which although partial is not without justification.

The absolute necessity and the high importance of architecture in public as well as private life explain why it was considered the most respectable of all arts, and placed by Cicero on a level with the profession of medicine. Probably it was the most lucrative art, not only in Rome but in all the large towns of the empire, and consequently overcrowded. In the ranks of architects Roman citizens were found by the side of slaves, freedmen and foreigners in republican as well as imperial times. The work of Vitruvius on architecture was not the first Roman treatise on the subject. Of the famous imperial architects known to us, the only one of whom it can be affirmed with certainty that he was not a Roman is Apollodorus of Damascus, who superintended Trajan's buildings, and in 101 constructed the bridge over the Danube. Tacitus mentions as Nero's architects Severus and Celer (perhaps an imperial freedman), 'who possessed sufficient talent and boldness to attempt what Nature appeared to refuse'. Domitian's palace was built by Rabirius, who, according to Martial, had taken the starry heavens as a worthy model; Hadrian's

architect Decrianus was certainly a Roman. Pliny the Younger intrusted the building of a temple of Ceres to a certain Mustius, who skilfully surmounted the difficulties of the ground. The constructor of the bridge of Alcantara and an imperial temple connected with it on a rock near the Tagus is known to us from some verses hewn in stone, according to which, 'this bridge, which will stand as long as the universe shall last, was built by Lacer, famous for his divine art'. The name of the builder of the Pont du Gard, according to an inscription discovered on the spot, was Veranius; on an arch at Antipolis (Antibes) Sextus Julius (his third name is mutilated) is named as its constructor. Even in the eastern provinces buildings were constructed by Roman architects. Costunius Rufinus built the temple of Zeus Asclepius at Pergamus, while Galen (after 147) was studying there under Satyrus; the name of this architect was known even in Byzantine times, and the temple was considered one of the wonders of the world.

(f) *Artistic Feeling*

A comparatively small number of the many thousands of artists, who exercised their craft during the early centuries throughout the empire, are known to us by name, and nearly all of these only from their own inscriptions on their works. Notwithstanding the frequent allusions to artistic undertakings of all kinds the artists who carried them out are hardly ever mentioned. This is partly to be explained by the subordinate position held by artists in society, and also by the fact that artistic production was far more frequently the work of associations than of individuals, who being merely the instruments of a corporation were held in little regard. On the other hand, as already shown, the arts were not regarded as important and valuable for Roman civilization in themselves, but only so far as they were indispensable means to the attainment of ends universally and persistently kept in view. Lastly, the artistic production of that age appeared less important to contemporaries than it does to us, since they measured it by the standard of the creations of the Greek art at its best. At a time when works of the period from Phidias to Lysippus were so common, the lack of originality, the exaltation of the formal over the intellectual element, even in the most brilliant, imposing and graceful productions, could not

fail to strike all, even the least intelligent, who saw the two side by side. It is easy to understand why interest in art was by preference directed towards the past. But even then its nature and intensity were by no means identical in the Roman and Greek world; rather, this is just one of the departments in which the diversity of the two civilizations can be best appreciated even by us.

The victorious campaigns of the Romans in Greek countries after the conquest of Syracuse (212), and the spoils accumulated by generals, governors and emperors for two centuries and a half down to the time of Nero, filled Rome even to excess with an incredible number of the most perfect Greek works of art. The impression created by this incomparable collection of masterpieces, which attracted even the indifferent and hostile, was supplemented by the journeys in Greece undertaken with increasing frequency for pleasure or instruction by the Romans after the conquest of Corinth. Lastly, the Romans found their attention in many ways directed towards the fine arts by Greek literature, which more and more came to be recognized as the basis of all higher culture. Certainly, there is nothing to show that the original Greek works on the subject, which Pliny has utilized in his description of the world, were much read by the Romans. On the other hand, the epigrammatic and rhetorical literature of the Greeks contributed to spread a knowledge and criticism of art. The Greek specialists in the theory of oratory, whose writings were continually used and consulted by the Romans as authorities and guides in this science which dominated their entire educational system, were fond of comparing the development and various styles of oratory with those of the fine arts, and borrowed many technical artistic expressions for the terminology of rhetoric, which were adopted and circulated by the Roman writers on the art of oratory. Then, epigrammatic poetry, specially cultivated in Greece after the time of Alexander the Great, showed a marked predilection for the fine arts, and attempted to reproduce, by witticisms and badinage, the impression created by important works. Many of these poets, during the last days of the republic and the early empire, visited Rome, where they found inexhaustible material and ever fresh incitement to this sort of poetry in miniature; and we can easily understand how the Romans, who had little

time and still less taste for artistic studies, gladly embraced the opportunity of obtaining, without any trouble to themselves, information about much discussed works by the aid of these brief and characteristic judgments, whether really or only apparently appropriate, which were passed on from one to another by word of mouth. The criticisms in matters of art which we find in Pliny, nearly all taken from these Greek epigrams, show that this was no uncommon occurrence ; it is possible that Pliny found a ready-made collection of them in the work of the sculptor Pasitales on the most celebrated masterpieces of art in the world.

One of Varro's chief works shows that the Romans already recognized in the fine arts a very important element of universal civilization. Certainly, in his encyclopaedia, which treated of the nine chief arts and sciences, he has only given a place to architecture ; but in his collection of 700 portraits of famous men bearing their signatures, he admitted painters and sculptors to the company of kings, generals, statesmen, poets, writers, savants, and architects. This, like all Varro's works, exercised a great influence upon education in general, in later times as well as his own. Lucretius also includes paintings and the plastic art, as well as poetry, amongst the acquisitions of an advanced civilization, which gave charm to life. The detailed consideration of the history of art and artists, given in Pliny the elder's description of the world (written more than a century later) gives us reason to assume an increased interest in such things in educated Roman circles, the more so as the author himself was quite ignorant of artistic matters.

We do not know how far Varro's demand, that young girls should be taught painting, was realized ; but amongst the female painters whose names often occur on pictures there may probably have been some amateurs. The example of Aemilius Paulus, who allowed his sons to receive instruction from Greek painters and sculptors, may well have found imitators even in imperial times in the circles where a Greek education was specially favoured. In his early years Nero assiduously handled the paint-brush and modeller's stick. Hadrian also zealously devoted himself to these two arts, and even when emperor dabbled in painting. Marcus Aurelius was instructed in the same art by the Greek Diognetus, who seems also to have been a philosopher and in other respects to have influ-

enced his education. Alexander Severus, whose education was entirely Greek, 'was an excellent painter'; Elagabalus (Heliogabalus) also practised this art, and Valentinian was an amateur painter and sculptor. Although the case of two emperors brought up in Syria proves nothing about education at Rome, yet the number of royal artists is sufficiently large to allow us to assume that the instruction of the young in the fine arts and the resulting dilettantism of their later life, was by no means uncommon among the upper classes of the capital at all times. It is equally clear that this dilettantism was by no means looked upon as objectionable in itself. If Titedius Labeo (proconsul of Narbonensis) was ridiculed, and even insulted, for boasting about his skill in small panel pictures, it was not his dilettantism, but his ostentatious parade of it, that gave offence. However, if we compare these few instances of Roman dilettantism in the fine arts with the numerous proofs of their dilettantism in music, we obtain the impression that the former was by far less common than the latter.

Naturally, the Romans, when travelling for pleasure or instruction (especially in Greece and Asia Minor) did not fail to inspect the works of art, especially those which a fairly well-read man might be expected to know at least by reputation. They were even made the object of special journeys. But there is nothing to show that this interest in art was anything more than a superficial curiosity concerned with externalities, being chiefly aroused by the celebrity of the work and the artist. These journeys were mainly undertaken from historical interest, and the majority of the travellers no doubt felt, like Atticus, that even the splendour of the incomparable masterpieces of Athens was less attractive than their historical reminiscences. The accumulation of works of art by private persons at Rome is no proof of a wide-spread artistic feeling. The mere knowledge of their expensiveness was sufficient to make even those who had no more idea of their value than the uncultured conqueror of Corinth regard them as desirable spoil; and the store of works of art in Greek countries was inexhaustible enough to satisfy the greed of the Romans to the full. In course of time, marble columns, carpets, tables of citrus wood, silver ware, magnificent vessels, statues, and paintings were considered indispensable for the decoration of the houses and villas of the rich. No special amateurism

was needed to form collections, so enormous was the supply of works of art and so great the facilities for acquiring them or obtaining them by plunder. By the time of Augustus picture galleries were so common that in Vitruvius's plan of a great house a large hall towards the north for this purpose was considered indispensable; in later times, collections of sculptures also became general.

If these collections also contained works of living artists, they are never mentioned; and even if they did not consist for the most part of old pictures and statues, these were at least regarded as the most valuable, if not the only valuable part of the collection. It is often expressly stated that amateurs and collectors, such as Julius Caesar and Damasippus, who had a mania for collecting old statues, were specially anxious to procure them. Picture galleries, says Pliny, are stuffed with old pictures. In the case of silver ware special regard was had to antiquity, almost the only criterion of value of the works of an almost vanished art; carved work, which was worn almost beyond recognition, was prized above all. Some antiquarians even preferred the incunabula of art—the 'almost coarse' pictures of an Aglaophon and a Polygnotus to those of later artists, according to Quintilian, who with justice charges them with parading their superior knowledge of art. Augustus had a preference for the affectedly antique productions of Bupalus and Athenis of Chios (sixth century), and set up statues of both on the pediment of the temple of Apollo on the Palatine and in nearly all the other temples erected by him in Rome. This taste seems to have been most general during the reign of Hadrian. Generally speaking, however, 'ancient works of art' meant those of Greek art at its best or even of the period of the Diadochi. The authors of the 'works of the ancients', which Statius saw in the villa of Manilius Vopiscus at Tibur, are not mentioned by name; among the old pictures and paintings in the villa of Pollius Felix at Sorrentum were works by Apelles, Phidias (early period), Polycletus and Myron; in the collection of 'ancient works' belonging to Novius Vindex there were bronzes by Myron and Polycletus, marble sculptures by Praxiteles, ivory carvings by Phidias, and pictures in which the touch of 'the old Apelles' could be recognized. The names, thus casually mentioned, are nearly always those of artists of the first rank,

especially Polycletus. In Juvenal, when a rich man's house is burnt down, one of his friends who have clubbed together to furnish a new one, brings 'something exquisite' by Euphranor and Polycletus. In fact, the latter was considered by many the first among artists, the master in the representation of youthful beauty, who 'never ventured beyond beardless cheeks', whose works were distinguished for perfection of form more than depth of conception. Next to him, Myron is perhaps most frequently mentioned, whose figures of men and animals were especially impressive from their truthfulness to nature; more of their work was to be seen at Rome than of that of Phidias, whose masterpieces remained in Greece. Vitruvius calls them both representatives of the plastic art, as Apelles of painting. Artists of the times subsequent to Alexander the Great or the last days of the republic, amongst whom Pasitales and Arcesilaus were prominent, are practically never included among the 'old masters'. On the one hand, the accumulation by private persons of reputed ancient works of art, such as that of Domitius Tullus which filled a huge park, and the bandying about of the most famous names; on the other, the technical excellence of the art of that period and the great activity with which it reproduced antique and classical works, make it almost certain that collectors were often deceived by artists and dealers, and purchased copies instead of originals. Martial says of some one who boasted of his original paintings and real silver-goblets, that his friends were just as genuine as his collection. For the early empire we have express testimony that such forgeries were frequent and notorious. The fabulist Phaedrus says that, if he borrows the name of Aesop, it is only to enhance the value of his wares, 'after the manner of many artists of our time, who inscribe the name of Praxiteles on their new marbles, or that of Myron on polished silver, or that of Pausias on a picture. Thus spiteful envy always exalts counterfeit antiquity above contemporary excellence'. A Greek author under Hadrian states that Phidias had allowed his favourite Agoracritus to pass himself off as the author of the Rhamnusian Nemesis by means of an inscription on the statue, and adds: 'in like manner many others have inscribed some one else's name on their works'.

Mention in the literature of the period of works by great artists, of which nothing further is known, should be received

with caution. It is certainly possible that a vase with fishes carved in relief, a cicada, a bee, and a fly by Phidias were in existence, but we cannot believe it on the mere statement of Martial (which admits of another interpretation) or of the Emperor Julian. Work in precious metals (the toreutic art and *caelatura*) was 'one of the chief fields of artistic fraud', since the furnishing of sideboards with 'old' silver ware and of collections with 'original goblets' was the favourite artistic luxury. But the flourishing period of the toreutic art was brief, the number of famous artists small. The only authentic work with which Mentor, the greatest of them, the Benvenuto Cellini of antiquity, was credited by connoisseurs, was four pairs of cups. In shops and collections, on the other hand, they seem to have been by no means uncommon. Martial describes a shop dealing in costly *objets de luxe*, where, besides statues by Polyclethus, 'cups ennobled by the hand of Mentor' were procurable; and he regularly uses this name when speaking of old original works in silver. Although connoisseurs could only be deceived by good copies (such as those of Zenodorus after Calamis), there were doubtless many amateurs and collectors of the stamp of Trimalchio in Petronius, who had a special fancy for silver work and owned cups on which was represented 'the slaying of her sons by Cassandra, the dead boys lying so naturally that you would think they were real; and the shutting up of Niobe in the Trojan horse by Daedalus' (Medea slaying her children and the cow of Pasiphaë being really intended). He concludes the catalogue of his plate with the remark that it was all very massive. The passion for bronze works, especially of Corinthian bronze (the mixing of which was a lost secret), was almost as great. Nevertheless, there were always artists ready to produce work of this material, who probably often deceived connoisseurs, although they pretended to be able to recognize the genuine article by the smell.

It is certainly no mere accident that stress is so often laid upon externalities (such as antiquity, rarity, expensive material) in accounts of the artistic collections of the period; no doubt a great part of the collectors attached supreme importance to those qualities which they could most easily appreciate. Historical interest may also have been taken into consideration in various ways. Objects which had belonged to famous persons were much sought after and commanded a

high price : the earthen lamp of Epictetus 3,000 drachmae, the staff of Peregrinus Proteus a talent. The value of the diamond, presented to the beautiful Jewish princess Berenice by her brother Agrippa II, was enhanced by her having worn it on her finger. When Caligula put up certain imperial jewels to auction, the fact that they had belonged to Germanicus or Agrippina, Antony or Augustus, was taken into consideration in fixing the price for those who were forced to purchase, whether they wanted to do so or not. At the banquets of the rich the guests had not merely to convince themselves of the weight of the silver by lifting it, but had also to listen to a detailed history of every article. Juvenal describes a shipwreck, in which some chased silver vessels were thrown overboard, which were said to have been used by Philip of Macedon. Caracalla had some weapons and drinking vessels, which had belonged to Alexander the Great, the object of his special reverence. Martial, who when it was necessary knew how to treat such relics as a plank from the ship *Argo* with respectful awe, could not endure being forced to listen at table to 'the smoke-begrimed genealogies' of the silver cups placed before the guests, which were supposed to have originally belonged to Nestor, Achilles or Dido. In the case of pictures and sculptures also, the spectators probably had to listen to their early history. The little *Hercules* by Lysippus in the collection of Novius Vindex was said to have been in the possession of Alexander the Great, Hannibal and Sulla.

Probably collectors, more than any others, laid claim to being connoisseurs, and Trimalchio declares that he would not sell his artistic judgment at any price. Yet, as at all times, pretension was commoner than real knowledge. Dionysius of Halicarnassus, who knew more about art than most Romans, seems only to have credited experienced artists with the capacity for settling the authorship of anonymous works and distinguishing copies from originals ; however, according to Statius, Novius Vindex possessed the first to a remarkable degree. Damasippus, as Horace makes him say, had devoted himself to testing the genuineness of Corinthian bronze, to judging defects in sculpture or roughness in casting, to putting prices on statues ; the latter quality stamps him as a connoisseur, for then as now connoisseurs were fond of parading their expert knowledge by valuing works of art. Of course, they

were always talking about 'mixing of bronze', 'contours', 'shading', 'proportions' and the like, of which laymen confessed themselves ignorant; for it was generally recognized that special training was requisite in judging works of art.

Naturally, the amateurs and enthusiasts, who are frequently mentioned and set down as fools from the Stoic as well as the strictly Roman point of view, far outnumbered the connoisseurs. The opponents of Greek culture had already reproached Marcellus with having led his countrymen into the evil habit of wasting time in artistic gossip, the result of the plunder of Syracuse. Slaves (especially Greek), who had the opportunity of examining the abundant stores of art in Rome, often neglected their duties; at any rate, the jurist Venuleius, in enumerating the faults of slaves, which a seller is bound to point out, mentions as mental defects, together with the mania for shows and a propensity to lying, a mania for incessantly gazing at pictures.

Thus, neither the enormous art collections of the Romans nor the wholesale employment of art for decorations and monuments prove the spread of any real artistic feeling. The accumulation of ancient works of art was only a form of Roman love of splendour, which with all its magnificence had something barbaric about it; the lords of the world aimed at possessing and enjoying, as far as was possible, all the precious things of the world, and at surrounding themselves with everything that could impart magnificence and splendour to life. Hence they dragged off to Rome the most famous works in all branches of art, but their appropriation of these treasures was only material. It was just the multitude of the impressions that dulled their effect, as Pliny rightly recognized, the more so as quietness and silence, indispensable to artistic contemplation, were impossible amidst the restless stress and movement of Rome. Very few had time to become absorbed in works of art; the majority were content to acquire a hasty and superficial knowledge of them. Tacitus, by way of characterizing the prevalent indifference to poetry, says that any one who had once seen a famous poet was satisfied and went his way, as if he had just seen a statue or picture.

As a matter of fact, notwithstanding all the new and old artistic splendour of Rome and the Empire, the fine arts never exercised any influence over the general progress of

Roman civilization ; Roman literature, regarded as a whole, provides an unexceptionable and irrefutable proof of this. Of the numerous poets and literary men of different periods, many of whom, the chief lights of their age, may fairly be regarded by us as its worthy representatives, there is hardly one who displays any interest in or knowledge of the fine arts. This varied literature, extending over centuries, and coming into contact in all directions with all important interests, during the first centuries of the Christian era is almost exclusively directed to the consideration of the present. Distributing alike praise and blame in its examination of the intellectual conditions of the age, it shows no trace of an appreciation of what really constitutes the essence of art, no expression of genuine emotion caused by its masterpieces. Wherever art is mentioned, it is spoken of unintelligently and contemptuously, or without sympathy or warmth. Although many individual Romans may have penetrated the nature of Greek art, on the whole it has always remained unknown and alien to Roman civilization.

If there still remained any doubt, whether the impression produced by Roman literature as a whole definitely proves the absence of artistic feeling amongst the Romans, such doubt is removed by a comparison of contemporary Greek literature. The sympathy and intelligence lacking in the one are unquestionably to be found in the other ; it is obvious that in this department the contrast between Greek and Roman civilization is uncompromisingly maintained. The ever lively national feeling of the Greeks would of itself lead us to expect that their attitude towards these creations of their great past would be far more sympathetic than that of the Romans.

While Tacitus believes that he can best indicate a superficial and cursory knowledge by comparing it with the contemplation of works of art, Plutarch laments that the 'majority' regarded an absorbed contemplation of objects of art more important than reflection upon their own lives. 'The majority believe', as Arcesilaus said, 'that we must closely examine poems, pictures and statues and review all their details in the mind and with the eyes, while leaving unheeded our own life, which offers many by no means unattractive subjects for contemplation'. All the remarks of Dionysius of Halicarnassus show independent criticism of painting and

sculpture ; on the other hand, the judgments of Roman writers upon eloquence in their comparisons of the art of oratory with the fine arts are evidently borrowed from books, and even the tasteful and refined Quintilian at times betrays a certain hesitation on this subject. To explain his remark that natural gifts can do much without culture, the latter nothing without the former, he makes the following comparison : had Praxiteles attempted to carve a statue out of a millstone, I should have preferred an unhewn block of Parian marble ; but had the artist completed a work from the latter, its value would consist more in his work than in the marble. Consequently, he considered a good material more valuable than work done with bad material by a good artist. A later Greek historian Memnon (in the history of his native town Heraclea on the Euxine) describes in detail the attributes of a statue of Hercules carried away from there by Aurelius Cotta (club, lion's skin, bow and quiver), 'executed, in beauty of proportion, grace and technical skill, in a style inferior to none of the most valued works'. A Roman writer would hardly have spoken so enthusiastically of such a subject even in the most detailed description. In his account of the fire under Nero, Tacitus mentions the loss of numerous Greek masterpieces in two words, Suetonius not at all. And when Herodian compares the youthful Elagabalus (Heliogabalus) with the beautiful statues of the youthful Dionysus in beauty, youthful bloom and delicacy of form, it cannot be considered as accidental that no such comparison is to be found in any Roman historian. In Plutarch's treatise on the famous men of Athens its painters are spoken of at length ; the section on sculptors is lost. Also in Greek geographical works, amongst the things for which individual places are noteworthy, their works of art and native artists, even such as were little known, are included. The dry, meagre, and external notices of works of art in Pausanias certainly do not show any love or knowledge of art, and even the affected enthusiasm in the descriptions of the Philostrati says nothing for the artistic feeling of the authors. Works of art such as scenes from nature, were just the subjects on which the stylists loved to display their learning. Art and nature aroused the interest of the sophists, both Greek and Roman, not for what they were in themselves, but only so far as they afforded an opportunity of exhibiting

their literary skill. The same remarks are applicable to the descriptions of nature and art in Apuleius as to those of his Greek models.

What a difference there is between this painfully elaborated enthusiasm and the language, full of warmth and feeling, which the irresistible effect of the statue of Olympian Zeus inspired in Dio of Prusa ! The sight of this masterpiece, he declares, would astound even irrational creatures, and no man, however miserable and overwhelmed with sorrow he might be, could help forgetting in the presence of this image all the terrors and burdens of life ; such light and grace has art bestowed upon it ! The criticism of this ideal of Zeus, which he puts into the mouth of Phidias, 'the wise and marvellous author of this magnificent work', the friend and companion of Pericles, expresses a lofty idea of the importance and power of representation of the fine arts, combined with an admirable and in many respects striking appreciation of the difference between art and poetry. Lucian, finally, of all the writers of antiquity shows the most comprehensive knowledge and the most thorough understanding of art ; his judgment is always independent, his taste follows the best models, his talent for characterizing works of art by a few features, or reproducing their effect in an enthusiastic description, is no ordinary one, as is shown in particular in his description of the Aphrodite of Cnidus by Praxiteles. For the rest, Lucian's interest also was almost exclusively directed towards the most flourishing period of Greek art ; the keener his eye became, the less worthy of his attention did the productions of later ages appear. In the same spirit Galen declares that the inferior education of his time and the fact that wealth was more highly prized than virtue, explained how it was that there were no masters such as Phidias among sculptors, Apelles among painters, or Hippocrates among physicians. Thus also Aristides calls those the greatest masters, who reached the highest by going beyond earlier art and made their predecessors seem children in comparison with them.

If, then, contemporary art is treated with no more consideration in the Greek literature of the imperial period than in Roman, the causes of this phenomenon are diametrically opposite in the two cases. Measured by the high standard set by the true artistic feeling of the Greeks, its value might easily

be underrated ; whereas the Romans, who in general had no idea of the real and independent value of art, regarded it only as one means amongst others of refining the enjoyments of life and of perpetuating the memory of persons and things. If we only possessed the two literatures, we should have no idea of what the fine arts even then were capable of producing, nor of the astonishing extent to which the need of artistic ornamentation and monumental representation had pervaded all classes of society, nor the enormous development of activity which it called forth in sculpture and painting. Yet how rich was this civilization, which was accustomed to dispose of the productions of art to an extent inconceivable to the modern world, which reckoned amongst the least of its possessions and carelessly scattered broadcast those treasures, whose immensity humiliates and fills us with astonishment !

II. MUSIC

Like every people whose organization is sufficiently advanced, the Romans had their own music and song from the earliest times ; but their modest instruments and doubtless simple melodies were reduced to silence, in the temples and on the stage, by the richer and more artistic sounds of Greek music. In the face of this art, introduced from without in a high stage of development, the native art was unable to hold its ground. In vain the old Roman party, hostile to everything that came from abroad, succeeded in 115 B.C., in passing a measure to prohibit the use of all musical instruments, except the Italian short flute with a few holes. Roman music, as an art in the highest sense, never existed, only Greek music transferred to Roman soil.

The art which the Romans took over from the Greeks was essentially different from modern music, and being less independent and completely subordinate to poetry, with which it was far more intimately connected than our own, it never possessed its importance. Musical recitative was an indispensable element of artistic form for most kinds of poetry, even those which according to modern ideas are entirely excluded from the domain of musical composition. Juvenal defines a poet as one who combines the eloquence of words with the harmonies of music.

It is well known that ancient tragedy and comedy resembled our opera and vaudeville far more than our ordinary plays. The Roman drama, in addition to spoken scenes, included musical interludes (*Cantica*) sung to the flute, melodramatic and recitative, as well as choral scenes properly so called ; it was usually preceded by an overture. All lyric poetry was intended to be set to music and accompanied by stringed instruments ; it was, in fact, regarded as ' songs written for the lyre ', especially choral, for whenever possible they were executed by choruses. This applies not only to the odes of the Greek lyric poets, such as Anacreon, Sappho and Alcaeus, which to all appearance were frequently chanted in imperial times, but also to those of Horace, which he himself calls ' words to be associated with the strings of the lyre ' ; and since there can be no doubt that they were intended to be sung with instrumental accompaniment, in spite of the absence of positive testimony we may assume that they were. Aristides was directed by Aesculapius in a dream to devote himself to songs and poetry, to learn music and to keep boys for the purpose ; also at the bidding of the god (and of Minerva) he composed paeans and hymns on different gods, which were sung by his boys. Now, if the hendecasyllables of the Younger Pliny were sung to the accompaniment of the lyre and cithara, we may believe the same of the hendecasyllables of Catullus. There is express testimony of the musical recital of elegiac poetry to the accompaniment of flutes in earlier times ; this was the case with the paraenetic elegies of Theognis, who states that young men would sing the name of Cynos to the notes of the short flute ; the elegies of Mimnermus, Phocylides and Tyrtæus were similarly treated. Ovid expresses the hope that his *Heroides* may be sung in the future by a skilled vocalist. Gellius describes a banquet given in the country near Rome by a young and wealthy musical friend, a native of Asia Minor. He kept excellent choirs of girls and boys, who after dinner sang ' in a pleasing manner ' to the accompaniment of the cithara several poems of Anacreon and Sappho and graceful love elegies of more modern poets. ' The verses of the poet and composer Seikilos, chiselled on his tomb at Aidin with musical notes and rhythmical marks over them, are Anacreontic in style '. If elegiac distichs were also sung at that time, the recitation at the same banquet of distichs of the

old Roman poets, Valerius Aedituus, Porcius Licinus and Quintus Catulus by the rhetor Julianus must also have been real song ; but as the old song, essentially a recitative, approximated more or less to declamation, the words *canere* (sing) and *dicere* (speak) could be used alternately and indifferently. The positive statement that Virgil's idylls were recited on the stage by singers is to be literally understood. Such recitations were often accompanied by rhythmic gestures, so that the execution was partly operatic, partly dumb show. Ovid in exile was cheered by the news that his poems were often 'danced' on the stage amidst applause. Although we know nothing definite about this mode of representation, the analogy of pantomimes renders it probable that the text (e.g., of the *Heroides*) was sung by a sort of chorus, while a dancer expressed the action in dumb show. And when we read of the epics of Virgil and Homer being 'sung', the word is probably to be taken literally, song in this case approximating more closely to recitation than in other classes of poetry.

In the middle ages also, the connexion between poetry and music was for a long time most intimate. The French *jongleurs* of the twelfth and thirteenth centuries sang their romances to the accompaniment of the three-stringed Arabic violin. In Germany, as in France, 'a distinction between "singing" and "speaking," between musical execution and recitation of poems was only gradually established. Song and instrumental music were usually combined, and the court poet had to invent not merely the words but also the melody, which he accompanied on the harp, the fiddle, or the *Rotte* (a stringed instrument partaking of the nature of both)'. As late as the end of the sixteenth century the epics of Ariosto and Tasso were everywhere sung to the lute. The song of the Servians is rather 'speaking' than 'singing'; the monotonous sound of the *gusla*, which has only one string, is only heard at the end of the verse.

The extension of musical execution to nearly all forms of poetry in antiquity supposes a relation between words and music quite different from that of modern times. In modern lyrical compositions the text is in all cases subordinate to the music, whereas to a great extent in ancient vocal music the melody, like rhythm and metre, was only of secondary importance; its value consisted in the fidelity with which it was

adapted to the text. 'This is shown in particular by the newly discovered Delphic hymns'.¹

The Greek musical system was far less comprehensive than ours, and lacked its highest and deepest notes. Two octaves was regarded as the maximum range for the voice, which, however, as a rule preferred the single octave in which it was most successful ('the Delphic hymns, hellenistic in their technique, range within an octave and a half').

Besides the solo, antiquity was only acquainted with choral singing, which, however, only differed from the former in that the expression of the melody was strengthened by an increased number of voices; it was in unison, part-singing being unknown (as is still the case amongst the Greeks and most Orientals) and a creation of the middle ages. In the ancient chorus there was only a difference in octaves, when men and boys or men and women sang together. The director of the chorus (*coryphaeus*) stood in the centre, and at the same time acted as precentor; it was of course his duty to keep the singers in time and unison. But while there was undoubtedly a lack of what we call harmony, the instrumental accompaniment must have been heterophonous even in classical times, and consequently could deviate from the melody of the song. But this accompaniment (which was in a higher key than the singing) must not be considered part-song. It was an apposition of single tones, which certainly gave the melody a kind of harmonic foundation, but claimed no kind of independent importance as a second voice in the contrapuntal sense.

The centre of gravity in instrumental music was not situated in the concert of several instruments, but in the solo, that is to say, in the effect of a single instrument, the skill of the individual artist—a sufficient proof that this kind of music was only poorly developed. In the same manner, the simplicity or rather scantiness of the means at the disposal of instrumentation, makes it perfectly intelligible why it was, and was bound to remain, entirely subordinate to singing. It was practically limited to two instruments, the cithara and the flute; all other instruments, such as the horn and the trumpet (for military music), cymbals, kettledrums and other noisy instruments (chiefly used at the festivals of Bacchus) being

¹ See O. Crusius, 'Die delphischen Hymnen,' in *Philologus*, liii. (1894, supplementary volume).

outside the pale of art proper. The hydraulic organ, a later invention *de luxe*, seems to have been given a place amongst the acknowledged instruments of art during the empire ; it was accordingly allowed to compete (though certainly only in Rome) for prizes in musical competitions. Quintilian bears witness that its power of expression was considerable, since he allows its notes the power of alternately exciting and calming the audience.

Among flutes, the simple flute was the special instrument of artists and *virtuosi*, especially Alexandrian. It was, as is well known, not a cross flute, but a long one, and seems to have most nearly resembled the hautboy. Its tune was not soft and mild, adapted to express melancholy and tenderness, but rather wild and passionate ; but, although it is so described, it must not be forgotten that a contrast is implied with the colourless sound of ancient stringed instruments. These latter, the lyre and the cithara (closely akin and frequently identified forms of the same class) were instruments resembling a harp, without a fret-board, with strings of gut or sinew (metal strings being unknown to the ancients), whose number was gradually increased to eighteen. A number of oriental harps also made their way into Greece, which all appear to have more or less resembled the psaltery of the Assyrians and Hebrews. None of them ever attained the importance of the lyre, which, in all sizes, played the part in Greek music of the violin family in modern times. It was played either with the hands or with a little wand (*plectrum*), the latter being apparently only used in accompanying singing, not in simple instrumental performances, since runs and quick passages could be better executed with the fingers. The use of the bow (an invention of the Arabs) was completely unknown in antiquity.

The lyre and cithara, whose power of tone and expression appears to us extremely limited, indisputably took first rank in Greek instrumental music, 'since at the same time they permitted singing'. For the same reason the cithara was in higher repute than the flute, since it was harder to play. The *virtuosi* devoted their chief attention to it ; in spite of its limited artistic powers, it was difficult to acquire skill in the use of it, and perfect execution consequently created the greater admiration. Distinguished cithara players (*citharoedi*)

were famed for running over the strings with eloquent finger and making them resound as it were with human voice.

Cithara and flute were also played in concert, or independently, or as the accompaniment of song. But amongst the Romans the flute, played alone, rather accompanied dramatic, the cithara non-dramatic song, especially lyric choruses; 'it is the proper instrument in the accompaniment of the Delphic hymns'. It was generally recognized that the same kind of song was not suited for cithara and flute alike. Older Greek music also practised the combination of instruments of the same class on special occasions; thus, there was wedding music for two single flutes, a large and a small, which by playing together were intended to express the harmony of marriage and the precedence of the husband.

We need hardly point out the great difference between the concerto of flute and *cithara* and our orchestra, between ancient instrumental music and modern symphony. In the first place, we are at once struck by a peculiarity of ancient art, resulting from its strictly idealistic tendency, whereby it is especially distinguished from the modern—the uncommon moderation in the use of the means with which it endeavours to produce its effects. But ancient and modern instrumental music are also radically different in their aims. The former certainly endeavoured (and to a certain extent succeeded) to express and call forth certain moods and emotions; its means were also adequate to produce a considerable variety of expression, especially in later times. Aristides Quintilianus divides instruments into male and female. Among wind instruments, the trumpet (*tuba*) belongs to the former, the Phrygian flute to the latter; between both stands the (lower) Pythian (more male) and the (higher) chorus flute (more female). Of stringed instruments the lyre is male, the *sambuca* (with short strings and high treble tones) female; the *polyphthongon* approximates to the latter, the cithara to the former. Between these representative types of the chief kinds of instruments, there were yet others. In general the effect of stringed instruments was considered to be an elevation of the mind into a sphere of peaceful rest and untroubled calm, that of wind instruments emotional exaltation. Canus, a flute-player who was considered unrivalled in the second half of the first century, is reputed to have said that if his audience knew how

much more enjoyment his playing afforded him than them, they would not pay him but would make him pay them ; in Philostratus he boasts of his instrument (the Pythian flute) that it was capable of alleviating sorrow, of increasing joy, of fanning the flame of love, of elevating the devout.

If ancient music set itself the same tasks as the modern symphony, its extremely scanty means prevented it from ever approximately performing them in the same manner. Modern music transports the hearer from the highest to the lowest extremes of mental emotion, affects and touches by the expression of the ineffable, calls up spirits of gloom and bright forms, which struggle for the mastery of the human soul. J. M. Gesner declared that John Sebastian Bach, his colleague at the St. Thomas school, was able to produce effects with the organ, of which all the cithara-players in the world, assisted by six hundred flutes, would never be capable ; although ' a devoted admirer of antiquity ' he thought that his friend Bach or any one like him combined in himself many Orpheuses and twenty Arions. The contrast between a symphony of Beethoven, with the elementary, captivating and melting force of its waves of sound and the simple notes of cithara and flute, is as great as that between one of the great paintings of Raphael or Michael Angelo, with their profusion of forms, their great masses of light and shade, their power of conception and enchanting expression, and the simple and unpretentious, though frequently noble and gracious, figures on Greek vases.

Certainly, however, Greek instrumental music undertook to represent action even without an accompaniment of song, as in the so-called ' Pythian melody ', the subject of which was the combat of Apollo with the Python ; it consisted of five parts or phrases, arranged for the flute alone without song. In the first part the god chooses the scene of the combat ; in the second, he challenges the serpent ; the subject of the third was the combat itself, in which the flute imitated the blasts of the military trumpet and the monster gnashing its teeth when smitten by the arrows of Apollo. The fourth part described the victory, in the fifth the god executed a dance of triumph. The story that the famous *citharoedus* Timotheus, who performed at the wedding feast of Alexander at Ecbatana, had attempted to imitate a storm at sea in his *Sailor* shows that the attempt at imitative music was not confined to the flute ;

certainly the flute-player mocked him, declaring that he had heard more violent storms in his saucepans when they boiled.

If we may speak generally of a further development of Greek music amongst the Romans, it can by no means have been a development in the artistic sense. It consisted, as in the case of all the other arts which were transplanted from Greek to Roman soil, in a strengthening or rather wider but less refined application of the means and the introduction of a mixture of heterogeneous elements, in order to attain stronger but coarser effects, corresponding to the coarser taste of the Romans. As early as the time of Augustus the flute, with a lengthened pipe, an increased number of holes, and plated with brass, had become an instrument which could compete with the trumpet ; it certainly differed from the old Italian flute as much as a modern grand piano from the little spinets of our great-grand-fathers. This strengthening of the sonorousness of the flute soon brought about similar changes in the construction of other instruments, although Ammianus Marcellinus is the first writer who speaks of *citharae*, 'as large as carriages'.

Further, the combination *en masse* of instruments of the same kind and the gathering together of a large number of different instruments produced great effects. The former at least was known in the time of the Diadochi, especially at the court of Alexandria, where Ptolemy Philadelphus introduced into an enormous and magnificent procession a chorus of 600 men, amongst whom 300 *citharoedi*, carrying gilded *citharae* and crowns of gold, played in unison. The concert of instruments of different kinds also was probably not uncommon in Alexandria, since it had been peculiar to Egyptian music from the earliest times. On the monuments of the ancient kingdom of the Pharaohs may be seen stringed, wind and pulsatile instruments, sometimes instruments of the same kind (two harps, eight flutes) being played together. The monuments of the new kingdom exhibit Egyptian music under a far more brilliant and magnificent aspect. 'The orchestras of this period are more numerous, the sounds of the harp are mingled with those of the lyre, flute, double fife, guitar and hand-tymbal', although only females appear as players and singers. The pomp-loving court of Alexandria was not likely to neglect to enhance the splendour of its marvellous festivals and

pageants by employing the native music, which was so admirably suited for the purpose.

Foreign music other than Greek also at an early date made its way into Rome. From the time of the campaigns in Asia Minor women, in whose hands Eastern music had always been, played the Chaldaeo-Babylonian *sambuca* at banquets and carousals; later, female musicians from Syria (*ambubaiae*, from Syrian *abbubo*, 'fife') were to be heard on public places with native instruments (fifes, stringed instruments, kettle-drums) in increasing numbers. The Babylonian bagpipe is first mentioned at Rome in imperial times; Nero wanted to try it, although it is quite possible that it may have been long known. In any case, from the beginning of the empire, it is the influence of the neo-Egyptian or Alexandrian music which seems to have chiefly contributed to the reorganization of Roman music, especially instrumental. Even under the emperors Alexandria continued to be the seat of a manifold and prolific musical activity. Its population yielded to no other in the world in its love and knowledge of music; even those who could neither read nor write were able to detect at once a false note on the cithara; male and female singers or players on the cithara roused the masses to frenzy; music appeared to be a panacea for all evils. Alexandrian musicians and singers after the time of Augustus were held in high esteem at Rome, where they met with the greatest success. An Alexandrian *virtuoso* on the *trigonon* (perhaps the large 6 ft. high Egyptian harp), who performed publicly at Rome about the end of the second or the beginning of the third century, aroused such general enthusiasm, that many soon knew by heart the melodies he had played. Thirty years after the conquest of Egypt, the ladies of Rome were as familiar with the Alexandrian melodies as with theatrical airs, and at the end of the first century Roman dandies were in the habit of humming these airs as well as those of the Gaditanian ballets.

In the last days of the republic, certainly, 'symphonies' and the choruses who executed them (*symphoniaci*) are often mentioned, especially at the luxurious banquets and orgies of the wealthy. But these choruses at that time may have consisted entirely of players on the cithara and flute. It was perhaps the invention of the pantomime (*pantomimus*) in 22 B.C. which led to the introduction of orchestral music properly so

called into the Roman theatre. The texts represented by the dancers were sung by choruses which, in the very large uncovered theatres, required a very powerful accompaniment, in entire harmony with the character of a spectacle, the chief object of which was to affect the senses. Pylades, the founder of this kind of music, and also perhaps of the new Roman theatrical orchestra, when asked in what his innovation consisted, is said to have replied in the words of Homer: 'In the sound of flutes and pipes, and the turmoil of men'. In the new orchestra the flute must have been the leading instrument, although panpipes, cymbals, *citharae* and lyres, as in the Egyptian orchestras, combined to produce the noisy effects of the *tutti*. In accompanying the pantomimes and other dancers, time was marked by an instrument called *scabellum*, which could be attached underneath the feet of the players; it consisted of two boards fastened together, which clattered noisily with each movement of the foot. An orchestra which was not completely swamped by this manner of beating time must have been a powerful one, and this music in general can hardly have been anything else but a noisy representation of the rhythm. For the rest, insensibility to the noise of beating time has persisted in modern Italy to a degree that appears astonishing to a northerner.

To all appearance, then, the alteration which Greek music of necessity underwent at Rome, to render it capable of answering the claims upon it, was in part at least in accordance with oriental ideas. Anyhow, the concerto of different instruments, purely instrumental or in singing accompaniments, continued to be as common in Roman music as it was rare or even unheard of in Greek, the combination of the *cithara* and flute excepted. In the time of Horace, songs accompanied by the lyre, the pipe, and the Berecyntian flute were heard in the temples of Venus; and according to Athenaeus, on the occasion of the Parilia, which since the time of Hadrian had been celebrated as a festival of the goddess Roma (April 21), songs were sung throughout the city to the sound of flutes, cymbals, and drums. Maximus of Tyre compares the poetry of Homer, in the variety of its manifold qualities and effects, to a panharmonic instrument, or rather to an orchestra, in which flute, lyre, trumpet, panpipe and several other instruments unite to form the accompaniment of a chorus song.

In imperial Rome also performances of vocal music took place with the aid of colossal appliances. Seneca says that the number of singers in the theatre exceeded that of the spectators in earlier times ; that singers and musicians not only filled the stage but all the places not occupied by the spectators ; that the accompaniment consisted of a number of metal wind instruments in the body of the house, and of flutes and organs of all kinds on the stage. If we remember that the Roman theatres held many thousands of spectators, we can easily believe that these performances far exceeded in dimensions even the English *monstre* concerts. The taste for massive musical effects seems at least not to have diminished in later times. At a celebration of the Roman games ordered by the emperor Carinus pieces were executed by a hundred trumpeters, others by hundreds of performers on different kinds of flutes ; and Ammianus Marcellinus, who describes the Roman aristocracy of his time as extremely fond of music, but absolutely devoid of all other intellectual interests, says that hydraulic organs and flutes of every kind, as well as the *citharæ* 'as large as carriages' already mentioned, were made for the palaces of the great.

The strengthening of the means employed led to, or at least explains, the gradual loss of moral dignity by Roman music, which was used to flatter the senses by gross effects and to tickle the ears of the vulgar. The old Roman theatrical music in the time of Naevius and Livius Andronicus is characterized by Cicero as 'of amiable severity.' In wealth and variety of musical effect it was related to the music of the imperial period as a pre-Mozartian opera to one by Meyerbeer or Wagner. The old constraint and poverty were replaced by greater freedom of rhythm and method, change and variety of modulations, wealth and movement of melodies. Yet this emancipation from the old-fashioned simplicity of the art soon led to its decay, to which the domination of pantomime, with its effeminate and undignified music, wanton and full of noise and trills, mainly contributed. In the first centuries of the Empire, more earnest friends of art repeated, no doubt with even greater reason, the regrets already heard during the time of Alexander the Great. It was said that the ancients alone had known how to preserve the dignity of art ; that modern composers would have nothing to do with their serious tenden-

cies, and had substituted an enervated and chattering music for one that was virile and divine. 'There', says Plutarch, 'reigns the art of dancing, to which music is almost entirely subordinated'; and Quintilian expresses the opinion that the indecent and effeminate music of the stage had largely contributed to the annihilation of the still surviving remnants of virility. A Greek writer (pseudo-Plutarch *De Esu Carnium*, ii. 2) declares that a distempered ear should be regarded as a disease which had corrupted music, 'the soft and effeminate notes of which provoke immodest touches and lascivious tickling'.¹

In short, the lamentations of that period over the decay of music greatly resembled those uttered in modern times by the champions of a more serious tendency in music. More than seventy years ago, Thibaut, in his treatise *On Purity in Musical Art* (English translation by W. H. Gladstone, 1877) declared that 'in music there may be concealed all manner of impure, morbid and immoral elements; and thus the rubbish that, if presented by the pen or pencil, could not, for credit's sake, fail to be rejected, comes to be swallowed wholesale by the unwary'. 'Many of our innocent girls, if they knew what they are often obliged to hear, or even to play or sing themselves, would die of shame and disgust'. The author inveighs against the 'enervating, uncouth, preposterous, or meretricious', in music; against the 'spasmodic, distorted, exaggerated, rampant and deafening noise, which stirs up everything ignoble in man'; he asks whether music, half compounded of unnatural and unhealthy elements, is not more injurious than beneficial to us; adding that of all the arts it is least able to escape the reproach of having contributed to the vitiated taste of the age. According to him, it is necessary, by returning to naturalness and simplicity to restore to the unstrung nerves of music the elasticity that they need, and to revive what is at the point of death—'the pure love for music as music, and the ennobled taste, which asks to be purified and elevated by music, not to be led into and irrevocably engulfed in the mire of the vulgar and unnatural'. It is besides easy to understand that the ancient seat of this effeminate music, whose prevalence at that time was so deplored, was Alexan-

¹ W. Baxter's translation in Plutarch's *Morals* trans. by various hands (London, 1870).

dria, and that the relation between the music of that city and ancient Greek music was analogous to that between modern Italian (and to some extent French) music and the German music of the eighteenth century.

But if the Romans degraded the art of music by allowing it to become an instrument for the satisfaction of sensual enjoyment, we must at least allow them the credit of having known exactly how to make the most of it for this purpose. Music, like all the other arts, was employed by them, to a far greater extent than is usual or possible at the present day, to enhance the pleasures of life and beautify existence. Only the existence of an institution such as slavery; only the fact that the arts, which we are accustomed to regard as a costly product of rarely united factors, as the flower of our intellectual life, were then learnt and practised on a large scale by slaves at the bidding of their masters and under the superintendence of overseers, could render possible the employment of art on such a gigantic scale in the service of luxury. In the armies of slaves, some of them at least natives of highly civilized countries, who belonged to the great men of Rome, there must have been many intelligent and gifted men; and, under the conditions of ancient art, there were far more opportunities for learning and instruction than in modern times. Thus it was easy to form 'chapels' of singers and musicians of every kind from the hundreds or thousands of slaves of a great house (as from the Russian serfs), which could be completed by the purchase of fresh artists, who besides were continually passing from one owner to another by sale, gift or inheritance (thus, in Russia, Potemkin bought from Count Rasumovski a band of fifty performers for 40,000 roubles). Chrysogonus, Sulla's wealthy freedman, had so many musicians among his slaves, that the neighbourhood of his house resounded day and night with the noise of their songs and flutes. When their masters took short excursions, they were accompanied by bands of singers and musicians; the villas and watering-places visited by the *élite* of society re-echoed from morning till evening with the sound of music and song. Maecenas was lulled to sleep by the gentle strains of symphonies from a distance; Caligula, reclining on the deck of a magnificent galley, by the murmuring waves of the gulf of Naples and the noise of song and music.

At table, especially, where all the senses had to be gratified

at once, there was no lack of music ; a practice which persisted to the last days of antiquity, frequently to the torture of the guests. ' You ask ', says Martial, ' what is the best kind of banquet. That at which there is no flute-player '. At luxurious feasts large choruses accompanied the fair Andalusians in their castagnette dances ; at the gay repasts of a society of learned men Greek male and female singers sang songs of Sappho and Anacreon to the music of the cithara ; the Younger Pliny leaves the single guest, whom he has invited to a simple meal, the choice between a reading, a scene from a comedy, and a performance on the lute ; and Martial, who had a lodging on the third floor, promises a friend at least a performance on the short flute, to season an extremely frugal meal. The extent to which musical entertainments monopolized the banquets of uneducated upstarts is shown by the description, which can hardly be a caricature, of Trimalchio's banquet in Petronius, which certainly belongs to a period in which a real or affected fondness for music was extremely prevalent. In this the food is brought on and handed round, the tables brushed and wiped, in fact, all the details of service carried out to a continual accompaniment of music and singing : ' You would have thought you were in a theatre, not a private house '.

From time immemorial music had been an item in all spectacles and religious ceremonies. In imperial times there appear to have been special singers of hymns (*hymnologoi*) attached to the temples of Greek and Oriental divinities (e.g. the Great Mother and Attis); in the cult of Isis music played a specially important part. Nevertheless, a distinction between sacred and profane music was unknown in antiquity (' even though there was a special sacral style for certain solemn climaxes in divine service ') ; indeed it could not be otherwise, since spectacles formed part of the religious service, which throughout was of a cheerful and festive character. Perhaps Mendelssohn in the chorus of St. Paul (*Seid uns gnädig, hohe Götter*) succeeded in reproducing the impression of old religious music as nearly as is possible under modern artistic conditions. The Catholic service also, until the reform of Church music was undertaken by Palestrina by direction of the Council of Trent, was accompanied by singing like vaudeville melodies ; hence also the lauds before the images of

the Madonna were occasionally sung in the style of carnival songs or *strambatti*, short popular songs most nearly resembling our street ballads. Even in modern Italy there is hardly any essential difference between secular and religious music at the daily service even in Rome, none at all in Naples.

Owing to the unrestricted publicity of the ancient spectacles theatrical melodies must have spread far more widely and rapidly than is possible at the present day ; people were heard singing the airs heard on the stage in the streets and public places. As early as Cicero's time there were many connoisseurs, who at the first note of a flute ritornello, could say whether the piece was from the Andromache or Antiope, which astounded Cicero himself ; and even in those days the general public keenly criticized the singers and allowed no mistake to pass without an expression of disapproval. But the spread of an interest in music at that date is most clearly shown by the performances of the nature of concerts unsupported by dramatic action ; on the other hand, in 167 B.C., the Roman public was so entirely uncultivated, that the chief Greek flute-players and their choruses could only arouse interest by giving a kind of rough and tumble performance.

A century later it was no uncommon thing for musical *virtuosi* (*citharoedi*), who accompanied their songs on the *cithara*, to obtain a favourable reception at Rome. They came forward in the magnificent Pythian festal attire ; a long, gold-embroidered robe, a purple cloak with ornaments of divers colours, a golden crown on the head flashing with precious stones, the artistically fashioned *cithara*, covered with gold and ivory, in their hand.

In imperial times, in addition to the *citharoedi*, other artists gave performances without singing on different instruments, especially the *cithara* and its varieties, the flute and the organ ; there were also dramatic singers (*tragoedi*), whose airs and lyric scenes, often performed by them in mask and costume, closely resembled dramatic representation, and lyric singers properly so called, who specially chanted hymns in honour of the gods. Similarly, at the Isthmian games Nero is said to have sung a hymn to Poseidon and Amphitrite and a short song on Melicertes and Leucothea. It is not known whether the female singers and *virtuose*, who delighted the public of Alexandria, also performed in public at Rome. A

mural painting at Herculaneum represents a concert scene ; in the centre is seated a flute-player, in a long embroidered robe, playing on the double flute and beating time with the *scabellum* ; on the right stands a female player on the *cithara*, grasping the strings with her left hand and holding the *plectrum* in her right ; on the left is seated a female singer, a copy of the words in her hand, waiting for the cue to join in. Certainly, the painting seems to represent a public concert, but it affords no certain indications as to time or place. Choruses, with or without soloists, frequently sang to different instruments. It is quite possible, although there is no positive proof of it, that pieces of the nature of symphonies were performed without singing at public concerts, as a kind of introduction to instrumental solos.

Nero, who desired to shine not merely as a poet, but also as a singer and *citharoedus*, first introduced Greek *agones* (artistic competitions) into Rome, where they were afterwards regularly held. At the periodical 'sacred' festival, instituted by him in the year 60, musical competitions formed the chief attraction. Although they did not give such offence as athletic contests, they were disapproved in conservative circles. 'Justice', says Tacitus (*Annals*, xiv. 20), 'had nothing to gain from them ; the knights would not fulfil their duties as jurymen any more efficiently, after hearing, as experts, effeminate songs and languishing airs'.

The Capitoline competition, instituted by Domitian in 86, was held in far greater and more lasting repute than the Neronian. For the musical performances Domitian ordered a covered theatre to be built in the Campus Martius by the famous architect Apollodorus ; it was called the Odeum, was capable of holding 10,000 or 11,000 spectators, and as late as the fourth century was considered one of the most beautiful buildings in Rome. At this festival, which was celebrated every fourth summer, poets, singers and musicians competed for the wreath of oak-leaves, which the emperor himself presented to the victors after the judges had pronounced their decision. This distinction, the comparatively rare occurrence and solemnity of the festival and the brilliancy of the audience, lent an unparalleled importance to these contests of singers and *virtuosi* in the musical world of the period. In fact, the winner of the prize was considered the first in his art not

merely in Rome, but in the world. Artists came from the most distant countries, from Asia and Egypt, to take part in the competition, and several monuments are still extant, with inscriptions stating that this or that 'celebrated' musician had gained the crown at the Capitoline *agon*. Special mention is made of competitions in singing, playing on the *cithara*, the solo on the Pythian flute and dramatic recitations; competitions in simple *cithara*-playing without singing and on the choral *cithara*, introduced by Domitian, were soon discontinued.

The executants naturally preferred the compositions of the best known masters. Thus Menecles, the ambassador of the Teians to the cities of Crete, frequently played on the *cithara* compositions by Timotheus and his near contemporary Polyidus, 'admirably and in the style of one who understood the technique'. For the rest, such executants were not only far more commonly (if not as a general rule) composers than at the present time, seeing that the handling of the far simpler and consequently more permanent musical forms could have offered little difficulty to skilled musicians, but they were also frequently poets, the result of the closer connexion between poetry and music at that time. The most famous *virtuosi*, such as the singer Tigellius of the court of Augustus, the *citharoedi* Menecrates and Mesomedes of the courts of Nero and Hadrian, were famous for the performance of pieces composed or set to music by themselves. Some fragments of the poems of Mesomedes are preserved, and the music to the hymns to Nemesis and Helios.

In other respects, the style affected by the musical *virtuosi* of the imperial period was much the same as that of the present day. The greatest value was of course attached to training by an experienced singing-master (*φωνασκός*); hence in inscriptions on singers the name of their instructor is sometimes expressly mentioned. A certain Marcus Aurelius Musaeus was 'the first and only singing master' to whom statues had been erected at Elis and Delphi for his success as a teacher. Among the long and wearisome preparatory exercises by which perfection was attained, the solfeggio from the lowest to the highest notes was especially prominent. In addition, vocalists were obliged to lead a strictly regulated life, which was considered necessary for the strengthening and development of the voice. They spared their throat as much as possible, rested

it for a time after every effort, and held a handkerchief before their mouths, when they had to speak loudly. They were extremely temperate, in their eating and drinking, used purgatives and embrocations, lay on their back with sheets of lead on their breast, walked at certain times, avoided the sun and wind, fog and dry air, and so forth. In fact, for singing in large and partly open spaces far stronger and more lasting vocal powers were required than at the present day. And yet *citharoedi* and *tragoedi*, when they appeared in public, sometimes strained themselves so violently that they broke a blood-vessel.

From the time when their artistic development was complete, the *virtuosi* were nearly always travelling; they could not possibly obtain a permanent engagement in one place, since there were no regular theatres and performances only took place on the occasion of particular festivals. The more famous Greek *virtuosi* regularly toured through Asia Minor, Greece and Italy, and were frequently honoured with statues, civic rights and other distinctions, in the towns where they had been enthusiastically received. The fees and income of artists of repute, including prizes at festal performances, were very high. Vespasian, in other respects so parsimonious, ordered several musicians of experience to appear at the games given by him at the dedication of the theatre of Marcellus, which he had restored; a *tragoedus* received 400,000 sesterces, the *citharoedi* Terpnus and Diodorus 200,000, some 100,000, none less than 40,000, not counting the distribution of a large number of gold crowns. Music teaching in great houses at Rome was also very lucrative, and the fees of famous singers and *citharoedi* were the envy and disgust of literary and scientific men. Martial, tired of his wearisome and fruitless duties as a client, removed for a time from the capital to Forum Cornelii (Imola) whence he wrote to his friends that he would never return to Rome except as a qualified *citharoedus*. Again, in a spirit of bitterness, he advises a father not to give his son a learned education, nor to allow him to touch the works of Cicero or Virgil; he even advises him to disinherit him, if he writes verses; if his son wants to learn a profession by which he can earn a living, let him become a *citharoedus* or *choraules*.

Of course, these *virtuosi* had crowds of enthusiastic admirers

of both sexes. The passion of women for singers and musical *virtuosi* furnished ample material for scandal, satire and lampoon. Wealthy ladies of distinction cherished the little wands with which famous *cithara*-players had smitten the strings, pressed kisses on these precious mementoes, offered sacrifice for the success of their favourites in an approaching competition, and sometimes, it was asserted, even paid a high price for their favours. In the highest circles and even at several courts *virtuosi* were honoured and highly paid guests. Mark Antony the triumvir bestowed the collectorship of the taxes of four cities and a military escort upon the famous *citharoedus* Anaxenor, who had been honoured by his birthplace Magnesia on the Maeander with a priesthood and public memorials. Tigellius of Sardinia, the singer and flute-player, who was on the most intimate terms with Caesar, was equally welcome at the courts of Cleopatra and Augustus. The dramatic singer (*tragoedus*) Apelles of Ascalon, a powerful favourite of Caligula, fell into disgrace because he hesitated to answer the Emperor's question, 'which of the two seemed to him greater, Jupiter or Caligula?' The emperor ordered him to be flogged, and congratulated him on his voice, which he declared sounded very pleasant even when he was howling with pain. Nero presented the *citharoedus* Menecrates with a palace and a large estate. Mesomedes of Crete, the poet and composer already mentioned, freedman and favourite of Hadrian, on whose favourite Antinous he composed a panegyric, received a salary which Hadrian's successors thought it right to reduce.

This lively and flattering sympathy and favour, shown in various ways, was bound to foster caprice, vanity and arrogance. The fabulist Phaedrus relates with great satisfaction, how one of these puffed up *virtuosi* had recently made himself universally ridiculous by his absurd vanity. The flute-player Princeps ('prince'), who usually accompanied the famous pantomime-dancer Bathyllus (freedman of Maecenas and inventor of the comic pantomime), broke his leg while the scene was being changed (owing to his own carelessness or the fall of some scenery). He was confined to bed for several months and the artistic public greatly missed his performance. When he was able to walk again, a distinguished personage, who was arranging a spectacle (apparently an allegorical piece at a popular festival) asked him to appear in it. The curtain

fell,¹ the thunder rolled, the gods spoke in the usual manner ; after which the chorus struck up a song, the words of which were unknown to Princes, beginning with ' Rejoice aloud, O Rome ; thy Prince is safe and sound ' ! The public rose and applauded ; Princes, thinking the applause was meant for him, threw kisses to the spectators ; the knights (whose seats were in the front of the house) observed his folly and conceit and laughing loudly demanded an encore. The song was repeated, Princes bowed to the ground on the stage, the knights again applauded in mockery. The general public at first believed that he was asking for the crown. But when his real meaning became known, the impudent fellow, who had dared to claim the homage paid to the divine (imperial) house, was thrown out amidst general indignation, ' with his beautiful white leg-bandages, white tunics, and white shoes'.

According to Horace, capriciousness was a never-failing peculiarity of all *virtuosi*. The fault of singers, he says, was that, when amongst their friends, they could never be induced to sing; but, when not asked, there was no stopping them. Tigellius of Sardinia, who had deeply offended Cicero in 45 by his pretentious irritability is represented by him as a type of instability and capriciousness. Even the imperious Augustus often asked him in vain to sing and seems to have put up with the rudeness of an artist who had already been spoilt by Caesar. If, however, Tigellius thought fit to oblige, he would sing ' Io Bacche ! ' from the first course to the dessert in every key. He was a mass of inconsistency. At one moment he would run as if a pursuer were at his heels, at another he would walk slowly as if in a procession. Sometimes he had two hundred slaves, sometimes ten. Now he would talk big, now he asked for nothing more than a three-legged table, a salt-cellar, and a coarse *toga* to keep out the cold. If he received a present of a million, in a week his purse would be empty. He scattered his easily-gotten wealth broadcast, and his lavish generosity attracted a retinue of quacks, beggars, jesters, and female dancers and singers. Hesat up all night and slept all day.

The mutual envy and jealousy of the artists were especially aroused by the musical competitions. Rivals watched and strove to conciliate one another, while secretly abusing, and

¹ It was *lowered* at the beginning of the performance, and *raised* at the end, contrary to the custom of the modern stage.

sometimes even publicly insulting each other. Dangerous competitors were got out of the way by bribery or otherwise rendered harmless. In the presence of the judges and the public a great show of respect was made. Nero, who scrupulously observed the regulations for the public appearance of the *citharoedi*, never sat down when tired, never spat, never wiped the perspiration from his forehead except with his hand or dress, always prefaced his performance by an appeal to the people: 'Gentlemen, give me a favourable hearing!' At the end, the performer again sought a favourable verdict, doing obeisance on bended knee and saluting the public with his hand, and awaited with real or pretended nervousness the decision of his hearers.

Even the most famous *virtuosi* rarely appeared without having paid for applause in advance. Leaving the competition out of consideration, this was perhaps excusable in the case of artists who had to appear before thousands of hearers of the lowest class, who were by no means chary of their expressions of disapproval; *citharoedi* were frequently hissed off in the theatre of Pompey, which explained their nervousness on entering. Evidently, there was a considerable number of people at Rome, who had nothing else to do but 'applaud a Canus or a Glaphyrus', and the *claque* was considered a lucrative profession.

This lively and general susceptibility of the Romans to music necessarily led to dilettantism in execution. Certainly, Roman prejudice, which considered not merely professional ability in music and singing, but even their practice for amusement, as utterly improper for the freeborn (especially men of rank), had long resisted the fashion. But as a result of the increasing influence of Greek manners and customs, the old-fashioned severity had long since made way for an increasingly liberal tolerance even in this respect. As early as the time of the Gracchi, there were singing and dancing schools at Rome, which were attended by boys and girls of good, even noble, family, no doubt to the great disgust of men like the Younger Scipio. But practice and skill in singing at least were soon looked on more indulgently. In the *De Oratore* of Cicero (91 B.C.) one of the chief personages of Rome at the time (the orator Lucius Licinius Crassus, consul 95, censor 92) mentions without any sign of disapproval that his friend, the knight

Numerius Furius, a family man, occasionally practised as an amateur the art of singing which he had learnt as a boy. Certainly, when a man of Sulla's position not merely admitted actors to his society but did not disdain to be thought a good singer himself, this was bound to give great offence. Cornelius Nepos, in speaking of the differences between Greek and Roman manners and ideas, states emphatically that the Romans considered music unseemly for a man of prominent position. The foppish and dissipated youths, who belonged to Catiline's party, are described by Cicero as skilled in affairs of the heart, singing, dancing and playing on stringed instruments. Diletantism in music was, no doubt, at that time disapproved by many in any circumstances, but the theoretical study of the art must have been by no means uncommon, since Varro included it amongst the sciences which formed the basis of a general education. From the beginning of the empire the theory of music was no doubt not only generally reckoned one of the higher subjects, but it was quite a common thing for boys to be taught to sing and play on stringed instruments as a finish to their education. The section on music (treating of rhythm and metre) in the encyclopaedic work of Augustine on the seven liberal arts, based on that of Varro, is still extant. Columella mentions musical as well as rhetorical and mathematical schools. Titus, who was brought up at the court of Claudius with his son Britannicus, and 'instructed in the same sciences by the same teachers', made rapid progress in all branches of learning. He was not only well acquainted with the rhetoric and poetry of the two languages (Greek and Latin), but 'he was also a good musician, and played skilfully and agreeably on the *cithara*'. Britannicus (born February 13, 41), whose superior voice excited Nero's jealousy, had also received a musical education. At the Saturnalia in December, 54, Nero, chosen 'King' by lot amongst his companions, ordered the young prince, who was not yet fourteen years of age, to come forward and sing a song, hoping that he would make himself ridiculous. But Britannicus sang a poem with the utmost self-possession, containing obvious allusions to his having been unlawfully deprived of the throne. The general emotion aroused by the song aggravated Nero's hatred, and was the direct and final cause of the horrible assassination of this promising lad in the following year. Suetonius expressly states

that Nero when a boy had received instruction in music as well as other branches of learning, and Seneca (in the year 54) praises him as the equal of Apollo in voice and execution. One of the instructors of Marcus Aurelius was Andron, who taught him music and mathematics. The biographer of Commodus declares that he had profited nothing by the teaching of the best scientific masters, but that from his earliest years he had shown talent in things ill-suited to the imperial dignity, such as the art of modelling cups, dancing and singing.

Of course more importance was at all times attached to the musical education of girls than of boys. Famous musicians like Demetrius and Tigellius in Horace's time spent a great part of the day by their pupils' easy chairs. These girls not only learnt to sing, but to play on the *cithara* and other stringed instruments; frequently they became sufficiently proficient to set poems to their own music. Choruses of boys and girls, and even of women, of good family often sang at religious festivals. Catullus wrote a hymn of praise to Diana for one of these double choruses. At the secular games the festal song was sung by twenty-seven boys and girls, whose parents were still alive, in the temple of Apollo on the Palatine and in the Capitol, or during the procession to and from the two sanctuaries. At the funeral obsequies of Augustus children of distinguished family of both sexes sang the lament for the dead; according to Herodian, at the rites preceding the apotheosis of the emperors, a chorus of boys and women of noble birth, standing by the bier in the Forum, sang the praises of the deceased to mournful and solemn melodies.

At the dedication of the temple of Augustus by Caligula in the year 37 boys and girls belonging to the noblest families, whose parents were still alive, sang a panegyric. On certain occasions men of rank were not only permitted, but even ordered, to sing in public. Even so earnest and austere a man as Thræsea Paetus sang a scene from tragedy in costume in his native city of Patavium at a solemn spectacle, a long-standing institution, which was only held at intervals of thirty years.

In olden times the more serious Romans only partially approved of the musical dilettantism of girls and women; this is Sallust's point of view, who says of Sempronia, the

confidante of Catiline, that she sang with greater skill than be-seemed an honourable woman. Later, to all appearance, the voice of censure became silent, and proficiency in music was generally recognized as one of the essentials of female education. An accomplishment which made Statius's stepdaughter a good match was her skill in playing the lyre and singing his poems to her own music ; the Younger Pliny's third wife was equally accomplished. Lucian praises in exaggerated terms the singing and playing of the beautiful Panthea of Smyrna, the favourite of Lucius Verus. He compares her to the Muses and Sirens ; at the sound of her voice the nightingale is mute ; her singing is worthy of her beautiful lips. She accompanies the *cithara* to perfection ; her careful observance of the melody (*ἀρμονία*), and strict adherence to the words, are severely correct ; her voice rises and falls in measured cadence ; the *cithara* is in perfect agreement with the voice, the *plectrum* keeps time with the throat ; even Orpheus and Amphion could not attain the rapid movements of her fingers or her euphonious modulation.

But even the musical dilettantism of men appears to have aroused only trifling opposition in the time of Augustus. As a matter of fact, the only writer who expresses his disapproval in imperial times is the Elder Seneca, a consistent admirer of the old Roman simplicity and austerity of manners. He laments that noble studies are neglected, that men's minds are taken up with pursuits which are even worse than idleness, that the indecent occupations of singing and dancing claim all the attention of an effeminate youth. The censure of the Younger Seneca, writing under Claudius, is only directed against an exaggerated dilettantism. According to him, passionate lovers of music spent the whole day in hearing, singing and composing airs ; tortured their voice by artificial modulations to produce an unnatural expression ; were continually beating time with their fingers to some piece which they had in their head ; even on serious, nay, melancholy occasions, they could not help humming a tune. Similarly, Manilius describes a lover of music, who at a drinking bout enhances the enjoyment of the wine by sweet song, sings on the sly even at work and business, and when he is alone does nothing else.

The extent to which musical dilettantism had spread in Rome since the beginning of the empire is amply confirmed. By means of a beautiful voice a man might hope to please the

ladies ; an accomplished singer might look for an entry into the best circles. Generally speaking, it would seem that musical talent was especially appreciated as a passport to society. Trimalchio in Petronius asks one of his guests, who had the reputation of being a good singer, to give the company something good ; the guest regrets his inability to oblige ; he declares that in his youth he had sung so much that he nearly became consumptive. Trimalchio himself 'murders' some airs of Menecrates, a famous *citharoedus* and composer of Nero's time. The universal dilettante in Martial, who does everything 'nicely', but nothing well, sings 'nicely' and plays the lyre 'nicely'.

This dilettantism seems to have been very common even in the highest circles. Gaius Calpurnius Piso, the leader of the conspiracy against Nero in 65, according to the *Laus Pisonis*,¹ played the lyre so admirably that he might have been a pupil of Apollo ; and indeed, in time of peace why should he have been ashamed of it ? Achilles himself swept the strings with the same hand which hurled the terrible lance against the foe. The number of emperors who are said to have been amateur vocalists or instrumentalists is remarkable. Hadrian was proud of his singing and proficiency in playing the *cithara*. Fronto, when advising Marcus Aurelius to enjoy his holiday at Alsium, appeals to the example of his predecessors, amongst them Hadrian, who found time from the cares of state to occupy his mind with other things, being fond of a good meal, of composing, and of the society of flute players. Caracalla also played the *cithara* and erected a memorial to the famous performer Mesomedes, who had gained a great reputation at the courts of Hadrian and Antoninus Pius. Elagabalus (Heliogabalus) sang to the accompaniment of the flute (i.e., dramatic scenes), blew the trumpet, played the *pandura* (a stringed instrument) and the organ. Alexander Severus, who was also fond of music, played the lyre, the flute and the organ, 'as well as the trumpet, although he gave up this instrument after he became emperor'. It thus appears that the *cithara*, although undoubtedly the favourite instrument of the dilettante, was by no means the only one. Nero made a vow that, if he succeeded in putting down the revolt against him, he would perform on the hydraulic organ, the

¹ A panegyric on Piso now generally attributed to Titus Calpurnius Siculus.

bagpipe and the choral flute, at the games with which he intended to celebrate his victory ; at a time when the gravest danger threatened, his counsellors, after a hurried consultation, had to spend the rest of the day in inspecting some newly invented hydraulic organs and listening to his explanations of their respective difficulties. Lucius Norbanus Flaccus was a zealous trumpet-player and practised assiduously, even on the morning of the day on which he entered upon his consulate (January 1, 19 A.D.) ; the crowd assembled before his palace to compliment him took it as a bad omen that a consul should be heard playing on an instrument inseparably associated with war. Of course, the example of the emperors contributed to the spread of this dilettantism, especially in the highest circles.

The manner in which all these instances are recorded makes it clear that what shocked Nero's contemporaries was neither his passion for music nor his performances as an amateur, but the fact that he was not a simple 'amateur', but posed as a 'professional', performed before the public, and submitted his performances to its judgment. The conviction that he was a born artist dominated his mind throughout his life ; and with the oft-repeated words upon his lips, 'What an artist is lost in me !' he died. It is easy to imagine how he was strengthened in his conviction by the exaggerated expressions of enthusiastic admirers. Even his tutor Seneca, in a poem on his accession, calls him the equal of Apollo 'in the art of singing and vocal powers'. Another poet compares him as a *citharoedus* not merely with Apollo celebrating his victory over the Python, but with the divinity who stretched the heptachord of the zones of the world : 'if there are gods, then surely they speak with a voice like his'. On the outbreak of the revolt against him, nothing is said to have excited Nero so much as a proclamation of Vindex in which he was called a poor *citharoedus*. The falsehood of this reproach, which denied him knowledge of an art in which he was a thorough proficient, was regarded by him as the best proof of the falsehood of the other charges brought against him ; he kept asking his courtiers whether they knew a better player. To the astrologers who early foretold his deposition he gave the answer (well known in Rome) : 'My beloved art will help me to endure it'. Immediately after his accession, he summoned Terpnus, the most famous *citharoedus*

of his time, made him sing and play to him every day after dinner and far into the night, and endeavoured to train his dull and feeble voice by incessant practice and study and the strictest attention to diet. He made his first appearance in the year 59 (the fifth of his reign and the twenty-second of his age) in his garden and palace on the right bank of the Tiber ; in 64 in the 'Greek city' of Naples ; but it was not till 65 that he appeared publicly as a *citharoedus* in the theatre of Pompey at the competition instituted by himself. Towards the end of 66 he set out on his professional tour through Greece, from which he probably returned at the end of 67. Next to playing on the *cithara*, he liked best to appear in semi-dramatic performances of solo-scenes from tragedies in costume and mask. Probably, like most other *citharoedi*, he was also a composer. A regular army of well-trained and organized *claqueurs* always greeted his entrance with applause. As often happened at this period, the cruel and the ridiculous were combined. Spies were everywhere on the watch, and woe betide the man who did not applaud loudly enough, or slipped out of the house before the end of the imperial turn, or went to sleep ; when there was an epidemic of sore throats in the city, it went ill with any one who forgot to offer vows and sacrifice on behalf of the 'heavenly' (i.e., imperial) voice.

Our information as to the state of culture, for the first decades of the third century to about the end of the fourth is extremely meagre. In the last days of antiquity we at least know that the love of music was widespread in both pagan and Christian society. The astronomer, Firmicus Maternus, speaks of 'public musicians held in honour by the people', 'choral musicians', composers and inventors of stage melodies. Ammianus Marcellinus says that the palaces of Rome, once famous for devotion to serious studies, were now filled with the amusements of languid indolence, and resounded with song and stringed instruments. 'In place of the philosopher the singer, in place of the teacher of eloquence the teacher of music is summoned ; musical instruments of all kinds are everywhere to be seen, while the libraries are shut like tombs'. At Constantinople John Chrysostom thus addresses his congregation from the pulpit : 'Which of you could recite a psalm or anything else from the Scriptures, if invited to do so ? But if any one were to ask for devilish airs, for amorous and

indecent songs, he would find many among you thoroughly at home in such things and delighted to oblige him'. Further, the general decay of ancient civilization during those times warrants the supposition that this condemnation of music was not merely justified from the Christian point of view; that the only aim of the art was to provide frivolous sensual enjoyment; and that theatrical music especially, while pantomime absolutely dominated the stage, thought of nothing higher than pleasing the ear.

As music became less and less serious and dignified in character, the more dangerous must have appeared its use in Christian worship, of which church singing was from the beginning an essential element; at least there were good reasons to fear its secularizing influence. Jerome warns those whose duty it is to sing in church not to praise God with the voice but with the heart; not to soften the throat and voice with sweet medicaments after the manner of tragic actors, in order that theatrical airs and melodies might be heard in church. For the same reason, many took offence at the singing of women in church. In the case of the majority, says Isidore of Pelusium, it offers an opportunity for sin; instead of being rendered contrite by the diviner psalms, they only find an incitement to passion in the sweetness of the melody of which they think no more than of songs in the theatre. One who desires to act acceptably to God, must forbid women to sing in church or even to stay in the town, since they abuse the divine gift. Cyril, bishop of Jerusalem (died 386) absolutely forbade women to sing, since the apostle Paul imposed silence upon them in the congregation. The ascetics regarded fondness for music as an unlawful and fleshly desire. Augustine, who was very susceptible to music and often shed tears when he heard the hymns of Ambrose, considered it dangerous for this very reason to abandon himself to such emotions. Fearing that the only reason why the hymns found favour with him was their sound that pleased the ear, he sometimes wished that singing in church could be abolished altogether, and the psalms recited in the manner introduced by Athanasius in Alexandria.

The most ardent supporter of church singing in the West was Ambrose, as Basil had been in the East. Certainly, said he, Christians ought not 'to find delight in deadly songs with theatrical colorature (*chromata*), which incline the heart to

sensual love': but he had all the more esteem for plain-song which he regarded as truly edifying. 'What is more beautiful than a psalm? It is the praise of God and a harmonious confession of faith. The apostle certainly orders that women should be silent in church, but they sing the psalms very well. Every age and sex is suited for psalm-singing. While singing, the old no longer feel the hardships of old age; the younger men sing without incurring the reproach of effeminacy, youths of impressionable age without temptation to sensuality, girls of tender years without injury to their female modesty; women and young maidens, without loss of decency, in dignified earnestness make the praises of God resound melodiously with their sweet, rich-toned voices. How difficult it is to obtain silence in church, when the service is simply read; but the moment the psalm is heard, there is silence at once'.

However, all recollection of the heathen origin and character of music gradually disappeared, in proportion as the old forms received fresh substance; and since they were found to be perfectly adapted to receive this substance, the forms of music created by the old Greek artistic feeling have been preserved in some respects less altered than those of any other art. The system of the six or seven Greek 'modes' handed on in an unbroken tradition remained even in Christian times the foundation of musical composition, 'just as the recitative style of the late-antique sacral music, dependent on the tone in the old Christian *melos*, lived on and still lives (as already shown by Helmholtz) in the liturgical recitations of the Catholic church, although the narrow and fixed rhythmical forms have been broken up'. The masters of the eighteenth century ensured the success of a system based on two 'modes', and in connexion therewith won the first place for a system of harmony (in the modern sense) at once rich and simple.

'Thus', says Westphal, 'we have a most peculiar phenomenon in the history of the arts. On the one hand, the very art, which struck out a path most divergent from the ancient spirit, has come down to us in its historical development directly from antiquity in one continued tradition; on the other hand, the old rules of the plastic art, poetry and architecture, which still possess for us the value of authority, have had to be discovered at a relatively late period'.

I BELLES-LETTRES: POETRY AND ARTISTIC PROSE.

PAGE

I-83

Effects of the system of education. Its chief aim eloquence. Care of the state and communes for instruction in eloquence. The first course consisted of reading and elucidation of the poets. Greek and Roman poets read at school ; in the first century chiefly living poets. Reaction against modern literature. The old poets introduced into the schools. Fronto. Aulus Gellius. Archaic poetry in the second century. Effects of the study of the poets. Teachers often themselves poets. Precocious poets numerous. Improvisation. Rhetorical schools. Pupils' written exercises. Declamations. *Suasoriae*. *Controversiae*. Romantic themes. Tyrants and pirates as subjects. These subjects used in the *Gesta Romanorum*. Magicians in *controversiae*. Greek rhetorical schools. Effects of the rhetorical schools. The rhetorical colouring of poetry, and the poetical colouring of prose. Decrease of school education and decay of language in the second century. Attempts to restore its purity. *Effects of the classical poetry of the Augustan age.* Its importance. Creation and spread of a poetical language. Popularity of Virgil and other classical poets. Poetical dilettantism the result of classical poetry. *Effects of the monarchy.* Parallels from the literature of the early empire. Imperial interest in poetry and literature. Augustus. Maecenas. Tiberius. Nero. Titus. Domitian. Nerva. Hadrian. Disappearance of poetical dilettantism from the court in the second century. Reasons of this phenomenon. Results of the revived importance of poetry and literature. Rise of the book trade. Writing and printing compared. Prices of books. Foundation of public libraries. Introduction

of recitations. Great increase in their number. How the reciters presented themselves. Expressions of approval. The younger Pliny on recitations. Emperors present. Readings in the Middle Ages and modern times. Crowning of poets (especially the Capitoline). Quintus Sulpicius Maximus. Poets crowned in the Middle Ages. Domitian's Alban competition. Precarious livelihood of poets. Juvenal's description. Their dependence on the generosity of the rich and great. Mutual advantages of this state of things. Imperial generosity to poets. Augustus. The later emperors. Generosity of great men. Maecenas. His relations with Horace. Later poets no more than 'clients' of their patrons. The panegyrics on Messalla and Piso. Worse position of poets in Nero's time. Martial's efforts to obtain patrons at court, amongst the aristocracy, amongst the knights. Patrons of Statius. Poverty of both poets. Martial's degraded attitude. Poetry as a means of social amusement. Statius's attitude more dignified. The higher occasional poetry a substitute for journalism. Large output of occasional poetry. Occasional poems of Martial and Statius on the same subjects. Disagreement between Statius and Martial. Their mutual envy and jealousy. Over-production of poetical literature. Preponderance of (mythological) epos. Influence of Virgil. Poetical trifles. Poetry mostly reproduction. Imitation of Virgil and Catullus. Poetical dilettantism of the younger Pliny. Poetical dilettantism common in the higher circles, even at an advanced age. Revolution brought about in Hadrian's time by sophistic. Greek sophistic and its effects in the Greek and Roman world. Interest taken by the emperors and the Romans generally in the sophistic art. Influence of Greek sophistic on the Roman literature of the second century. Apuleius. Importance of poetry in general education after the Renaissance period.

II RELIGION	84-214
-----------------------	--------

I. The Belief in Gods (Polytheism).

Difference between literary and monumental authorities. Literature hitherto almost exclusively utilized. Irreligious tendencies in the latest pre-Christian and earliest Christian times. Hatred of belief a rare occurrence. Lucretius. Epicureans and Sceptics. Religious views of educated Romans outside philosophical circles. Belief (Tacitus). Wavering between polytheism and monotheism (Quintilian). Absolute denial of the gods (Pliny). Reconciliation of faith and reason in Stoic theology. Restoration of belief in the second century. Development and dogmatic authority of the theory of demons. Plutarch. Apuleius. Maximus of Tyre. General impression produced by Greek and Roman literature in the second century. Lucian. The second century emperors. Characteristic phenomena of the newly awakened religious life. Aelian's intolerant orthodoxy. Fanaticism of Aristides. Undiminished strength and permanence of the popular belief. Three proofs of it. (1) *Its power of assimilation*. Adoption of elements from Oriental religions. Theocracy a necessary effect of the intercourse of nations. The idea of superstition relative and variable. Theocracy, only ridiculed by unbelievers, did not give offence to believers. Plutarch's reverence for Greek and Egyptian gods alike. Hellenization of oriental and barbarian gods. Spread of barbarian cults by the soldiers. Nomenclature of barbarian divinities dependent upon the extent to which individual countries were romanized. (2) *Productivity of Polytheism*. New divinities. Annona. Belief in genii. The deification of human beings. The imperial cult. The worship of the dead and living in Greece as heroes. Cult of kings under the Diadochi. Apotheosis of Antinous. (3) *Power of resistance shown by polytheism*. Its influence on Christians. Direct evidence of

the undiminished vitality of the popular belief. The belief in miracles. Appearance of the gods in person. Other divine miracles. The belief in miracles strengthened by the struggle between paganism and Christianity. The same miracle claimed by both. Belief in the announcement of the future in advance the commonest form of the belief in the marvellous amongst the educated. Prognostics in the writings of the historians. Tacitus. Suetonius on Augustus. Continuance of the belief in traditional methods of prophecy. *Haruspicina*. Astrology. Oracles. Their temporary decline owing to the preponderating influence of Italian methods of divination. Their revival and spread of their reputation outside Greek countries. The oracle of Alexander of Abonuteichos. Widespread belief in the significance of dreams. Its connexion with the belief in Providence. The interpretation of dreams a science. The dreambook of Artemidorus. Diseases cured by dreams. The votive tablets of Minerva 'the mindful'. Belief in the efficacy of local divinities outside their proper sphere of influence. Belief in the gods as givers of blessings. Prayer. Votive inscriptions and other religious monuments. Invocation of national and local divinities. General invocation of the gods of definite spheres of influence, especially Jupiter. Lack of definite information as to the number of unbelievers and indifferentists. Atheists a small minority. Cult and its effects on the maintenance of belief. Maintenance of very old forms of cult and ritual in Rome. The ritual of the 'field-brethren'. Old local cults in other parts of Italy. Continuance of very old cults in Greece. Continuance of a general participation in religious worship. Sacrifices. Piety shown practically in the building of temples and other endowments for cult purposes (especially the images of the gods and their adornment with clothes and trinkets). Costly temple presents. Military posts for their protection.

II. Judaism and Christianity.

Contrast between monotheism and polytheism. Judaism and Christianity differently related to polytheism. Dispersion of the Jews in the ancient world. The Jewish emigration not especially commercial. Their settlements in the East and Africa, in Rome, in the rest of Italy, in the West and North. Civil and social position of the Jews. Hatred of the Jews. Attractiveness of Judaism. Religious freedom up to the time of Hadrian. *Christianity*. Missionary zeal of the Christians. Persecutions after the time of Trajan. Comparatively small number of martyrs. Chief causes of the rapid spread of Christianity. Impure elements in the Christian communities. Sects. Montanism. The author of the *Refutation of all Heresies*. His account of the career of Callistus. Christian writers on the state of affairs in the Christian communities. Spread of Christianity (especially in Rome) in the first and second centuries. Relation of Christians to the general population. Spread of Christianity amongst the upper classes dates from the time of Commodus. Christianity rarely mentioned and little known up to the third century. Heathen converts of rank before the reign of Commodus. The supposed relations between Seneca and the apostle Paul. The period from Theodosius to Justinian. Christianity treated with contempt up to the third century. The long death-struggle of paganism a proof of its vitality. Pagan elements which survived the downfall of paganism 170-214

III PHILOSOPHY AS A MORAL EDUCATOR 215-281

The connexion of ancient morality with religion and the supposed dangerous effect of

anthropomorphism. The example of the gods alleged as an excuse for sin by 'sophistic'. Nature of ancient as contrasted with Christian morality. Relation to the deity and mankind. Moral philosophy. Knowledge the foundation of happiness. Happiness. Resignation. Pagan morality recognized by the Christians. Clement of Alexandria. Spread of Greek philosophy in the Roman world. Opposition to philosophy. Antipathies due to the Roman national character. Philosophy disliked by the authorities. Persecutions of philosophers. Change after the death of Domitian. Philosophy in favour under Marcus Aurelius and Septimius Severus. Attempts to represent philosophy as harmless to the government. Seneca. Philosophy disliked by the masses. Most uneducated and many educated men regarded it as useless. The contrast between rhetoricians and philosophers. The elder Seneca. Quintilian. Fronto. Lucian. Aristides. Opponents of philosophy appeal to the immorality of its professors. Pseudo-philosophers in Rome and Greece, especially under Marcus Aurelius. The Cynics. Philosophy recognized amongst the Romans as a guide to morality. Differences of opinion as to the amount of philosophical training required. Roman sympathy for philosophy. The school of the Sextii. Spread of Stoicism, Epicureanism, and other systems amongst the Romans. Philosophy usually begun in early youth. Logic and Dialectic. Physics. Ethics. The teachers' right and obligation to supervise their pupils' manner of life. Teachers of philosophy under three aspects. (1) As educators and spiritual advisers in distinguished families. Lucian's description of their treatment. Philosophers at court. (2) As heads of public schools. Instruction in philosophical schools unsatisfactory. Both pupils and teachers in part responsible for the failure. Flowery language and eagerness for applause. (3) Philosophers as moral missionaries and popular

CHAPTER I

BELLES-LETTRES

POETRY AND ARTISTIC PROSE

IN the following investigation an attempt will be made to show that the influence of poetry on education in general in later Roman times was much more comprehensive and far-reaching than in modern days. For this purpose it will be necessary to obtain an idea of the relation of the educated world to poetry, the mission of the latter, the resulting position of poets, and lastly the substitution of artistic prose for poetry,

The relation of the educated world to poetry was in great measure determined by the instruction given to youth, the aims and methods of which were entirely different from those of to-day. The aim of the modern instruction of youth is to put him in the way of defining his attitude in regard to the most important branches of human knowledge, to facilitate, as far as possible, his understanding of the manifold works of science, and to render him capable of taking his part in them. On the other hand, in antiquity its task was far simpler, since the branches of learning now taught in schools did not exist at all or only in a rudimentary condition, or were not considered as forming part of a general education. The development of the creative faculties, not increased power of receptivity, was the object in view. Education was not intended to facilitate the acquisition of comprehensive knowledge, but of special excellences; of a perfect mastery of linguistic expression; of the artistic employment of words to set forth ideas in a clear and persuasive manner; of the choice of the most suitable and elegant phraseology.

In republican times, when language, far more than knowledge at the present day, represented 'power'; when, as Tacitus says, 'no one attained great power without the aid of elo-

quence', this is easy to understand. But although political eloquence was reduced to silence after the downfall of the republic, the lively susceptibility of the southerners to the 'living word' and all the habits of ancient life still rendered necessary to a certain extent in all cases public and spoken utterances; and even under the empire the relation of the written to the spoken word, as far as their importance and influence on each other were concerned, was inverse to that in which they stand in the modern world. 'It is by the power of language', says Diodorus, 'that the Greeks are superior to the barbarians, the educated to the uneducated; by this alone one man can be superior to many'. 'It is easy', says the elder Seneca, 'to pass from eloquence to all other arts and accomplishments; it equips even those, whom it does not train with special reference to itself'.

Eloquence was indispensable not only for advocates and teachers, but also for higher officers or functionaries, for the senator or statesman, and, generally speaking, for all who aspired to a prominent position in life. The best standard of the value attached to it in imperial times, the best proof that it was even then regarded as the most important element in education generally, is the fact that it held the first place in the different branches of instruction, and long remained the only one for the teaching of which the state considered it its duty to provide. The first public professorships founded by the government in Rome and endowed with an ample salary (100,000 sesterces) were those of Greek and Roman oratory. The emperor, who imposed this burden on the treasury and summoned Quintilian, 'the glory of the Roman *toga*',¹ to the Roman chair, and made him 'the chief controller of the unsteady youth', was Vespasian, the economical ruler, the inveterate opponent of all ideal tendencies, in whose eyes practical needs were everything. Soon, not merely the large cities of Italy (at least about the middle of the second century), but even many smaller towns and the provinces had their professors of eloquence appointed by the communities; the largest no doubt, like Rome, had chairs of both Greek and Latin.

An unremitting and exclusive study of poetry prepared the way for the teaching of eloquence. The poet 'formed the stammering lips of the child'; reading and elucidation of

¹ Referring to his practice as an advocate, when it was necessary to wear the *toga*.

the poets was almost the only subject of school instruction for the rising generation. On the other hand, only a trifling knowledge of music and geometry was recognized as necessary or desirable; the former, instruction in which was frequently limited to theory, seems to have owed its admission into the curriculum to its connexion with poetry, which was far closer than in our own days. The youthful mind was also introduced by poetry to some other branches of learning—geography, astronomy (which in both Greek and Latin furnished themes for poetical descriptions), philosophy, the history of literature, and history proper, in which legend and mythology were generally included. At the same time children were intended to adopt and assimilate the doctrines of morality and worldly wisdom from the poets, whose maxims were probably collected for this purpose in numerous selections especially adapted for school use.

Where a higher education was aimed at, the instruction at school of course included Greek as well as Latin poets. It began with Homer, a course approved by Quintilian; 'for although riper years were necessary for a complete understanding of his poetry, every one would read him more than once'. Of other poetical works he mentions tragedies and lyric poems; he would apparently only exclude those which might offend the scrupulous, for example, elegies; he especially recommends Menander, whose pieces were read in boys' and girls' schools in Ovid's time. Even in the last days of antiquity Homer and Menander were given to boys beginning Greek. The father of the poet Statius kept a school at Naples, which, as his son assures us, was attended not merely by boys from the neighbouring towns, but also from Lucania and Apulia. At this school Homer, Hesiod, Theocritus, Pindar, Ibycus, Alcman, Stesichorus, Sappho, Corinna, Callimachus, Lycophron, Sophron and other poets were read. Certainly, such an extended study of Greek poetry outside of Greek countries would hardly have been possible, except in a city like Naples, where the Greek language and manners still held their ground; but it may fairly be assumed that every educated man, probably when he left school, had some acquaintance with the most important Greek poets. This is shown by Seneca's story of Calvisius Sabinus, who, to appear learned, made his slaves learn the poets by heart from which he was fond of quoting; in

addition to Homer and Hesiod, he mentions the nine lyric poets.

We know nothing further as to the choice of the Greek poets for school instruction, whether or to what extent it varied at different periods ; but we do know that the Latin poets read at school in the second century were not the same as those read in the first ; a change due to the revolution in literary and artistic taste, which began after the time of Nero and was complete at the beginning of the second century.

In the first century, Virgil was the first Latin poet put into the hands of the young ; and his poems were the foundation and the main subject of the Latin course, as those of Homer of the Greek. Next to him probably Horace was most read ; even at the beginning of the second century their busts usually adorned the schoolroom ¹. The grammarian Quintus Caecilius Epirota, a freedman of Cicero's friend Atticus, is said to have been the first to introduce the most modern poets as a part of the curriculum in his school, opened after the death of his patron the poet Cornelius Gallus (died 26 B.C.) In this he read and commented on the poems of Virgil (evidently before the death of the latter in 19 B.C.) and other living poets, which gained him from Martial the name of ' nurse of poets in swaddling clothes '. But Caecilius probably only established as the rule what had hitherto been the exception ; for Horace, in a satire written several years later, declares it is folly for a poet to desire the applause of the multitude and to feel flattered at his poems being read in second-rate schools, where, to all appearance, after this period the works of the most modern living poets were read by preference. We may conclude that Lucan's epic was read at school immediately after its publication from the fact that in Vespasian's time poetical ornament ' from the sanctuary of Virgil, Horace, and Lucan ' was required of the orator ; this is further confirmed by the express statement of Suetonius and the extraordinary care taken by the booksellers in the get-up of his works, the sale of which, says Martial, was the best proof that he was a poet. Persius says it is a fine thing for a poet to have his verses dictated to a number of curly-headed boys ; and the statement of the scholiast, that this refers to Nero's poems, which at that time were in general use in schools, is in

¹ Juvenal, vii, 227. According to the scholiast, however, the reference is to copies of their works.

itself very probable. At the conclusion of his *Thebaid*, Statius could assert that this poem, the result of twelve years' labour, was already eagerly studied by the youth of Italy. Martial, whose poems were of course entirely unfitted for educational purposes owing to their indecencies, represents his sportive Muse as asking him whether he felt inclined to put on the *cothurnus* of tragedy or celebrate wars in epic, 'that a pompous schoolmaster might read him in a hoarse voice, and that he might become the aversion of growing girls and good young men'.

But at that time it had long been a subject of dispute in literary circles, whether the preference should be given to ancient or modern literature and of course the out-and-out supporters of the former would not hear of the latter in the schools. As early as the time of Vespasian there had sprung up a keen opposition to the extravagances, unnaturalness and affectation of modern prose. Quintilian, whose authority undoubtedly was decisive in many quarters, was on the side of the opposition. On entering upon his professional duties, he found Seneca, the most brilliant of the modern writers, the object of the universal and enthusiastic admiration of young men, just because of his dazzling and misleading errors, which his imitators multiplied and outdid. Quintilian and those who thought with him strove for and brought about a regeneration of prose on the basis of the Ciceronian style, which, remodelled in conformity with the needs of the time, gained in mobility, colour and brilliancy.

But even then some of the archaists were greatly dissatisfied. They believed it was necessary to go back about a century, to find the models by which the degenerate taste could be re-educated; they extolled the elder Cato, the old chroniclers, orators such as Gracchus, and the poets of the time of the Punic wars (Naevius, Ennius, Plautus, Accius, Pacuvius, Lucilius and their contemporaries), and of course also wanted to see them introduced into the schools. About the year 90 this tendency had gained ground to such an extent that Quintilian recognized the last demand as legitimate. He was too moderate and liberal-minded, his taste was too fine for him to take sides in the dispute, least of all with the archaists; his views were far more modern; he did not share their enthusiasm for Plautus and Ennius, and only accorded

the latter the respect due to what is consecrated by age. In his review of the standard authors he does not even mention Cato or Gracchus. However, he admitted that it was proper to read the old poets at school. According to him, their works were certainly well adapted to nourish and promote the development of a boy's mind, although their strength lay rather in their truth to nature than in their art ; but they were especially calculated to increase the *copia verborum*, tragedy by its seriousness and dignity, comedy by its elegance. Their composition also, regarded artistically, was more careful than that of most of the moderns, who considered sententious phrases the chief beauty of poetical works. Consequently, it is in the works of the older writers that moral earnestness and internal vigour must be looked for, since the language of the moderns has degenerated owing to its ultra-refinement and affectation. Finally, Quintilian appeals to the example of Cicero and other great orators, who certainly knew what they were about, when they introduced into their speeches so many passages from Ennius, Accius, Pacuvius, Lucilius, Terence and others. To all appearance, it was under Hadrian that the archaists gained the upper hand. The fact that the Emperor, who preferred Cato to Cicero and Ennius to Virgil, gave them his support, was bound to ensure their supremacy ; and under the two Antonines they appear to have obtained almost absolute control over literature and the schools, to judge from the reputation enjoyed by such a nonentity as Fronto, their most extreme representative.

But even the members of this party held divergent opinions ; the most exclusive and absolute veneration for the ancients, combined with equal contempt for the moderns, is to be found in Fronto. In his correspondence with his royal pupils, Marcus Aurelius and Lucius Verus, which is full of quotations from ancient literature, the names of Virgil and Livy will be looked for in vain ; Horace is mentioned once. Only after the accession of Marcus, when begging permission to resume his former duties as teacher, does he mention Seneca and Lucan, and then only to issue a most serious warning against both. He then expresses, with indescribably comic apprehension, his serious anxiety on the subject of a certain penchant for the modern exhibited by Marcus in one of his speeches. He allows that there are many beauties in Lucan, but ' little pieces of

silver are to be found even in sewers ', if any one likes to rummage for them. The safest thing is to abstain from reading such works altogether, ' for on slippery ground there is always more danger of tripping '.

Aulus Gellius, on the whole, held the same views as Fronto ; he thought it necessary to mention Seneca once, in order to pronounce strongly and decisively against him. He thinks it will be enough to quote the offensive criticisms of this ' insipid and insensate ' fellow upon Ennius, Virgil and Cicero ; Lucan he never mentions. But Gellius, although a great pedant, was by no means without taste and was less narrow-minded than Fronto ; he admired Virgil as much as Ennius. Certainly, he mentions no other poets of the Augustan age except Horace, whom he pays the honour of citing a passage in support of the name of a wind.

Thus, in the course of about a hundred years, a complete revolution in literary taste had taken place ; the prose and verse writers who had been admired and imitated in the first century were despised and ignored in the second, and *vice versa*. The number of poets which the two periods united in admiring, appears to have been small ; in addition to Virgil, whose greatness even the archaists never contested, a special favourite was Catullus, for whom even the moderns had an affection, and whom Martial imitated before all others. Juvenal is the last of the moderns ; he had a lively recollection of how Statius, the celebrated epic poet of the party in the time of Domitian, delighted all Rome by the announcement that he would read his *Thebaid* ; how all flocked to hear him and were enchanted ; how the seats collapsed from the frenzied stamping of the audience. But a generation later, Statius was completely forgotten, and in the time of Hadrian Lucan had long ceased to be read in schools. Nevertheless, several of the moderns still had friends and readers ; thus, Aelius Verus was especially fond of Ovid and Martial (whom he called his Virgil), who was one of the poets most frequently read to the last days of antiquity. But the friends of this kind of literature cannot have been very numerous in the second century. Ennius, to whom Quintilian thought he had shown sufficient respect by allowing him to pass as a venerable relic of antiquity, was now in every one's mouth. Reciters of Ennius (*Enneanistae*) toured Italy, and Aulus Gellius tells how one

of them read the *Annals* of Ennius in a theatre at Puteoli, amidst the enthusiastic applause of his audience. Grammarians (*φιλόλογοι*) had above all to be strong on Ennius. In a letter (written in 161) to his former pupil, the Emperor Marcus Aurelius, who had gone for a few days to Alsium to recruit, Fronto pictures the emperor reading for amusement after his siesta, 'seeking refinement from Plautus, taking his fill of Accius, enjoying the charm of Lucretius, or firing his imagination with Ennius'.

It goes without saying that the few poets of talent whom that age produced moved on the lines of the ancient authors. The poets Annianus and Julius Paullus, friends of Gellius, were intimately acquainted with the ancient language and literature, the second being one of the most learned men of his day; another learned poet, a friend of Fronto, was well read in Plautus and Ennius. A short but very characteristic specimen of archaistic poetry has been preserved in the epitaph of a certain Marcus Pomponius Bassulus, chief municipal magistrate of Aeclanum, written by himself after the manner of Plautus in elegant old-fashioned Latin, and in a style commendably free from exaggeration ¹.

Naturally this radical revolution in taste brought about a similar change in the school curriculum; the modern poets were either entirely displaced by the ancient or at most tolerated by their side. In Quintilian's time the old poets were probably read in many schools concurrently with the modern; when Gellius went to school, Ennius was read everywhere.

But there were still poets who were put into the hands of the young, read, explained and learnt by heart in school. Poetry at that time was not an 'extra', an occupation for spare hours; it was not looked upon as an amusement, but as a subject for serious study. It is difficult to estimate the effects of a system of education, which regarded the works of the national poets and of those of kindred peoples as the most important instrument of culture, and as almost the only nourishment of the youthful intellect. It necessarily filled the memory with poetical turns and expressions; roused and elevated the activity of the imagination by a wealth of

¹ See *Corpus Inscriptionum Latinarum*, ix., 1164. Mommsen in *Hermes*, iii. on historical grounds considers Bassulus a near contemporary of Trajan; Ritschl, from considerations of style, assigns him to the second (or perhaps the third) century.

imagery ; early developed the sense of beauty of form and artistic representation, and made it second nature for impressionable minds. The effect of these impressions, firmly imprinted on the mind, at a time when it is most susceptible, must have lasted a lifetime.

In addition to this, the professors sometimes (perhaps frequently) were poets themselves, and thus were able to persuade, and actually did persuade, their pupils to try their hand at poetry and assisted them in their attempts. Learning and poetry were not antagonistic at Rome, any more than formerly at Alexandria and subsequently in the age of humanism ; in both places it was quite an ordinary thing for the same person to be both savant and poet ; among the philological celebrities of Alexandria, Aristarchus, who disdained poetry, was a prominent exception. ‘ Only a mind rendered fruitful by a powerful stream of literature ’, says the poet in Petronius, ‘ is capable of conceiving and bringing forth a poetical work ’. One of the most usual titles of honour bestowed on the poets was ‘ learned ’, not in our sense of the word, but implying a perfect knowledge of the forms and rules of the art, acquired by the study of the best models. The oldest schoolmasters of Rome, such as Ennius and Livius Andronicus, were poets, and this was probably often the case in later times. Valerius Cato, surnamed ‘ the Latin siren ’, who lived in the last days of the republic, was considered an excellent teacher for students of poetry, a man, ‘ who not merely expounded, but made poets ’. Lucius Melissus, appointed by Augustus superintendent of the library in the *porticus* of Octavia, was also a poet and invented a new kind of Latin comedy. The father of the poet Statius had gained the prize in poetical contests not only in his native city Naples, but also in Greece ; he had sung of the burning of the Capitol in the civil war of 69, and intended to make the eruption of Vesuvius in 79 (which destroyed Herculaneum and Pompeii) the subject of a poem ; his son enjoyed his advice and guidance in the composition of his *Thebaid*.

But even without direct encouragement, lads possessed of a certain taste and gift for form were bound to find in this intensive application to poetry at school a sufficient incentive to poetical attempts of their own ; to all appearance precocity was rather the rule than the exception. Catullus had already

written his first love-songs 'when first the white robe (the *toga virilis*) was bestowed upon him'. Ovid began to compose still earlier. When a mere boy, the Muse secretly attracted him, and verses flowed from his pen long before he was of age; he read his first poem in public, 'when his beard was just beginning to sprout'. Propertius began his attempts at poetry after assuming the *toga virilis*. Virgil wrote his *Culex* when he was sixteen; Lucan (A.D. 39-65) was only fourteen or fifteen when he composed his *Iliacon*, the subject of which was the same as that of the last three books of the *Iliad*. It was in existence till a late period, as well as another poem (*Catachthonion*) on the underworld; in his twenty-first year he was an unsuccessful competitor with a panegyric on Nero for the prize at the *Agon* founded by the latter, and began the *Pharsalia* a year later. The boyish productions of Persius were destroyed by his mother after his death on the advice of Cornutus. Nero also when a boy had shown by his poems that he possessed the elements of a good education, and Lucius Verus at the same age was equally fond of writing poetry. The poems written by the first Gordian (apparently before he entered the rhetorical school), which included an *Antoninias* (the lives of Antoninus Pius and Marcus Aurelius Antoninus) were still extant in the time of Constantine. Martial was glad to find the poetical trifles of his schoolboy days, which he had almost forgotten himself, for sale at the book shops; the reputation of Serranus, who died young, was made by his boyish poems which caused great things to be expected of him. The elder Statius excited universal admiration by taking part in a poetical competition when a boy, and parents pointed him out to their children as an example; the rhetorician Publius Annius Florus, when a boy, competed for the Capitoline wreath with a poem on the Dacian triumph, and the eleven year old Quintus Sulpicius Maximus with improvised Greek hexameters; the thirteen year old Lucius Valerius Pudens of Histonium obtained it (in 106) by the unanimous verdict of the judges.

In olden times Greek poets such as Antipater of Sidon and Licinius Archias of Antioch were famous for their improvisation, an accomplishment which was very common at Tarsus in the time of Strabo. It was probably also frequently practised in Rome, where it was facilitated by the stereotyped turns and formulas in which the language of poetry abounded,

and the easily accessible store of metaphors and similes, common places, and mythological parallels ; again, it was recommended as a means of acquiring a complete mastery of expression and metres. The mimograph Publius of Syria is said to have challenged the dramatists to a contest in improvisation on subjects set by each side ; by his skill in the art of his native land he defeated all his competitors, including his most important rival Laberius. Quintilian speaks of improvisation as an art much practised in his time. Lucan improvised an *Orpheus* (in hexameters), the subject apparently being set to several poets at the same time. Martial, who combined a ready facility in the treatment of form with the capacity of striking the most varied notes, no doubt improvised a considerable number of his epigrams, at banquets, and on given subjects. The poems of Statius thrown off on the spur of the moment on special occasions, were at least improvisations in the wider sense of the word. Apollinaris Sidonius in addition to shorter improvisations, also mentions a longer one, in which he competed with three friends at a banquet in the treatment of the same theme in different metres.

Thus prepared, lads and young men passed into the rhetorical schools, where, partly under the guidance of the professors, they studied prose instead of poetical models. Here also, of course, the prevailing literary tendency exercised the same influence upon the choice of authors as in the boys' schools. For young beginners Quintilian recommended Livy and Cicero (Sallust for the more advanced), and found it necessary to issue a warning against putting Gracchus and Cato into the hands of lads. Fronto, on the other hand, recommended these authors and the like to the young Marcus Aurelius, and the prince, who was then in his twenty-second year, entirely shared his master's taste ; he early gave up the study of Horace and devoted himself exclusively to Cato, while at the same time he found great edification in the speeches of Gracchus. Cicero, however, although not exactly an orator after Fronto's heart, was also recognized by the archaists as a model, and considered by many not inferior to Gracchus, to the annoyance of Aulus Gellius ; even in the second century he maintained his place in the rhetorical schools at least as firmly as Virgil in the grammatical.

Instruction in the rhetorical schools consisted mainly of

special exercises, gradually increasing in difficulty, under the teacher's guidance. These exercises, starting from the subjects and ideas derived from the works of the poets in the grammatical schools, were in a measure admirably adapted to foster and develop the poetical inclinations which had been already aroused. At first the pupils wrote on given subjects. In narrating historical events, on which they had to try their hand first, they were accustomed to insert excessively detailed descriptions of every kind 'in imitation of poetic licence'; however, intelligent teachers preferred these youthful vagaries, which at least showed ability, to meagreness and aridity. The next exercises consisted of an examination of the probability or improbability of legends and legendary narratives: e.g. whether it was credible that a crow really perched on the head of Valerius in his duel with a Gaul, flapped his wings in the latter's face and pecked out his eyes; the nature of the serpent, which is said to have begotten Scipio, or the wolf of Romulus and Remus; Numa's Egeria; and similar themes which ancient Greek history in particular provided in abundance.

Further: the praise or censure of famous men; so-called commonplaces, especially dealing with the foolish and vicious types of mankind (the adulterer, the gambler, the debauchee, the pimp, the parasite) or their varieties (the blind adulterer, the impoverished gambler, the old debauchee); comparisons, e.g. of town and country life, of the legal and military professions, of marriage and celibacy; investigation of the origins of certain customs and ideas, e.g. why Venus is represented as armed by the Lacedaemonians, why the boy Cupid was conceived as having wings and equipped with bow, arrow and torch. These things for the most part readily adapted themselves to poetical treatment, the last named for instance being actually the subject of one of Propertius's elegies, while the superior advantages of a country life were a favourite theme of the poets.

After these and similar preparations, the pupil began to attempt oratorical exercises, the so-called 'declamations'. Beginners delivered monologues in the rôle of some well-known historical personage, in which the reasons for and against an important and decisive resolution were set forth (such monologues were called *suasoriae*). The characters

and the situations were sometimes taken from poetry, e.g. Agamemnon deliberating whether he should sacrifice Iphigenia, but in the majority of cases from ancient Roman history, e.g. Hannibal deliberating whether he should lead his troops against Rome, Sulla whether he should lay down the dictatorship, Cicero whether he should apologize to Antony in order to save his life. Persius, when a small boy, often rubbed his eyes with oil, so as to be able to shirk school on the plea of sore eyes, if he did not feel inclined to learn the pathetic speech of Cato before his suicide—a speech in which an intelligent teacher could find nothing to praise, but which the father of the hopeful son invited his friends to hear and to which he himself listened ‘in perspiring ecstasy’. Such tasks, which required young people to identify themselves with men of the past and to reproduce the emotional tension of the crises of their lives could only be adequately performed by true poets; nevertheless, they could not fail to arouse the youthful imagination in various ways and to develop in it an activity approximating to the poetical.

This, however, was the case to a far greater extent in the last, most difficult and most protracted exercises of the rhetorical school. These were entirely dramatic in character and were called *controversiae*, i.e. disputes in which the pupils took sides, as accusers, defenders, or advocates. In early times, cases of recent occurrence or known from history were selected, such as the following mentioned by Suetonius. Several young men, who had gone on an excursion from Rome to Ostia, saw some fishermen on the point of drawing in their nets. They bought the catch in advance for ready money. After a long wait, the net was pulled up, and found to contain no fish, but a basket of gold neatly tied up. Both parties accordingly laid claim to the treasure. In another case, certain slave-dealers, having put their cargo ashore at Brundisium, in order to cheat the custom house officers out of the duty for a beautiful and valuable slave, dressed him in a purple-embroidered *toga*, and hung a golden *bullā*¹ round his neck. On their arrival at Rome, the fraud was detected and the freedom of the boy demanded, since his master,

¹ A round or heart-shaped box worn round the neck by free-born children; those of wealthy parents wore a golden *bullā*, those of poor parents one of leather.

by dressing him in that manner, had practically renounced the right of ownership.

But such cases soon came to be regarded as not sufficiently interesting. Criminal cases took the place of property disputes, and fictitious cases were substituted for real ones : questions of civil law and history form only a very small part of the extant collections of *controversiae*, and even those of an historical character have been garbled to produce a greater effect. Certainly, sensible masters demanded that fiction should resemble reality as far as possible ; but to all appearance their resistance to the prevailing taste, which clamoured for thrilling and piquant situations, strong seasoning and drastic effects, was practically without result. This is shown by the first collection of *Controversiae* (that of the elder Seneca in the time of Augustus) and even more by succeeding ones, as well as by the repeated complaints of the predominance of the nonsensical in the rhetorical schools. According to Petronius, the fault lay, not with the teachers, who, if they did not wish to see their classes empty, were obliged to do as others did, but in the vanity of the parents. Quintilian himself considered the exclusion of all 'incredible and poetical subjects in the proper sense of the word' too severe and impracticable ; it was necessary to allow the young people some recreation and amusement, provided that the subjects although emotional and full of bombast, were not foolish and ridiculous.

Unfortunately, the *controversiae* were often to a great extent both foolish and ridiculous. For the most part, even if not actually contrary to reality, they were far removed from it ; they made a rule of what should at most have been allowed as an exception ; they were on the borderline of possibility, or even overstepped it. In time the rhetorical school created for itself a fantastic world of its own, separated from practical life by a deep gulf which could not be bridged. The existence of imaginary justice, of imaginary, even impossible, laws was assumed ; for instance, ingratitude, or a crime not provided for by the law was admitted as actionable. The persons and circumstances of these fictions were purely imaginary ; it never occurred to any one to regard them as pictures of real life. It may appear strange that, during the last periods of imperial despotism, when men's minds

bent beneath the yoke of the most fearful oppression and the last trace of freedom of speech had disappeared, tyrants were the stock characters in the *controversiae*, and 'declaimers' breathed hatred of tyrants and extolled tyrannicide. But these tyrants, 'who issued edicts, ordering sons to execute their fathers', were in reality as harmless as marionettes, except to the teacher, 'whose pupils, in a full classroom, one after the other put their favourite tyrant to death'. If Caligula banished the rhetorician Secundus Carinas for such a declamation, if Domitian put Maternus to death for the same reason, it must be remembered that Caligula was capable of any extravagance, and that Domitian welcomed any excuse, however trifling, for an act of violence; these two instances are exceptional, and there is no evidence that they in any way affected the choice of such subjects.

Next to fearful tyrants, brutal pirates were the favourite subject in the rhetorical schools, 'standing on the bank rattling chains'; sometimes they had lovely daughters, as in the following story. A young man, who has fallen into the hands of the pirates, in vain beseeches his father in a letter to ransom him. The daughter of the pirate chief makes him take an oath to marry her, if he gains his freedom. He swears; she elopes with him, he returns home and marries her. The marriage of his son with a wealthy orphan is proposed to the father, who calls upon the son to consent and to repudiate the pirate's daughter. The son refuses, and is himself repudiated by the father.—As a rule, the actors on both sides were involved in the most painful and strenuous conflicts between equally sacred obligations, equally strong and legitimate feelings and inclinations.—A sick man asks his slave to give him poison; he refuses; in his will he orders that his slave should be crucified; the slave appeals to the tribunes. In a civil war, the father and brother of a woman are on one side, her husband on the other; she follows the latter. He is killed; the wife flees for refuge to her father, who spurns her; on her asking, 'How am I to appease you?' he replies, 'Die!' She hangs herself at his door. Whereupon the son proposes that the father should be declared insane.—The father of three sons, having lost two by death, becomes blind by excessive weeping. He dreams that, if the third son dies, he will recover his sight. He tells the dream to his wife,

who tells it to his son, who immediately hangs himself. The father recovers his sight, but repudiates his wife, who disputes his right to do so.—A husband repudiates his wife for adultery ; their son demands and receives from his father a sum of money, ostensibly for the support of a mistress, but really for his starving mother ; the father finds it out and repudiates the son, who defends what he has done.

The most striking contrasts were freely introduced. Stock figures were the poor and the rich man, mutually hostile (for instance, the poor man's bees gather honey in the rich man's garden, who poisons the flowers, and so kills the bees) ; on the other hand, their children are often fond lovers. Maidens of noble birth are sold for the brothel, dishonoured maidens are given the choice between the punishment of the criminal or marriage with him ; young men of noble birth are compelled to enter the disgraceful profession of gladiator, e.g. to obtain an advance of money to bury a father. Terrible afflictions overtake individuals and whole countries. The plague especially was a favourite subject, which according to the oracle can only be stayed by the sacrifice of some young maidens ; a country is visited by famine and the inhabitants are finally reduced to eating the corpses of the victims. Bodily and mental afflictions of an exceptional nature, such as blindness (and its wonderful cure) and insanity ; miracles (a woman brings forth a negro child and is accused of adultery) ; cruel punishments (hurling from a rock) and torture ; murder and suicide, especially by hanging and poison (the cutting of the rope and the pouring out of the poison were stereotyped *motifs*) ; horrible crimes such as parricide and the mutilation of children, trained to beg by one who lives on what they receive ; but especially family horrors of all kinds (of course 'stepmothers, more wicked even than in tragedy' are frequent characters)—such were the favourite ingredients for the preparation of strongly effective *controversiae*, which were so greatly in demand, and which always elicited thunders of applause in the schools.

It is remarkable and at the same time the clearest proof that these fictions partook of the character of novels, that Seneca was laid under contribution more than any other ancient authority in a collection of novels and anecdotes widely circulated in the middle ages, the *Gesta Romanorum*.

The 'enchanters', who subsequently played an important part in these themes, were perhaps only introduced later, for Quintilian is the first to complain of them, while they are not mentioned in Seneca, Petronius and Tacitus ; on the other hand, in the collection which bears the name of Quintilian, there is a case of hatred excited by a magic potion, an astrological prophecy, and a really excellent specimen of this class, 'the enchanted tomb'. A mother, who has lost her son, is visited nightly by the latter in a dream. She tells her husband, who gets a magician to cast a spell over the tomb ; the visitations cease ; but the wife then brings a complaint against her husband, 'on the score of ill-treatment'. Perhaps the Greek rhetorical schools are the source of the stories of magic. The magician who attempts to kill by enchantment another who has seduced his wife, and being unsuccessful tries to commit suicide, is a common subject for a theme in Greece towards the end of the second century.

In the Greek rhetorical schools, the subjects of oratorical exercises differed essentially in character. Certainly there were 'declamations' of *controversiae* and to all appearance on the same themes ; the magician, the tyrant, the tyrannicide, the debauched woman, and the poor man are occasionally mentioned as typical figures. But the most difficult and most profitable task for advanced pupils and the masters themselves was clearly not *controversiae*, but persuasive or dissuasive discourses after the manner of the Latin *suasoriae*, speeches in defence or accusation, epideictic, i.e. show speeches, which will be spoken of later. This difference of method had its origin in the totally different appreciation of eloquence by Greeks and Romans. The Romans looked upon it principally as a means to an end, that of upholding one's own interest against all opposing interests, especially in a court of justice ; whereas the Greeks of that age considered beauty of form a sufficient end, and skill in its manipulation a desirable and much admired accomplishment.

In Rome, Italy, and the western countries, the great majority of educated persons no doubt attended only the Latin rhetorical schools, or at least preferred them ; most of the large towns, however, also had paid teachers of Greek oratory, notably Rome, where the Athenaeum, founded by Hadrian and kept up by his successors, had a separate chair for this subject.

Further, it may be assumed that in western countries, Greek rhetoricians adapted themselves to the system that prevailed in the Latin school; thus, according to Seneca, they competed with one another in the treatment of the same themes, and we know that Isaeus, on his first appearance in Rome, asked for controversial themes for his improvisations. Thus, this system, especially the 'declamation' of *controversiae*, ever exercised a most important influence upon the character of Roman education at the time; the fact that in most cases the school-course ended with these studies, and that the pupils passed at once 'from the fairy tales of the poets and the epilogues of the rhetoricians' into the realities of practical life, there to test the value of what they had acquired at school, considerably increased this influence.

Further, rhetorical themes were also treated in a poetical form. There are extant examples of speeches in verse, most commonly improvised, delivered by persons in certain situations (*ῥητορικαὶ, ethicae*, an exercise for beginners), in fact, *controversiae* and *suasoriae* in verse. To the last days of antiquity the systems and exercises remained the same in both Greek and Latin rhetorical schools; even themes, which assumed pagan belief and worship, were constantly handled by Christian pupils; evidently, opinions otherwise strictly tabooed were regarded as integrant elements of both rhetorical and grammatical instruction.

The effects of this method of instruction, common to all educated persons, are clearly manifest in the literature of the period. Only superior and specially keen intellects could entirely avoid the dangers, seductions and devious ways of this method of teaching rhetoric. In the case of the majority of pupils, the continuous striving after effect, the habit of intoxicating themselves with phrases and working themselves up into a permanently emotional frame of mind, was bound up to a certain point to make an essentially unreal eloquence a kind of second nature; the more so as it was just the artificial and affected, the dazzling and surprising, the risky and abnormal, which was assured of the loudest applause. Even the greatest intellects of the time could not entirely escape these influences, which chiefly affected the poetry of the first century, which, lacking all elasticity of its own, was rarely able to rise above the pompous stiffness of rhetoric.

Quintilian's opinion, that Lucan, the greatest poetical genius of his time, was more deserving of imitation by orators than by poets, was certainly justified. But while poetry has a rhetorical tinge, that of prose is poetical, an equally necessary result of the system of education. The grammatical school made the boy at home in the world of poetry; the rhetorical school did not estrange him from it. The themes set, with their melodramatic situations, highly romantic motive and adventurous characters, were bound to lend wings to imagination, and to claim poetical handling; like the subject, the manner of treatment must often have reached the borderline of poetry or have overstepped it. The rhetorician Arellius Fuscus, one of Ovid's tutors, was fond of indulging in absolutely poetical descriptions (to judge from a specimen in Seneca) and unblushingly on occasion borrowed straight from Virgil. Inversely, Ovid reproduced many sentences of another of his teachers, the rhetorician Porcius Latro, almost word for word. According to Seneca, Ovid's own speeches in the school where he was considered an admirable 'declaimer' were nothing but verse broken up into prose, which was probably the case with many other pupils similarly trained. These rooted habits of the school necessarily held their ground in practical life. 'At the present time', says the apologist of modernism in the *Dialogus* of Tacitus, 'poetical beauty, which must be derived from the sanctuary of Virgil, Horace and Lucan, is required of the orator; the speeches of the present are related to those of the past as the modern temples glistening with gold and marble to the old erections of rough freestone and shapeless bricks'. We may believe with the poet in Petronius that many who had tried their hand at the bar, took refuge in poetry as a haven of rest, foolishly thinking that it was easier to put together a poem than a *controversia* embellished with sparkling aphorisms. Poetry was akin to eloquence; it was reckoned among the forms of 'speaking well' in the widest sense of the word, and 'eloquent' (*facundus*) was an extremely common and honourable epithet of a poet. As a result of the mutual relations and points of contact between poetry and prose, the prose of the most matter of fact and unpoetical people in the world ever assumes fresh poetical colouring and is proof in itself that its intimate relation to poetry taught in school was permanently maintained. The

extremely poetical prose of Apulcius shows that the triumphant reaction of the archaists might modify, but could not entirely suppress these influences.

Lastly, it must be observed that a school education was more general in the first than in the second century. By degrees military merit and practical knowledge of business opened the way for the lowly born (and so frequently for the uneducated) to high positions, formerly confined to the descendants of families of the two highest orders. Thus provincials, only to a certain extent romanized, entered these orders in ever increasing numbers. For both these reasons school education among the upper classes ceased to be regarded as an indispensable requirement, or the lack of it as disgraceful or ridiculous. Augustus is said to have recalled a consular legate as insufficiently educated since he had written a word as it was pronounced by the lower classes. Yet, as the number of provincials in the senate increased, we may assume that fault was more frequently found with persons of high position in Rome itself for bad pronunciation and even errors of speech. During his quaestorship, Hadrian was laughed at for his accent when he was reading out an imperial speech. When Marcus Aurelius issued a command in the field in Latin, none of his staff understood him, apparently because his officers did not know how educated persons expressed themselves; indeed, Bassaeus Rufus, praefect of the Praetorian guard, a man of no education, remarked to the emperor that the man addressed knew no Greek. According to Cassius Dio, the aged consul Oclatinus Adventus could not read and was so poor a speaker that he pleaded illness whenever he had to transact negotiations. The statement in Philostratus, that the sophist Hadrian was loudly applauded in Rome even by the knights and senators, who did not understand him, seems to show that a knowledge of Greek had become rare amongst the two first classes.

In Rome itself, about the middle of the second century, the indications of the commencing decay of the Latin language were sufficiently numerous and alarming. The form and meaning of many words was doubtful and disputed; learned men held different views on the fundamental rules of grammar; expressions in use among the vulgar were heard in the mouths of advocates. The barbarisms, which

in the time of Severus made their way into public documents and work on stone, could already be found in individual private inscriptions. The feeling of increasing linguistic uncertainty and confusion, the effort to stem the tide of advancing barbarism, the similar exertions of the atticists in Greece incited the critics and friends of language and literature to zealous investigations in the ancient classics. The friends of Gellius busied themselves specially with these researches, by the aid of which they hoped to regain a surer footing, and to restore purity and clearness of expression. But these well-intended efforts could at best only affect a limited circle ; in the face of the preponderance of contrary influences at work since the third century throughout the Latin tongue, incessantly destroying language and intellectual culture, they were completely unimportant. This later period, however, is beyond the scope of this treatise ; let us return to the condition of letters in the first two centuries.

The fact that the period with which we are concerned entered upon the heritage of the most brilliant epoch of Roman poetry (the Augustan age), was a second element which, combined with the system of youthful instruction, gave poetry so important an influence on education generally. We need only mention Virgil, Horace, Tibullus, Propertius and Ovid (many other famous poets, such as Varius, are only known to us by name), in order to realize the brilliancy and wealth of poetical productions which matured side by side within the space of a single generation. All classes of poetry were represented—epos, ode, tender or passionate elegy and satire—idyll and poetical epistle, descriptive and didactic poetry. Even drama was included, although nothing likely to live was produced in that branch of literature ; the period of dramatic writing was finally past, and its plays are lost to us for ever. In all the other departments of poetry the results were perfect of their kind. Not that any one would ever think of ranking them amongst the highest poetical efforts ; no one can for a moment entertain any delusion as to their lack of originality and real genius, notwithstanding their abundant talent, their great dramatic power, their perfect grace, their pure and unerring taste, and their lofty culture. As the Muse had come from Greece to the ‘rude people of the Quirites, after they had conquered Hannibal’,

so also the new poets refused to walk in any other path than that of the Greeks and loudly and clearly professed themselves their followers. But in the first place, they chose as models, not the old poets, but such as were more within their reach, especially the Alexandrine; and in the second place, the understanding of Greek art had gained infinitely in depth and refinement. The result was that the contemporaries of Augustus reproduced the nobility and beauty of Greek form in quite a different manner from those of the Scipios and even of Sulla and Cicero, whose works must have appeared clumsy, formless and rough by the side of the new productions. Noble forms were created as standards in all departments for every mode of feeling and representation; the structure of the line and the art of composition were elevated to the height demanded by the knowledge of Greek art; but, above all, in the matter of language they did for poetry what Cicero had done for prose, and this was the greatest and most lasting creation of that period.

As Cicero was the founder of a prose adapted to increased culture, so the Augustan poets were the creators of a new poetical language. They developed the poetical power of expression of Latin in all directions in a manner formerly scarcely dreamed of, bestowed upon it wealth, variety and fulness, beauty and grace, vigour and dignity. They thus exercised an immense influence not merely on the prose and verse literature of the succeeding centuries of antiquity, but upon that of all later times, an influence which they will probably continue to exercise as long as literature exists. These poets were animated by a true and genuine Roman patriotism; they desired to secure for their nation the only possession for which they still envied Greece. To dispute with the Greeks for preeminence in the plastic arts or astronomy appeared unworthy of the great people which, more than any other, had proved its skill in ruling others, in 'sparing the conquered and vanquishing the proud'; but to appropriate their poetical artistic form was a lofty aim and one worth striving for. 'To secure the fame of this achievement for the great people and its native language was the main object for which the poets of the Augustan age so earnestly strove'; and so far as such a thing was possible, they succeeded.

In their efforts they were assisted by the consciousness

that they were not working for a single country and a single people, but for the human race; that their works would form part of the literature of the world. Ennius had been brought to write poetry for the rulers of Italy, Virgil and his contemporaries knew that they were writing for mankind in general; and indeed the outlook upon an horizon so immense was enough to make them giddy. The prophecy of Horace, that 'the most distant peoples would one day know his works', is well-known. It has been literally fulfilled, like that of Ovid, that the lamentations uttered by him in exile on the barren shores of the Euxine would one day traverse all lands and seas, and would be heard from East to West. They even lived to see their predictions in part fulfilled. Ovid could boast that the whole world read him; Propertius, that his reputation had penetrated to the inhabitants of the shores of the wintry Borysthenes. In fact, the works of the living poets were probably read wherever Roman teachers found their way.

The most exalted idea of the magnificence of the new political organization of the world-wide empire, the immensity of its resources and of the all-conquering influence of the Roman language cannot prevent our astonishment at the rapidity with which the Romans succeeded in 'uniting so many discordant and barbarous tongues by the bonds of intercourse'. Scarcely more than twenty years had passed since the complete subjugation of Pannonia, when Velleius Paterculus wrote his history; and already an acquaintance with the Roman language and writing was widespread in these rude, uncultivated and barbarous countries (the eastern part of Austria, especially Hungary). Roman literature had made its way into the older provinces of the West, as early as the time of Augustus. Livy began one of his later books with the declaration that he had already gained sufficient reputation and only continued his work to satisfy the demands of his restless mind; and this reputation at that time extended beyond Italy, for it is well known that it caused a Spaniard to travel to Rome on purpose to make the acquaintance of Livy; when he had achieved his purpose, he at once returned home. Even then the 'remainders' of new works at Rome were sent to the provinces. Horace sends forth the first book of his *Epistles* to the world with the pros-

pect of serving as food for book-worms unread, or of being shipped off to Ilerda (Lerida) or Utica, when thumbed and dirty by constant handling. The best books, which brought most profit to the retailers, were also sent over sea.

If then, the master-minds of literature in a certain sense lived to find themselves famous throughout the world, their ambition was most completely satisfied in Rome itself. There their poems, which in accordance with a custom recently introduced were recited by them before large audiences, were at once introduced into the schools, or sung at the theatres to the applause of thousands; and finally a comprehensive and active book-trade promoted their sale and multiplied their circulation. Virgil, who died before the publication of his *Aeneid*, had been so successful with his earliest poems (the *Eclogues*), that they were frequently sung on the stage; the actress Cytheris, frequently mentioned in the literary circles of the period, the mistress of Mark Antony and afterwards of the poet Cornelius Gallus (who sang her charms under the name of Lycoris), is said to have sung the sixth eclogue, in which Virgil extols the poetical fame of his friend Gallus. When Virgil happened to be present in the theatre on such an occasion, the whole audience rose and greeted the poet as respectfully as Augustus; in fact, such a distinction was as a rule reserved for emperors and members of the imperial household. When the poet during his later years, which were mostly spent in southern Italy (especially Naples), occasionally visited Rome and appeared in public, he was obliged to take refuge in a house from the crowd which followed him.

Certainly, the fame and popularity of Virgil among his contemporaries and posterity, and consequently the influence of his poetry, were greater than that of any other Roman poet, and indeed unexampled. His popularity may justly be compared with Schiller's. In the case of both, it is evident that the sublime, the ideal, and the noble in art, instead of repelling or intimidating, as might have been anticipated, attracted the masses even more than its popular forms. The truth is, that men feel more gratitude, respect and love for the mind which uplifts them to itself and impresses them with the feeling that there is in them something akin to a higher nature, than for one which descends to their level.

Virgil's poetry made its way into all educational circles and into all strata of society ; artisans and shopkeepers had his verses constantly on their lips and used them as mottoes. Even the most ignorant could quote scraps from the *Aeneid*, and at banquets where the guests were entertained with jugglers' tricks, imitations of animals' voices and farcical performances, pieces from the *Aeneid* were recited, although, no doubt, atrociously. Like the Bible in modern times, the works of Virgil were opened in times of anxiety, and the first passage on which the eye lighted was regarded as an oracle of destiny ; this method of divination was also practised in Renaissance times. In literary circles his birthday (October 15), was kept by a number of admirers, and the temple oracles (e.g., those of Praeneste and Patavium as late as the third century) gave their responses in the words of Virgil.

No other poet, as we have remarked, attained such unexampled popularity ; but the walls of Pompeii show that Propertius and Ovid also were widely known. Here, in addition to lines from Virgil (some obviously written by schoolboys), verses from these and other poets have been scrawled with the stylus, partly word for word, partly parodies, especially in the Basilica, which was used as a fashionable promenade. Jacob Grimm's remark in reference to Schiller may explain their popularity. 'The multitude is pleased with the poetry which in style and ideas reaches the high level of modern education ; the old-fashioned manner of the past seems strange to the people, which desires to be initiated into the standpoint of the present'. 'The multitude, which is affected by a beautiful poem, desires to enjoy it with all modern advantages, and is ready to renounce the old'.

Even in ancient times, the people of Italy were probably as impressionable to poetry as at the end of the sixteenth century, when Tasso's *Jerusalem* so rapidly became popular, and Montaigne was astonished to hear shepherdesses singing Ariosto. The influence of the school, which was practically non-existent in more modern times, must have made the poetry of the Augustan age far more widely known in the first two centuries. The theatre, where probably poems were often sung, also co-operated with the school ; and their joint influence depended partly on the delight felt by southerners in euphony and rhythm ; although at the present day the rapturous

delight even of educated Italians in the national poetry is tinged with sensuality. But in ancient times the feeling for euphony and rhythm was far finer and more developed, and demanded satisfaction even in prose, in a still higher degree among the Greeks than among the Romans. Their lively sense of mere euphony is shown, e.g., by the mention in Philostratus of the welcome given in Rome to the Phoenician Hadrianus, professor of eloquence under Marcus Aurelius and Commodus. Knights and senators directed that they should be summoned from the theatre when he began his lectures, and flocked to the Athenaeum, even if they did not understand Greek. People admired his harmonious voice, its cadence, the modulated rhythm of his delivery ; he was listened to with as much delight as the tuneful nightingale.

But apart from all favourable accessory circumstances, the effects of the classical poetry of the Augustan age on the educated world of the period immediately succeeding must have been enormous. This period was essentially unproductive, but possessed the delicate sensitiveness associated with high culture. At such a time, the production of numerous perfect works of art, the establishment of standard forms for its various departments, but above all, the creation of a new poetical language, full of enchanting beauty and dazzling brilliancy, was bound to call forth the instinct of assimilation and imitation most strongly and in the fullest extent. 'All men', says Goethe, 'have an inexpressible taste for the enjoyment of works of art ; but man learns nothing and enjoys nothing, without at once desiring to produce something himself. This is the most deep-seated peculiarity of human nature ; it is no exaggeration to say that it is human nature itself'. Thus, at every period of high culture, a wide-spread dilettantism is the necessary consequence of a great and abundant development of art. This has been the experience of Germany, especially in the domain of poetry. She has enjoyed a golden age of poetry without parallel, which gave her a poetical language. But succeeding generations displayed an excessive eagerness to obtain assured possession of the precious heritage, by unceasing use and abuse of it, and by continual reproduction. Although we have no express testimony, we may assume a similar state of things for the post-Augustan age. The temptations due to a cultivated language were as irresistible
